

THE ATOMIC BOMB THAT ENDED THE WAR

wiped out the city of Nagasaki, and blasted the basis of our former World Order of existence. The second atomic bomb attack, August 9. The smoke did not even begin to billow out till it passed through cloud layers at 20,000 feet. (Acme—U.S.A.A.F.)

THE NEW INTERNATIONAL Year Book

A COMPENDIUM OF
THE WORLD'S PROGRESS
FOR THE YEAR
1945

FOREWORD

Once again this YEAR BOOK carries the record of all important events throughout the world of the year just finished—a complete record, from January 1st to December 31st. But, whereas the volumes for the years of war, through military strictures, were necessarily silent on some matters of the highest strategic importance, the present record is able to lift the veil and to disclose vital happenings during those years that reached their climax in 1945. Thus, both as a chronicle of the closing victorious days of the most devastating war in all history, and as a final summary of political, military, scientific, and technological activities which combined to achieve that victory, this present YEAR BOOK is the most important of its long line.

In accordance with past practice, the Editors have consistently sought the most informed authorities to contribute to these pages. Space does not permit a listing here even of the many whose names have been added to the notable list of previous volumes. In their respective fields these names are familiar. Many of the contributors, those of longer standing as well as later ones, are men or women of national and international reputation. The Editors are gratified to be able to present their well-informed summations of the events and developments of 1945.

A feature in this volume that will be welcomed by many consultants of previous volumes in the series is the Index. This replaces the older system of extensive cross references. The Editors ask the indulgence of those consultants who preferred the strictly alphabetical scheme made possible by cross references, but rising costs of production have necessitated a less involved method of printing.

CHARLES EARLE FUNK

HENRY WYSHAM LANIER

LIST OF CONTRIBUTORS

- Nicholson B. Adams, Ph.D.**
Professor of Spanish, University of North Carolina; Author, The Heritage of Spain
 SPANISH LITERATURE
- Walter M. Albee, A.B., A.M.**
Editorial Assistant, New International Year Book
 NECROLOGY
- Arthur J. Altmeyer**
Chairman, Social Security Board
 SOCIAL SECURITY BOARD
- P. N. Annand, B.S., M.A., Ph.D., D.Sc.**
Chief, Bureau of Entomology and Plant Quarantine, U.S. Department of Agriculture
 INSECT PESTS AND PLANT QUARANTINES
- Harry J. Anslinger, LL.B.**
Commissioner, Bureau of Narcotics, Treasury Department
 NARCOTICS, BUREAU OF
- Gladys Auslander**
Editorial Assistant, New International Year Book
- A. D. Battey**
Statistician, National Safety Council
 ACCIDENTS
- Arthur Beach**
Review Secretary, National Board of Review of Motion Pictures
 MOTION PICTURES
- James V. Bennett, A.B., LL.B.**
Director, Bureau of Prisons, U.S. Department of Justice
 PRISONS, PAROLE AND CRIME CONTROL
- Arthur V. Berger, B.S., M.A.**
Music critic, The Sun, New York
 MUSIC
- John B. Blandford, Jr.**
Administrator, National Housing Agency
 NATIONAL HOUSING AGENCY
- Joseph P. Blank**
Editorial Assistant, New International Year Book
 RUBBER; SPORT RECORD; UNITED NATIONS ORGANIZATION
- Jules I. Bogen, B.S., A.M., Ph.D.**
Editor, The Journal of Commerce; Professor of Finance, New York University
 BANKS AND BANKING; BUSINESS REVIEW; FINANCIAL REVIEW; FOREIGN EXCHANGE; PUBLIC FINANCE; TAXATION
- O. A. Bontempo, A.B., Ph.C.**
Contributing staff, Modern Language Journal; Director, The Language Workshop, College of the City of New York
 ITALIAN LITERATURE
- Hugh G. Boutell**
Chief, Information Section, National Bureau of Standards
 NATIONAL BUREAU OF STANDARDS
- Chester Bowles**
Administrator, Office of Price Administration
 PRICE ADMINISTRATION, OFFICE OF
- Omar N. Bradley**
General, U.S. Army; Administrator, Office of Veteran Administration
 VETERANS' ADMINISTRATION
- Lyman Bryson**
Director, Educational Division, Columbia Broadcasting System; Professor of Education, Columbia University; President, American Association for Adult Education
 INTERNATIONAL COURT OF JUSTICE
- A. S. Burack**
Editor, The Writer
 MAGAZINES
- Vannevar Bush**
Director, Office of Scientific Research and Development, Washington, D.C.
 SCIENTIFIC RESEARCH AND DEVELOPMENT, OFFICE OF
- Antonio J. Cárdenas**
Managing Editor, Editors Press Service
 LATIN-AMERICAN ART
- Ralph W. Carey, A.B.**
New York Drama Correspondent, The Hartford (Conn.) Courant
 THEATER
- Ugo Carusi**
Commissioner, Immigration and Naturalization Service, U.S. Department of Justice
 IMMIGRATION, EMIGRATION AND NATURALIZATION
- Arthur P. Chew**
Special Writer, Office of Information, U.S. Department of Agriculture
 AGRICULTURE; AGRICULTURE, U.S. DEPARTMENT OF; NEW PLANTS FOR THE UNITED STATES
- Kenneth Colegrove, Ph.D.; Litt.D.**
Professor of Political Science, Northwestern University; Secretary-Treasurer, American Political Science Association
 AERONAUTICS
- John Caskie Collet**
Stabilization Administrator, Office of Economic Stabilization
 STABILIZATION ADMINISTRATOR, OFFICE OF
- Fred H. Colvin**
Author; Editor Emeritus, American Machinist; Consulting Engineer
 MACHINE BUILDING
- Alzada Comstock, Ph.D.**
Professor of Economics, Mount Holyoke College
 AUSTRALIA; BRITISH EMPIRE; BURMA; CANADA; EIRE; GREAT BRITAIN; INDIA; IRELAND, NORTHERN; NEWFOUNDLAND; NEW ZEALAND; SOUTH AFRICA, UNION OF
- Joseph E. Davies, A.B., LL.B., LL.D., Ph.D.**
Chairman, The President's War Relief Control Board; Author, Mission to Moscow
 WAR RELIEF CONTROL BOARD
- Watson Davis**
Director, Science Service, Washington, D.C.
 PHYSICS

Contributors to the New International Yearbook—Continued

Wendell Phillips Dodge
Commander, U.S.N.R. (Ret.); Explorer; Editor,
Marine News, New York
 SHIPBUILDING; SHIPPING, U.S.

GLOSSARY

OF IMPORTANT NEW WORDS AND WORDS IN THE NEWS

Compiled by HAROLD WARD

- actin.** A protein which, in conjunction with another protein, myosin, is active in the phenomenon of muscle contraction.
- aerogeology.** The investigation of geological formations by means of aerial photography: used especially in the location of rock structures indicating the existence of new oil or ore deposits.
- airbrasive.** A dental method for grinding down the hard material of teeth by a finely powdered abrasive directed against the surface under air pressure.
- amigen.** A predigested protein obtained from the pancreas of the hog: used in the treatment of severe malnutrition, extensive burns, and for the relief of pain from stomach ulcers.
- ANRAC.** A contraction of Aids Navigation Radio Control, a method of controlling the operation of buoys, lighthouses, foghorns, and other navigation aids by means of coded radio signals.
- ANTU.** A contraction of alpha-naphthyl thiourea: a powerful rat poison recently developed in the U.S.
- aquiculture.** The raising of fish in farm ponds, using selected plant and other food.
- ARO.** Airborne Range Only: describing radar equipment for use with gun range-computers.
- "A" scope.** Radar data indicating only the distance to a target.
- Ascecal.** Assemblée de Constructeurs pour un Renouveau Architectural: a French organization for the promotion of broad public interest in all phases of postwar city planning.
- ASV.** Airborne Surface Vessel: radar equipment for locating surface ships, including submarines coming to the surface.
- Atcorob.** A device for the rapid and accurate reproduction of earth features in three-dimensional models. Name a contraction of the names of the three inventors: Major Atwood, Prof. H. L. Cooke of Princeton University, and Capt. A. H. Robinson, of the Office of Strategic Services. Compare *Orthojector*.
- axon bomb.** A 1,000-pound demolition bomb equipped with a radio device permitting remote control.
- BABS.** Blind Approach Beacon System: a method for directing aircraft to a landing field by radar.
- bactracin.** An antibacterial substance isolated from certain bacilli by American biochemists.
- bake bomb.** Name given by U.S. Marines to a Japanese rocket-propelled bomb guided to the target by a pilot who is locked in the cockpit.
- BAL.** Contraction of British anti-lewisite: a special alcohol developed by R. A. Peters, a British chemist. It is highly effective against arsenic poisoning and has been used also as an antidote against mercury.
- Benadryl.** Trade name for a synthetic drug having value in the relief of hayfever and hives.
- Biber.** The Beaver: a German one-man midget submarine.
- blip.** R.A.F. slang for radar signals caught on a cathode-ray tube.
- bobbing.** The fluctuation of radar echoes due to the alternate interference and reinforcement of the reflected waves.
- bonzo.** See *proximity fuze*.
- BRL.** Barge, Refrigerated, Large: an auxiliary vessel of the U.S. Navy designed to carry 64 carloads.
- "B" scope.** Radar data providing both the range and azimuth of the target.
- calutron.** An electromagnetic device for the separation of isotopes; developed in the production of U-235. Name a contraction of California University cyclotron.
- carbon 13.** A heavy isotope of carbon; chemically indistinguishable from ordinary carbon, its use as a tracer element will permit close study of many physiological processes.
- chemotronics.** A field of research which combines the fundamental knowledge of electronics, superconics, and chemistry, with special emphasis on the development of new industrial products.
- conun.** In full, conundrum: one of the huge floating drums, on which were wound the 500 miles of oil pipelines laid across the English Channel in Operation Pluto.
- "C" scope.** Radar data giving the elevation angle and the azimuth of the target.
- clutter.** A distorted radar image caused by jamming, noise, or continuous echo.
- CRT.** Cathode-ray Tube: the oscilloscope indicator tube used in radar. Also called *scope*.
- cyclops camera.** A miniature camera attached to the center of the forehead for the instantaneous photographing of any scene viewed through a focussing element set in one lens of a pair of spectacles.
- DD.** Dichloropropane dichloropropylene, an insecticide related to DDT, especially effective against wireworms and the hard-shelled larvae of click beetles.
- DD tank.** The Duplex-Drive military tank, developed in 1941 by the British inventor, Nicholas Strausler. A collapsible canvas screen, when inflated, completely surrounds the tank above the tracks, thus enabling it to float.
- discography.** An annotated list of phonograph records.
- DSM Project.** Development of Substitute Materials Project, charged with executing the secret work on atomic bombs directed by the Manhattan District of the U.S. Army Corps of Engineers.
- Eniac.** An electronically operated computing machine designed to solve very complex mathematical problems at high speed. Invented and built by Dr. John W. Mauchly and J. Presper Eckert, Jr. The name is from the initials of the words "electronic numerical integrator and computer."
- Eureka.** A lightweight, battery-operated radar beacon device designed for use by paratroopers.
- faceometer.** An instrument for measuring the principal dimensions and physical characteristics of the

- face:** used by the U.S. Chemical Warfare Service to determine different styles and sizes for gas masks.
- fagarine.** A new drug developed by Argentine scientists as a possible substitute for quinidine in the treatment of certain heart diseases. It is extracted from the leaves and twigs of a tree, *Zanthoxylum fagara*, growing in Argentina.
- Fastax.** Trade name for a series of high-speed motion picture cameras which can take up to 8,000 pictures per second.
- Ferret.** An airplane specially equipped with electronic devices for detecting enemy radar and radio installations.
- Fido.** A British World War II device for the dispersal of fog above airfields by the heat from a system of oil-burning jets arranged along the runways and operated from a central control board. The name is a contraction of Fog, Intensive Dispersal Of (sometimes, Fog Investigation and Dispersal).
- Fireball.** A single-seat, low-winged, fighter airplane which combines propellers with jet propulsion; developed for the U.S. Navy but never used in actual combat.
- Fortical.** Trade name for a tough, durable, lightweight plastic made from cellulose and propionic acid.
- frog men.** Men specially trained in underwater demolition work for the Allies in World War II; they wore rubberized diving suits with broad, paddle-shaped feet, helmets, and oxygen respirators to permit long submersions over large areas.
- gadol.** Vitamin A as extracted from codfish; name derived from *gadus*, scientific name of the codfish, and proposed by American biochemists in distinction from its twin form, galol.
- galol.** A new form of Vitamin A isolated from shark liver by American biochemists and so named to distinguish it from gadol, the usual form. Derived from *galeos*, Greek word for shark.
- GCA.** Ground Controlled Approach: radar landing equipment operated from the ground.
- GCI.** Ground Controlled Interception: ground-operated radar equipment for signalling the position of enemy aircraft to fighter planes.
- gee.** A system for the accurate navigation of aircraft by means of radio signals transmitted from a network of ground stations. First developed by a British inventor, R. J. Dippy, and independently in the U.S. under the name *loran*.
- genocide.** The deliberate extermination of racial or national groups; used by the War Crimes Commission in London in connection with the trials of Nazi war criminals.
- geoscience.** The earth sciences, considered collectively, including topography, mapmaking, etc.
- Guidex.** Trade name for an indexing system which is printed on the extended foredge of a book; designed by H. E. Oppenheimer and adapted especially for dictionaries, directories, and the like.
- Gumbatsu.** The military aristocracy of Imperial Japan.
- Hais cable.** The flexible 2-inch oil pipeline constructed on the principle of the cable and used by the British in the preliminary work connected with Operation Pluto. The name is a contraction of Hartley, Anglo-Iranian, Siemens.
- Hamel pipe.** The 3-inch oil pipeline which was laid across the English Channel immediately after D-day, in connection with Operation Pluto. The name is a contraction of Messrs. H. J. Hammick and B. J. Ellis, the British oil engineers who designed the pipe.
- huff-duff.** An electronic device for intercepting radio signals within a wide radius and accurately locating their point of origin by means of indications on a cathode-ray tube. It operates from a series of interconnected ground and ship stations, and was developed in the United States as a countermeasure against Axis submarines.
- hypholin.** A substance of undetermined medical value isolated by British workers from the same mold fungus that yields penicillin.
- IFF.** Identification, Friend or Foe: any of variously designed and operated systems using radar for the identification of ships and aircraft. See also *racon*.
- Illinois virus.** A virus resembling that which causes parrot fever and believed to be responsible for a type of pneumonia; discovered by Drs. J. Zichis and H. J. Shaughnessy, of the Illinois State Health Department.
- interrogator.** The radar transmitter used in IFF system to challenge suspected ships or aircraft.
- IRIS.** Interim Research and Intelligence Service: succeeding the Office of Strategic Services (OSS).
- isotron.** An apparatus designed for the electromagnetic separation of uranium isotopes during the process of making atomic bombs. Method suggested by R. R. Wilson, of Princeton University, who also coined the purposely meaningless name.
- Kambatsu.** The bureaucratic governmental clique of Imperial Japan.
- Kimpai.** The secret military police of Imperial Japan, similar to the Nazi Gestapo.
- kith.** A sociopolitical group smaller than a race and considered as a basic unit in human civilization. It is relatively homogeneous in culture and language, practises intermarriage, and is assumed to possess ethnic superiority by virtue of its biological inheritance. Term used by Ellsworth Huntington.
- Kolkhozniisa.** A new type of portable water turbine having a capacity of 20 to 60 kilowatts; designed and made in the U.S.S.R. as a general purpose turbine wherever water power is available.
- Kyodo.** A proposed Japanese news agency, modelled after the Associated Press and intended to replace the dissolved Domei service.
- LAB.** Low Altitude Bombsight, a device for connecting the bombsight to the radar unit in order to increase bombing accuracy at low altitudes. Developed for the U.S. Army by the National Defense Research Committee.
- lily.** A floating airstrip or airfield consisting of a series of hexagonal buoyancy drums laid upon the surface of the ocean and hinged together to provide a strong yet flexible support for aircraft.
- Littlejohn.** A device for increasing the effectiveness of anti-tank guns; the name conceals that of the Czech gun designer, Charles Janacek, who developed his invention in England. Also called Littlejohn conversion.
- loran.** A navigation system by which ships and aircraft are enabled accurately to determine their position by interpreting radar and radio signals transmitted irrespective of weather conditions from a network of ground stations. Name a contraction of *Long Range Navigation*.
- macrokith.** A sociopolitical group based upon and developed from a kith but incorporating various elements that give it a mixed or heterogeneous character, as the English, Prussians, Italians, etc.
- Manhattan District.** A division of the Corps of Engineers of the U.S. Army, established Aug. 13,

- 1942, to supervise all the activities connected with atomic bombs. See *DSM*.
- memex.** A mechanized apparatus for the storage of books, records, documents, etc., so classified and arranged as to permit quick consultation of any desired items by the manipulation of a system of controls connected with viewing screens.
- microkith.** A group developed from a kith by prolonged selective inbreeding; it is characterized by relatively small numbers exhibiting a high degree of cultural homogeneity, and it usually occupies a dominant sociopolitical position within a given society.
- Mombatsu.** The landed aristocracy of Imperial Japan.
- monocerin.** A new drug regarded as promising in the treatment of wounds and malaria; developed by Australian scientists at Sydney University.
- moonlight slaughterer.** An unregistered and illegal slaughterer who violates health regulations in the preparation of meat for the black market. Also called apple-tree slaughterer.
- motorjet.** A reciprocating engine combined with a ducted fan.
- Mulberry dock or harbor.** An artificial dock constructed of heavy concrete caissons acting as breakwaters, and equipped with floating piers for loading and unloading ships. Developed by the British in World War II and highly adaptable for use where there are no natural harbors.
- navar.** A method of improving the efficiency and safety of commercial aviation by an interlocking system of radar beacons operating from ground stations and connecting with receivers in aircraft. Developed by Henry Busignies of the International Telephone & Telegraph Corp. Compare *IFF* and *racon*.
- naviglobe.** A system of long-range radio beacons for the improvement of air navigation in all parts of the world. Compare *IFF* and *racon*.
- Navtechjap.** Contraction of United States Naval Technical Mission in Japan, operating to disclose Japanese naval secrets.
- neptunium.** An artificial element of atomic number 93, produced by the fission of the uranium isotope 235 and giving rise to plutonium by emission of a beta particle.
- Norelac.** A liquid plastic regarded as a useful substitute for shellac, especially in the coating of smoked-paper records, such as those made by a kymograph. Name a contraction of Northern Regional [Research Laboratory] lacquer.
- nucleonics.** Nuclear physics: that branch of atomic physics which investigates the structure, properties, and phenomena of the nucleus, especially in relation to the development of atomic energy.
- Oligopoly.** A monopoly, highly centralized in its management and operation through effective control by a very few acting primarily in their own interests.
- ORG.** Operations Research Group; a carefully selected body of scientists, technicians, and specialists in many fields, working in strict secrecy for the U.S. Navy on a wide range of wartime problems.
- Orthicon.** Trade name for an extremely sensitive television camera tube which uses low-velocity electrons in scanning and can pick up scenes under all lighting conditions or by infra-red radiations. Also Orthiconoscope, Image Orthicon.
- Orthoprojector.** A device for accurately projecting onto a relief model all the features shown on a map or photo transparency: designed and constructed by the inventor of the *atcorob*.
- Ortho-Rater.** Trade name for a high-precision optical device for correlating visual ability with various types of manual and mental work.
- paludrine.** An antimalarial synthesized from coal tar by British workers and regarded as more effective than atabrine.
- Penetron.** Trade name for an instrument in which radium is used to determine the thickness of metal plates by the amount and intensity of the back scattering from the penetrating gamma rays.
- Perbunan.** Trade name for an oil-resistant synthetic rubber which retains its flexibility at very low temperatures and can be made self-sealing against punctures, bullet-holes, etc. A member of the Buna-N group of synthetic rubbers.
- periston.** A synthetic chemical, polyvinyl pyrrolidone, used by the Germans in World War II as a substitute for blood plasma in the treatment of shocks; rejected by American medical scientists.
- Plesiothropus.** An extinct animal regarded as intermediate between man and ape; it is represented by skull fragments, brain cast, and a few teeth discovered near Johannesburg, South Africa, by Dr. Robert Broom.
- Plexon.** Trade name for a plastic-coated yarn developed in the United States by two French chemists. The yarn may be of rayon, cotton, or Fiberglas, and the coating of plastic makes it waterproof, rustproof, immune to temperature extremes, and resistant to mild acids or alkalis.
- Pluto.** Contraction of Pipeline Under The Ocean—also called Operation Pluto. The oil pipelines laid by the British across the English channel to ensure a continuous supply of oil to the Allies after D-day.
- plutonium.** An artificial element of atomic number 94, produced from uranium by the disintegration of neptunium.
- polytron.** A hypothetical, short-lived atomic particle regarded as a combination of the electron and the positron; its existence was suggested by Prof. J. A. Wheeler, of Princeton University. Alternative names are *electromeson* and *polyelectron*.
- PPI.** Plan Position Indicator: an apparatus for determining the direction and range of a target by causing radar echoes to indicate its position on the face of a cathode ray tube.
- Precepitron.** Trade name of an electronic filter for removing dust, pollen, and other impurities from air, rugs, fur, etc.; developed by G. W. Penney of the Westinghouse Co.
- Pressuregraph.** Trade name for an electronic device that records on a cathode-ray oscillograph the pressure-time curve of any enclosed pressure system, or an internal combustion engine.
- Promin.** A chemical reported by the U.S. Public Health Service in the treatment of leprosy. It is distantly related to the sulfa drugs and was first discovered in 1938 by Drs. Louis Bambas and Leon Sweet of the Parke-Davis Co.
- proximity fuze.** A complete miniature radio set placed in the nose of a projectile and capable of detonating the charge by simple proximity to the target. Developed since 1940 by the Office of Scientific Research and Development. Known as the *VT fuze*, and in England as *bonzo*.
- pulse-position modulation.** A type of frequency modulation (FM) in which impulses of very short wavelength and great stability are transmitted between stations spaced at varying distances. Now being adapted to the radio transmission of multiple telephone, telegraph, teletype, or similar communications over a network of channels connecting the wired portion of the system.

pulsejet. An engine operating by means of an intermittent jet.

recon. Contraction of radar beacon: a World War II device for the immediate identification of friendly or hostile aircraft by means of radar signals automatically transmitted in code. Also adapted to the safe navigation of ships and aircraft. Compare *IFF*.

radome. The housing which encloses the scanning unit of a radar set.

ramjet. An engine operating by a continuous jet, with compression of a hydraulic ram.

RAPWI. Recovery of Allied Prisoners of War and Internees: an organization operating in former Japanese-held territory.

rasen. A method of obtaining and recording weather information at high altitudes by combining a radiosonde with automatic signal recording devices and ground radio-direction finders. Developed by U.S. Weather Bureau. Name a contraction of "Radiosonde and Radio Winds Aloft Observation," sometimes called *rawinsonde*.

rawinsonde. See *rasen*.

Rebecca. An airborne radar device operating in conjunction with ground equipment to obtain range and azimuth data on the beacon.

Redux. Trade name for a strong, durable adhesive consisting of a liquid resin spread over the surface and sprinkled with a powder, heat being applied to ensure bonding.

reslooming. A method of strengthening and protecting textile fabrics by impregnating them with a chemical that is resistant to water, heat, and injurious chemical action.

resatron. A special vacuum tube having a wide frequency range and modulation output, designed in the U.S. for use with the powerful radar-jamming station located in England. See *RUSA*.

responder. A radar receiver for intercepting signals transmitted in reply to a challenge sent out by the interrogator.

Rotascope. Trade name for an optical device which permits the continuous study of a rotating object at any given point in its path of travel.

SALP. Contraction of sodium-antimony-lactophenate: a liquid insecticide regarded as effective against chewing insects.

schmorkel. German device for enabling submarines to remain submerged without cutting diesel engine. An air Mast (See *YEAR BOOK*, 1944, p. 729).

scope. A cathode-ray tube indicator, as used in radar.

Seehund. The Seal, a small German two-man submarine, about 40 feet long, having a surface speed of 8 knots and armed with two electric torpedoes.

servomechanism. Any of various automatic control devices.

shoran. Contraction of short-range, an air navigation system using radar in connection with ground stations located within a 250-mile radius.

sigmatron. An atom-smashing machine which consists of a cyclotron and a betatron operating in tandem to produce X-rays with a potential of one billion volts. Developed by Dr. E. E. Charlton of the General Electric Laboratories.

Slobok. A cultivated variety of lettuce claimed not to go to seed in warm weather.

SN 7618. A synthetic chemical regarded as better than atabrine and quinine in the treatment of malaria. First developed by German chemists, but its anti-malarial value recognized by American chemists.

snowmobile. A motor vehicle running on wide caterpillar treads and especially designed for travel

across snow and ice. Based on the U.S. Army amphibious vehicle the water weasel and used in Canada.

sofar. A system for locating stranded ships or aircraft by means of underwater sound waves, set up by high explosive depth charges released by the survivors, and detected by hydrophones on widely separated shore stations. Developed by the U.S. Navy and the Woods Hole Oceanographic Institution. Name from the initials of Sound Fixing and Ranging.

Sommerfeld track. A portable road or runway invented by K. J. Sommerfeld, an Englishman and widely used by the allies in World War II. It is composed of uniform lengths of wire netting reinforced with steel rods having loops at the ends, and a completed section can support the heaviest traffic over rough, muddy, or marshy ground.

Stabinal. Trade name for a pine resin mixed with Portland cement and applied to dirt surfaces to prevent mud formation by waterproofing the soil.

stereophon. A method for recording the range and intensity of sound on a track having a total width of 2.65 millimeters.

Stratovision. Trade name for a method of long-range television by relaying the initial ground transmission from aircraft cruising at a height of about six miles. Each air station would have a range of about 200 miles.

streptomycin. A substance found in a mold-like organism (*Streptomyces griseus*) and regarded as a promising antibacterial drug, especially in the treatment of typhoid and certain other diseases immune to penicillin.

Swiss roll. A floating pier or runway consisting of a roll of flexible canvas with wooden cross-pieces. Laid upon the surface of a body of water, it will bear the weight of heavy traffic by increasing the normal surface tension of water. Invented by an Englishman, R. M. Hamilton. Compare *L.L.V.*

syton. See *reslooming*.

transponder. The element in the *IFF* radar system which receives the challenge transmitted from a beacon and automatically sends a reply.

Tridione. Trade name for a synthetic drug reported to give encouraging results in the treatment of petit mal epilepsy, according to Dr. Wm. G. Lennox, of the Harvard Medical School.

tuba. A very high power, land-based radar transmitter developed by Britain and the U.S. as a counter measure against German radar signals.

turbopan. A gas turbine combined with a ducted fan.

turbopjet. A gas turbine connecting with a jet.

turboprop. A gas turbine connecting with a propeller.

tympanometer. An electronic instrument for automatically indicating physiological accommodation to changes in air pressure as shown by the act of swallowing. It consists of two earpieces equipped with diaphragms which respond to and transmit the vibration impinging on the eardrum (tympanum) each time the subject swallows.

USAT. United States Army Thickener: jellied gasoline, used in incendiary bombs. Developed by Louis F. Fieser, American chemist.

VHF. Very High Frequency: applied to very powerful and penetrating radar waves.

VI fuze. Variable time fuze. See *proximity fuze*.

vocoder. A combination microphone and typewriter by means of which spoken words may be automatically converted into typed words; under development by Bell Telephone Laboratories.

MEMORABLE DATES OF 1945

- Jan. 1.** France formally joined the United Nations. U.S. armed forces announced as totalling 11,900,000. Census Bureau reported 155,000 separate governmental bodies functioning in U.S. War Production Board reported 96,869 planes produced in 1944.
- Jan. 3.** Premier Koiso told Japan "the losses sustained by our Navy (in 1944) were by no means small."
- Jan. 9.** U.S. Sixth Army landed successfully on Luzon. Army transport flew from Seattle to Washington, D.C. in 6 hours and 9 minutes.
- Jan. 11.** Greek Elia and British Army signed truce ending civil war that began in early December.
- Jan. 17.** First White Russian army captured Warsaw, 5 years and 4 months after it fell to the Germans.
- Jan. 24.** German army, retreating from the Belgian salient, lost 5,500 vehicles, and 127 tanks and armored cars in two days' battering by U.S. planes.
- Feb. 5.** Gen. MacArthur announced capture of Manila.
- Feb. 12.** Officially announced that Roosevelt, Stalin and Churchill signed a number of basic agreements at Yalta. U.S. federal tax yield in 1944, \$42,125,986,550.
- Feb. 13.** Soviet troops captured Budapest.
- Feb. 20.** Lend-Lease to Allies, \$35,382,000,000, and rumors of shortages caused by this "greatly over-stated in false rumors," said FEA.
- Feb. 27.** Civil government of Philippines turned over to President Osmena.
- Feb. 28.** Army Air Forces announced their first jet-propelled plane, the P-80 Shooting Star. President Vargas announced Brazil's forthcoming first election in 15 years.
- Mar. 1.** Generalissimo Chiang announced a coming national constitutional assembly in which all parties would have equal status.
- Mar. 3.** Nineteen Pan-American nations approved the Act of Chapultepec.
- Mar. 3.** Red Army reached Baltic, splitting Germany.
- Mar. 4.** Saudi Arabia became 45th member of U.N.O.
- Mar. 5.** American 1st Army crossed Rhine at Remagen. Chinese troops take Lashio in Burma.
- Mar. 12.** Four major Hollywood studios shut down by strike of 15,000 AFL workers.
- Mar. 13.** Queen Wilhelmina returns to The Netherlands after 5 years' absence.
- Mar. 17.** Conquest of Iwo Island completed. U.S. individuals held in cash and deposits and Government bonds 148 billion dollars.
- Mar. 23.** Cabinet announced French Empire is to be known in future as French Union, with Indochina having limited self-government.
- Mar. 26.** U.S. Senate passed bill raising national debt limit to 300 billions.
- Mar. 27.** Argentina declared war on Japan and Germany. Red Army fought way into Danzig.
- Apr. 1.** War Crimes Commission declared leaders of enemy governments not immune, Hitler heading one list.
- Apr. 2.** Supreme Court, 5 to 4, upheld Federal Power Commission in reducing rates for natural gas. Gen. de Gaulle told France it "must rely on itself alone if it is to occupy the place it desires."
- Apr. 4.** Argentina signed Act of Chapultepec.
- Apr. 5.** Soviet Union denounced pact with Japan. Soviet Army reached Vienna. Japanese Koiso Cabinet resigned.
- Apr. 10.** Lend-Lease Act extended for another year.
- Apr. 12.** President Roosevelt died, and Vice-President Harry S. Truman succeeded to the Presidency.
- Apr. 14.** Stalin agreed to send Foreign Commissar Molotov to the United Nations Conference at San Francisco.
- Apr. 16.** After three years, the Burmese port of Taungup fell to British.
- Apr. 17.** Gandhi declared Indian delegation to San Francisco only a camouflage, saying representatives should be elected.
- Apr. 18.** U.S. Third Army entered Czechoslovakia, cutting Germany in two.
- Apr. 20.** U.S. Seventh Army took Nuremberg.
- Apr. 21.** Russian troops entered Berlin.
- Apr. 23.** Britain's five-year blackout ended, except for a five-mile coastal strip.
- Apr. 25.** Delegates of 46 United Nations met in San Francisco to draw up a Covenant.
- Apr. 26.** British Second Army captured Bremen.
- Apr. 27.** Russian and Allied armies joined at Torgau on Elbe. American Fifth Army took Genoa. Statistics showed strikes and lockouts caused 880,000 lost man-days in March.
- Apr. 28.** Mussolini executed by Italian Partisans.
- Apr. 30.** Munich captured by Seventh Army. Gen. Mark Clark declared German Army in Italy no longer existed as a military force.
- May 1.** Borneo invaded.
- May 2.** German forces in northern Italy and western Austria surrendered unconditionally. Berlin fell to the Russians.
- May 3.** British Third Army took Rangoon.
- May 4.** German forces in Netherlands, Denmark, and northwestern Germany surrendered to Marshal Montgomery.
- Secretary Ickes seized 33 more idle soft coal mines, making a total of 272.
- May 5.** German First, Nineteenth and Twenty-fourth armies surrendered to American Seventh and French First, leaving but one German army opposing Allies. Czechoslovak resistance forces took over Bohemia and Moravia, established Prague again as capital.
- May 8.** Secretary Morgenthau announced the war against Germany cost the United States 275 billions.
- May 9.** Director Fred Vinson reported Americans still faced shortages of food, clothing, shelter—and especially sugar. Formal German surrender signed in Berlin.
- May 9.** Midnight entertainment curfew and ban on racing removed.
- May 10.** President Benes and Cabinet arrived in Prague.
- May 12.** Eire removed its five-and-a-half year censorship.
- May 14.** Chinese troops re-occupied Fochow. Socialist party led in French municipal elections, with Communists a close second.
- May 15.** France announced as fifth permanent member of the United Nations Security Council.
- May 21.** Syria and Lebanon broke with France, claiming independence. OPA increased basic steel price \$2 to \$7 a ton.
- May 23.** Prime Minister Churchill resigned; election fixed for July 5. Heinrich Himmler committed suicide after capture.
- May 24.** German war dead estimated at 4,000,000 soldiers and 500,000 civilians.
- May 30.** General Le May announced destruction of 51 square miles of Tokyo by B-29 raids.
- May 31.** Combat casualties of American armed forces totaled 1,002,887. At Churchill's request Gen. de Gaulle issued a cease fire order to French troops in the Levant. Norwegian government returned, after five years' exile in England.
- June 3.** Russia stated its Communist party had increased from 3 million members in 1940 to 5 million.
- June 4.** U.S. and Great Britain appealed directly to Stalin to end Conference deadlock over right to veto discussion of international disputes. Denmark invited to San Francisco Conference.
- June 8.** Revealed that Nazis exterminated 80 per cent of German Jews, planned to eliminate all remaining in occupied Europe by summer of 1946.
- June 10.** Peruvians voted in first open election in 14 years.
- June 12.** World Court statute completed by United Nations Committee of Jurists.
- June 14.** Belgian Cabinet resigned in protest against King Leopold's return to throne.
- June 17.** Parri, northern Partisan leader, chosen Premier of Italy, all National Liberation parties to be represented.
- June 18.** Supreme Court ruled AP must disregard possible competition in passing on new members.
- June 19.** Big Five decided Axis countries should not be admitted to UNO until invited by Security Council.
- June 20.** WPB authorized 10 automobile companies to produce 691,018 cars between July, 1945, and March, 1946.
- June 22.** WPB stated lumber shortage was worst since 1940.
- June 23.** Moscow announced the new, democratized Polish National Government.
- June 24.** Over 87,000 workers idle through labor disputes.
- June 26.** Wages of 1,400,000 federal workers increased 15.9 per cent by Congress. Churchill declared Britain had been living on the bounty of the U.S. and must become independent.

Memorable Dates of 1945—Continued

- Fifty United Nations, beginning with China, signed the Charter at San Francisco.
- June 29.** All India Congress and Moslem League announced inability to agree on list of ministers for a new government under Wavell-Amery plan.
- June 30.** British Admiralty disclosed giant causeway built, linking five Orkney Islands, to block enemy entrance to Scapa Flow base.
- July 1.** Chinese took Litchow, former American air base.
- July 3.** U.S. Treasury announced government spending for first time passed a hundred billions a year.
- July 4.** Americans took control of over one-fourth of Berlin, British slightly less.
- July 5.** Britain and U.S. recognized new Polish Provisional government.
- Argentine press muzzled by censorship.
- Britain voted to elect thirty-eighth Parliament.
- Henry Morgenthau resigned as Secretary of Treasury.
- July 6.** President Benes announced that the 8,000,000 Sudeten Czechs who accepted German citizenship will be deported to the Reich within a year and a half.
- Japanese casualties in China estimated at 2,521,787; Chinese at 3,178,063.
- July 10.** The Big Three reached an interim settlement on the feeding of Berlin.
- Seventh War Loan Drive surpassed its goal of \$14 billions by \$12 billions.
- July 11.** The British Ministry of Information announced that the British Empire war casualties up to May 31 totalled 1,427,634 which included 146,760 civilians.
- July 12.** Navy announced that, since Pearl Harbor, navy and marine planes destroyed 17,000 enemy planes at a loss of 2,700 of their own. The Army lost 4,226 planes while eliminating 10,173 Japanese.
- Plot to overthrow Eamon de Valera was smashed.
- Representatives for organizations with 80,000,000 members urged ratification of United Nations Charter in Senate.
- July 14.** S.H.A.E.F., Allied European headquarters, was dissolved.
- Italy declared war on Japan.
- July 15.** King Leopold stated he would neither return to Belgium nor abdicate.
- The War Department announced the Army shipment of 2,045,829 tons of food to liberated European civilians during last year and a half.
- July 17.** Big Three met in Potsdam; President Truman presided.
- Minister of Labor Bevin declared Britain can solve postwar problems only by public ownership of major industries.
- Franco promised Spain return of monarchy.
- July 19.** U.S. Senate passed Bretton Woods measure by 61 to 16.
- July 20.** President Truman at Berlin said the U.S. wants neither territory nor money from the war.
- July 23.** Marshal Pétain went on trial.
- Fred M. Vinson became fifty-third Secretary of the Treasury.
- July 25.** Russia requested \$700 millions relief from UNRRA.
- July 26.** British Labor Party won overwhelming victory with 11,962,678 out of nearly 25,000,000 votes cast and gathered 888 of the 640 seats in the House of Commons.
- Japan given surrender ultimatum.
- July 27.** Prof. Laski claimed major aim of British Labor government was to rid Spain of Nationalist government.
- American Communists reconstituted the Communist Party.
- July 28.** U.S. Senator ratified United Nations Charter.
- Attlee replaced Churchill at Potsdam Conference.
- Canada's imports from the U.S. rose from \$498,900,000 in 1939 to \$1,447,200,000 in 1944. Her exports rose from \$578,000,000 to \$1,444,000,000.
- July 29.** Germany's casualties exceeded 4½ millions.
- July 30.** The Arab office in London said Near East will never accept Palestine as a Jewish homeland.
- Egypt delivered a request to Britain for greater independence and relief from all foreign troops.
- July 31.** Laval surrendered to U.S. Army.
- U.S. spent \$50 billions abroad in 4½ years and received \$8.8 billions.
- Aug. 1.** Total federal expenditures for the fiscal year ending June 30 was estimated at \$85,288,000,000.
- Aug. 2.** Potsdam Conference reached Big Three agreement on reparations, territorial control affecting Russia, Poland, control of Germany and war criminal trials.
- Aug. 3.** President Truman stated there were no secret agreements made at Potsdam.
- Aug. 6.** A new weapon, the atomic bomb, pulverized 60 per cent of Hiroshima in Japan.
- Aug. 6.** Russia resumed diplomatic relations with Finland and Rumania.
- Eisenhower said Germans in the American zone could "form local unions and engage in local political activities."
- Aug. 7.** Tito barred King Peter and "all reactionary emigrés" from Yugoslavia.
- Aug. 8.** Soviet Union declared war upon Japan, and at once attacked along the Manchurian border.
- Aug. 9.** Democratic forces of Argentina held first public meeting since Farrell became dictator.
- British elections returned to Parliament: Labor, 390; Conservative, 195; National, 2; Liberal National, 13; Communist, 2; Independent Labor, 3; Commonwealth, 1; Independent, 17.
- Aug. 10.** Statistics showed the War cost the U.S. over 251,000 combat dead, and 300 billions in actual war expenditures.
- Aug. 14.** President Truman announced Japan's reply constituted full surrender.
- Sir Stafford Cripps stated radar saved Britain, and played a greater part in the war than the atomic bomb.
- U.A.W. of CIO declared the no-strike pledge had ended.
- Aug. 15.** Soviet troops raced through Manchuria 100 miles a day on a 2800-mile front.
- Marshal Pétain convicted of treason and sentenced to death. (Two days later General De Gaulle commuted the sentence to life imprisonment.)
- Army procurement program cut 23½ billions.
- Aug. 16.** Turkey ratified United Nations Charter.
- Aug. 17.** France ratified the United Nations Charter.
- Aug. 18.** France by treaty returned to China Kwangchowang, formerly leased for 99 years.
- Surrender began of Japanese forces in Manchuria.
- Aug. 19.** Stated that the Allies sent 1,404,966 tons of civilian supplies into Italy from Badoglio's capitulation in 1943 to end of February, 1945.
- Moscow announced a new five-year plan.
- Aug. 20.** Secretaries of Army and Navy told Justice Dept the agreement to postpone 25 major anti-trust suits was no longer in effect.
- Aug. 22.** Henry Pu Yi, former "boy Emperor," and Japanese puppet in Manchukuo, interned.
- Aug. 23.** United Nations Charter unanimously ratified by British Parliament.
- Tokyo stated American bombings destroyed 44 cities, and killed, injured or made homeless ten million men, women and children.
- American, British, and French occupation forces entered Vienna.
- President Truman publicly denounced Franco and his Spanish government.
- Aug. 24.** Chiang Kai-shek signed Chinese ratification of United Nations Charter.
- Aug. 26.** Communist leader Mao Tse-tung complied with Chiang's third request to confer at Chungking.
- Amnesty for those guilty of taking hostages and damaging property declared by Greek government.
- Aug. 28.** U.S. troops landed in Japan for first military occupation in thousands of years.
- Labor Dept. announced 500 strikes in July, 1,500,000 man-days lost. Also that cost of living index in July reached 129.4 per cent of 1935-39 average—highest during war years.
- Aug. 30.** Secretary Byrnes stated whole Lend-Lease debt would not be cancelled; settlements would be negotiated.
- Aug. 31.** Revealed the death total in Hiroshima from atomic bombing was 450,000, with 90 per cent of the houses "instantly crushed."
- Sept. 1.** Japanese people told they would vote in general election Jan. 12-31 in accordance with the Potsdam Declaration.
- Sept. 2.** Formal Japanese surrender aboard the battleship *Missouri* in Tokyo Bay.
- Stalin announced Russia would regain southern Sakhalin and Kurile Islands.
- Sept. 4.** British naval force took control of Singapore.
- British Health Ministry stated birth rate for 1944 highest for 20 years, death rate lower than 1938 and infant mortality lowest on record.
- Sept. 4.** Three New Zealand Federations—Farmers, Employers, and Manufacturers—and Association of Chambers of Commerce formed united front to fight trend to "National Socialization."
- Sept. 5.** As of Sept. 16, all major restrictions on railroad passenger travel, except ban on short haul sleeper service, were discontinued.
- W.P.B. reported American industrial capacity had more than doubled during War, and profits increased 120 per cent despite heavy taxes.
- Sept. 6.** OPA announced approaching end of most rationing but said price and rent controls must stay as long as inflation threatened.
- Canada announced she would adopt national flag and her people would be Canadian citizens under British Crown.
- Japanese labor unions, outlawed for 14 years, began re-organization.
- White-collar workers of Westinghouse Electric in six states voted to strike unless granted incentive pay bonus like day workers.
- Sept. 7.** Japanese Admiral revealed attack on Pearl Harbor launched from four carriers 200-250 miles from Oahu.

Memorable Dates of 1945—Continued

- Sept. 8.** Plans reported for \$2,500,000 of public works for next 12 months. States, counties and cities planned \$1,000,000,000.
- Sept. 9.** China accepted surrender of Japanese forces.
- Sept. 10.** Vikund Quisling of Norway sentenced to death for military treason, high treason, theft, embezzlement, and murder.
The war cost Britain 240,000 lives in armed forces, 31,000 in the merchant navy, 60,000 civilians; \$4,800,000,000 in damage on land, and \$920,000,000 at sea.
- Sept. 11.** First 40 war criminals of Pacific war arrested; Former Premier Tojo tried to commit suicide by shooting.
- Sept. 12.** Japan formally surrendered her huge southern armies to Mountbatten in Singapore.
- Sept. 13.** *Pravda* demanded compensation for damage done the Soviet Union by the German invasion, which it estimated at 679 billion rubles.
- Sept. 14.** Imperial economic isolation opposed by Australia and New Zealand.
Joint Congressional Committee appointed to investigate Pearl Harbor.
U.A.W. demanded 30 per cent wage increase for all automobile workers.
- Sept. 15.** Council of Foreign Ministers agreed to place Italian colonies under UNO trusteeship.
- Sept. 16.** World crop of wheat for 1945 stated as 5 per cent below 1944, 8 per cent below 1935-39 average.
- Sept. 17.** President Truman stated U.S. prepared to fill major relief needs of Europe, but cannot keep Europe above a minimum level of subsistence.
- Sept. 18.** French labor circles estimated 1,500,000 German and Italian prisoners of war would be working for France before the year's end.
Major Powers agreed Korea be a free and independent nation, Koreans advised to be patient and cooperative.
- Sept. 21.** Claims for unemployment compensation reached 1,479,606.
- Sept. 23.** Egyptian Cabinet demanded withdrawal of British troops, and incorporation of the Anglo-Egyptian Sudan into Egypt.
- Sept. 25.** The Annamites, opposing return of French rule and seeking independence, staged a violent uprising in Indochina.
- Sept. 27.** Emperor Hirohito made an unprecedented visit to General MacArthur in Tokyo.
- Oct. 4.** President Truman ordered seizure of 26 oil producing and refining companies. Also replaced WPB with a civilian Production Administration.
- Oct. 5.** After adjournment of deadlocked foreign ministers' meeting, Secretary Byrnes declared "peace cannot be the exclusive concern of a few presently powerful States."
- Oct. 9.** Gen. George O. Marshall, Chief of Staff, in his biennial report, advocated universal military training for the U.S. to an extent that an army of 4 million could be mobilized within a year.
During the last five years the U.S. doubled its industrial output and produced \$186 billions worth of weapons and supplies, announced J. A. Krug, chairman of the War Production Board.
- Oct. 10.** The Office of Military Government announced that more than 75 per cent of Germany's industry remains intact.
- Oct. 11.** MacArthur ordered the Japanese government under Premier Shidehara to institute the following reforms: the vote for women, encouragement of labor unions, liberalization of education, abolition of oppressive supervision of thoughts and actions, democratization of industries.
- Oct. 12.** Eisenhower deprived all Nazis of a vote in Germany. Entire holdings of I. C. Farbenindustrie, valued at \$2 billions was seized by the Allies.
- Oct. 13.** Four hundred scientists who developed atomic bomb asserted that an effort to keep atomic knowledge from the rest of the world "will lead to a war more savage than the last."
- Oct. 14.** The Indonesian People's Army declared war against the Netherlands.
- Oct. 18.** Allies charged 24 German war leaders with plotting against the peace and with atrocities in war.
- Oct. 19.** President Angarita of Venezuela was overthrown by full-scale revolution.
- Oct. 20.** U.S. and Belgium settled lend-lease relations with U.S. agreeing to repay in various ways the \$90 millions of reverse Lend-Lease surplus. Belgium was the only country that supplied U.S. with more aid than it received.
- Netherlands given \$50,000,000 credit loan by Export-Import Bank.
- Oct. 21.** Dr. Romulo Betancourt, socialist revolutionary, assumed control of Venezuela.
- Oct. 22.** British Admiralty announced Royal Navy losses of 730 ships and 49,305 men during war.
- Oct. 24.** Secretary Byrnes signed United Nations Charter. Russia demanded that Finland pay \$79,000,000 in reparations during 1946.
President Beneš of Czechoslovakia nationalized key industries.
Final returns in France's election revealed Communists won 152 seats; Socialists, 141 and Mouvement Republicain Populaire, 138.
MacArthur ordered establishment of free and independent press in Japan.
- Oct. 25.** Dr. Robert Ley, Chief of the German Labor Front, committed suicide.
- Oct. 29.** The trial of General Yamashita, Japanese commander of the Philippines, opened at Manila.
General Marshall claimed demobilization has grown into disintegration, not only of the armed forces, but of all conception of world responsibility.
- Oct. 30.** Prime Minister Attlee announced he would visit President Truman on Nov. 11 to discuss atomic bomb. President Vargas of Brazil resigned.
- Oct. 31.** Russia demanded \$300,000,000 reparations from Italy for herself and Balkan states.
- Nov. 1.** British Labor government said that Civil Aviation and Cable and Wireless, Ltd., would be state-owned.
Terrorists in Palestine crippled railroad traffic.
- Nov. 2.** U.S. recognized Hungarian provisional government.
Riots provoked by Palestine issue flared in Egypt.
- Nov. 6.** Molotov asserted atomic bomb cannot be kept secret and promised Russians atomic energy.
De Gaulle resigned from Constituent Assembly.
- Nov. 7.** British jet plane made new speed record of 606 m.p.h.
- Nov. 12.** Cordell Hull awarded 1945 Nobel Peace Prize.
- Nov. 13.** De Gaulle selected as President of the French Provisional Government.
- Nov. 14.** U.S. Senate committee accused Swiss government and Swiss banks of aiding Nazis.
- Nov. 15.** Joint Congressional Committee opened investigation of Pearl Harbor attack.
- Nov. 16.** Food riots broke out in Japan.
- Nov. 20.** President Truman appointed Gen. Eisenhower Army Chief of Staff and Admiral Nimitz Chief of Naval Operations.
- Nov. 21.** Justice Robert H. Jackson opened Nuremberg trial against Nazi war criminals.
United Automobile Workers, CIO, went on strike.
- Nov. 23.** Rationing of meat, butter, and all other red point foods ended.
- Nov. 24.** Preparatory Commission of UNO opened its meeting in London.
Ferruccio Parri resigned as Premier of Italy.
- Nov. 25.** Changking reported Russia demanded economic participation in Manchuria.
- Nov. 27.** Gen. Hurley resigned as Ambassador to China, charging the State Dept. was preventing him from carrying out American policy. The President at once appointed Gen. Marshall in his place.
- Nov. 29.** British took Surabaya in Indonesia.
Yugoslavia declared a republic by Constituent Assembly.
- Dec. 8.** Navy doctors stated that tests of sulfa drugs in a Calcutta cholera outbreak may have developed a complete cure for this dread disease.
Admiral King declared, "Japan lost the war because she lost command of the sea."
- Dec. 10.** Authoritative opinions gathered by N.A.M. agreed that the first constructive uses of atomic energy will be in medicine, biology, chemistry and physics.
The Dow-Jones index of industrial stocks reached the 1945 high at 196.59, with a year's sale of 390 million shares.
President Truman appointed three Americans to represent the U.S. at the first U.N.O. meeting, Jan. 12.
- Dec. 18.** First total eclipse of moon since 1942.
UNO Preparatory Commission decided to have the organization's permanent home in the U.S.
- Dec. 27.** The Pope appointed Archbishop Francis J. Spellman and three other Americans Cardinals.

WHAT WAS REALLY THE MOST IMPORTANT EVENT OF 1945?

As an aid to perspective in considering the past momentous and bewildering year, we asked a small group of scientific and professional folk the above question: What happening was truly most significant? Each was to express a personal judgment. We asked each to speak, not as physicist, educator, financier or journalist only, but as a mature American and citizen of the world with special experience.

Here is what they say.

Dr. Robert A. Millikan
Famous physicist,
Author, and Nobel
Prize winner.

"The success of the physicist, chemists and engineers in utilizing the energy of uranium fission for producing an explosive many thousand times more destructive than any in the past.

"What the bomb has done is to give a demonstration which sinks into the consciousness of all races and conditions of men that man must eliminate global wars now."

Bernard M. Baruch
Elder Statesman
and Government
adviser, Author,
Financier.

"To my mind the most important happening was the constant trend away from control by the individual to control by the Government. This was horribly exemplified in the Nazi and Fascist movements in Germany, Italy and Japan.

"There is also a trend in all governments in the United Nations Organization toward domination over the individual, making the State the master instead of the servant it should be.

"If this trend continues to the extreme it will leave no freedom of any kind, and no dignity of man."

Virginia C. Gildersleeve
Dean of Barnard,
Member of Commis-
sion to Study the Or-
ganization of Peace.

"I consider the most important happening the unanimous adoption at San Francisco of the Charter of the United Nations.

"As I was myself present at this great event, I am especially conscious of its significance, but I believe that in future years history will agree with my estimate, and consider that at this great meeting a new era opened."

John Temple Graves
Editor, Author,
Lecturer

"In any other year something not in the big headlines, intangible, might be the most genuinely important happening. But not in a year which has seen atomic power released. To think of any event as more important than that is to be dangerously without the imagination and sense of proportion for which these atomic times are calling."

WHEN THE SUN BECAME A CRESCENT

The 85 percent eclipsed sun as it rose over the Continental Divide of the Rocky Mountains, east of Butte, Montana, July 9, 1945. (Photo by Peter A. Leavens and George V. Plachy, New York City Amateur Astronomers Expedition.)

THE NEW INTERNATIONAL YEAR BOOK 1945

ACADEMY OF ARTS, Royal. The Royal Academy of Arts, founded by King George III in 1768, is maintained, through the public support of its exhibitions, for the promotion of the Fine Arts. The Membership consists of forty Academicians and thirty Associates, elected by ballot by the Members from among the most distinguished painters, sculptors, architects, and engravers practising in England.

During January and February, 1945, the Royal Academy lent its Galleries for Exhibitions of the British Theatre (British Drama League), Soviet Graphic Art, and the New English Art Club. From May 5 to August 12 it held its Summer Exhibition (the 177th) as usual. For various periods in October, November and December the Galleries were lent for Exhibitions of National War Pictures, the London Group, the Royal Institute of Painters in Water Colours, the Royal Society of Portrait Painters and the National Society.

The Officers of the Royal Academy for 1945 were as follows: President and Trustee, Sir Alfred J. Munnings, P.R.A.; Keeper, Sir Gerald F. Kelley, R.A.; Treasurer and Trustee, E. V. Harris, O.B.E., R.A.; Trustees, Sir William Reid Dick, K.C.V.O., R.A., and W. Russell Flint, R.A.; Secretary, Sir Walter R. M. Lamb, K.C.V.O.

ACADEMY OF ARTS AND LETTERS, American. A society founded in 1904 by members of the National Institute of Arts and Letters. Membership is limited to 50, vacancies being filled by elections from the membership of the Institute.

On May 18, 1945, a Special Meeting of the Academy was held, followed by a Public Ceremony given jointly with the National Institute of Arts and Letters at which new members of the Academy and Institute were inducted, fifteen \$1,000 "Arts and Letters" Grants given, and medals of both institutions awarded. An exhibition of sculpture by Paul Manship, works by newly elected members of both organizations, and Grantees in Art, was opened on the same day in the Art Gallery, and continued through June 29. On November 2 the Annual Meeting of the Academy was held at the Academy building. An Exhibition in the Art Gallery of paintings, drawings, and water-colors by contemporary American Artists purchased by the Academy for presentation to Museums in the U. S. and Canada, and a comprehensive exhibition including the more recent works by Paul Manship was opened and continued through Dec. 31, 1945. This was free to the public.

The membership as of November, 1945, consisted of the following in the order of their election: Bliss Perry, Nicholas Murray Butler, Archer

Milton Huntington, Newton Booth Tarkington, Royal Cortissoz, Wilbur L. Cross, Hermon A. MacNeil, James Earle Fraser, Robert Frost, James Truslow Adams, Adolph Alexander Weinman, Walter Damrosch, Anna Hyatt Huntington, Paul Manship, Eugene O'Neill, Henry Dwight Sedgwick, Walter Lippmann, M. A. De Wolfe Howe, Frank Jewett Mather, Jr., Stewart Edward White, Deems Taylor, Van Wyck Brooks, Herbert Putnam, William Adams Delano, Charles Warren, Bernard Berson, Chauncey Brewster Tinker, Albert Spalding, Sinclair Lewis, Willa Cather, Ellen Glasgow, Thornton Wilder, Edna St. Vincent Millay, Carl Sandburg, Agnes Repplier, Charles Hopkinson, Eugene Speicher, Henry R. Shepley, John Alden Carpenter, John Sloan, Barry Faulkner, Edward W. Redfield, Gifford Beal, Frederick Law Olmsted, Ernest Bloch, John Marin, Edward McCartan, Douglas Southall Freeman, Robinson Jeffers, and Lee Lawrie.

Officers elected in 1945 were: President, Walter Damrosch; Chancellor and Treasurer, James Truslow Adams; Secretary, Van Wyck Brooks; Directors: William Adams Delano, Barry Faulkner, Paul Manship, Eugene Speicher, Deems Taylor, and Chauncey Brewster Tinker. Administrative offices are at 633 West 155 St., New York City.

ACADEMY OF DESIGN, National. An organization of American artists, founded in New York in 1825 by Samuel Morse and incorporated in 1828 for the purpose of "cultivation and extension of the arts of design." In 1906 the Society of American Artists merged with the Academy.

The Academy maintains annual Exhibitions of painting, sculpture, and graphic arts, to which all artists may contribute, subject to jury. At these exhibitions various prizes are awarded. It conducts an Art School at which no tuition is charged. It also administers the Henry W. Ranger Fund for the purchase of paintings to be presented to various museums. Its membership is limited to professional painters, sculptors, workers in the graphic arts, and architects.

The Associates elected at the annual meeting in December, 1945, were: *Sculptor*—Mitchell Field; *Architect*—Charles Downing Lay; *Workers in the Graphic Arts*—Stephen Csoka, Norman Kent, Clare Leighton, Leo Meissner, and Lynd Ward; *Aquarellists*—Peter Helck, Julius Delbos and Donald Teague.

Elected Officers are: President, Hobart Nichols; Vice-President, John Taylor Arms; Second Vice-President, Paul Manship; Corresponding Secretary, Georg Lober; Recording Secretary, Raymond P. R. Neilson; Assistant Corresponding Secretary, Wal-

ter Farndon; Treasurer, F. Ballard Williams; Assistant Treasurer, Charles Keck. The Galleries and Executive Offices are located at 1083 Fifth Avenue, New York.

ACADEMY OF SCIENCES, National. The National Academy of Sciences originated from the need of the Government for technical scientific advice in connection with the Civil War. Its charter, passed by Congress and approved by President Lincoln in 1863, provides that it "shall, whenever called upon by any department of the Government, investigate, examine, experiment, and report upon any subject of science or art, the actual expense of such investigations . . . to be paid from appropriations which may be made for the purpose, but the Academy shall receive no compensation whatever for any services to the Government of the United States."

The membership of the Academy is limited to 450 citizens of the United States and 50 foreign associates. There are no applications for membership. Nominations are presented by the sections representing different sciences.

In order to permit the organization of the nation's scientific resources on a more inclusive scale than was possible within the membership of the Academy itself, the National Research Council was organized by the National Academy of Sciences at the request of President Wilson in the spring of 1916, and was established on a permanent basis on May 11, 1918, by Presidential Executive Order, "to promote research in the mathematical, physical, and biological sciences, and in the application of these sciences to engineering, agriculture, medicine, and other useful arts, with the object of increasing knowledge, of strengthening the national defense, and of contributing in other ways to the public welfare."

The membership of the Council is composed largely of appointed representatives of approximately eighty-five of the major scientific and technical societies of the country, together with representatives of certain other research organizations, representatives of Government scientific bureaus, and a limited number of members at large. These members are appointed by the President of the National Academy of Sciences. Serving on Committees of the Council are approximately 1,800 outstanding scientists.

The Academy-Research Council does not maintain scientific laboratories but functions through sponsorship of conferences, technical committees, surveys, scientific publications, and administration of funds for research projects and fellowships.

The administrative costs of the Academy and Council are charged against the income of a permanent endowment given, together with the building, by the Carnegie Corporation. Financial support of scientific projects is obtained from contracts with governmental and private agencies and from special grants from foundations, societies, and individuals.

Many highly confidential projects contributing directly to the war effort were financed through contracts with the Office of Scientific Research and Development, War Production Board, War and Navy Departments, and other Federal agencies, as well as by grants from various sources.

The Academy issues the *Proceedings*, *Scientific Memoirs* and *Biographical Memoirs*. An Annual Report is made to Congress and published.

The Council issues a series of *Bulletins*, *Reprints*, and *Circulars*. A list of publications, with prices, is available upon request.

Academy officers: Frank B. Jewett, President; Luther P. Eisenhart, Vice President; Detlev W. Bronk, Foreign Secretary; F. E. Wright, Home Secretary; J. C. Hunsaker, Treasurer; George B. Darling, Executive Secretary.

Council officers: Ross G. Harrison, Chairman; George B. Darling, Executive Secretary.

The building of the National Academy of Sciences and the National Research Council is located at 2101 Constitution Avenue, Washington, D. C.

ACCIDENTS. Accidental deaths in 1945 totalled approximately 96,000, an increase of less than 1,000, or 1 per cent, from the 1944 total of 95,237, according to National Safety Council estimates. Non-fatal injuries, also, are estimated to have increased 1 per cent from 10,200,000 to 10,300,000.

Direct costs—including wage loss, medical expense, overhead costs of insurance, and property damage in motor vehicle accidents and in fires—were approximately \$3,900,000,000 in 1945. Indirect costs of occupational accidents—such as interference with production, damaged materials and machinery, time lost by workers other than the injured—amounted to about \$1,300,000,000, which carried total costs in 1945 up to about \$5,200,000,000.

The following table shows the 1945 and 1944 death totals for the principal classes of accidents, together with the change in each class:

	1945	1944	Change
Total	96,000	95,237	+1%
Motor vehicle	28,500	24,282	+17%
Public non-motor-vehicle—			
Civilian	15,500	15,000	+3%
Home—civilian	33,500	33,000	+2%
Occupational—civilian	16,000	16,000	0
Military personnel	6,500	11,500	-43%

Motor vehicle deaths include some which also are shown as occupational, military personnel, and home. This duplication amounted to about 4,000 in 1945 and 4,500 in 1944. The 1944 all-accident and motor vehicle totals are U. S. Census Bureau figures. All others are National Safety Council estimates.

The 1945 death rate per 100,000 population was 71.6. Only five years since 1900 had lower rates—and the lowest was 68.4, in 1921.

Heart disease, cancer, cerebral hemorrhage and nephritis were the only causes of death exceeding accidents in 1943. Preliminary information indicates that accidents ranked fifth again in 1945. Among males alone, accidents are the third most important cause of death, being exceeded only by heart disease and cancer. From age 2 to 28, both sexes, accidents caused more deaths than any disease in 1943. Among males alone they were first from age 2 to 38.

The 1945 accidental deaths were distributed by age about as follows: 0-4 years, 7,850; 5-14 years, 6,850; 15-24 years, 12,600; 25-44 years, 19,400; 45-64 years, 20,300; 65 years and older, 29,000. Probably more significant are the death rates per 100,000 population: 0-4 years, 62; 5-14 years, 31; 15-24 years, 59; 25-44 years, 50; 45-64 years, 73; 65 years and older, 290. The rate for 5-14 years is only one-ninth of the 65 and older rate. In most recent years the rate for elderly people rose, while that for school children decreased.

There was only one disaster in 1945 that caused more than 50 deaths, compared to 8 such catastrophes in 1944. This one disaster was a tornado in Oklahoma, Missouri and Arkansas. Deaths numbered 119. Another tornado in Alabama and Mississippi killed 33. A collision of two railroad trains resulted in 34 deaths. But nearly all of the 1945

fatality total came from one-or-two-death accidents.

Motor Vehicle Accidents. Deaths from motor vehicle accidents totalled 28,500 in 1945, a 17 per cent increase over 1944. Nearly all of this increase came in the last five months of the year, after gasoline rationing was discontinued. However, the 1945 death total was still 29 per cent below the prewar high of 39,969 in 1941. The death rates per 100,000,000 vehicle miles traveled were: 1941, 12.0; 1944, 11.3; 1945, 11.4.

Provisional reports indicate that rural accident deaths totalled approximately 17,100 in 1945, a 25 per cent increase from 1944. Urban accident fatalities went up about 7 per cent to 11,400. Rural deaths were 34 per cent below 1941, while urban deaths were down only 20 per cent.

Pedestrian deaths numbered approximately 11,200, 14 per cent more than in 1944 but 17 per cent less than in 1941. Non-pedestrian deaths totalled 17,300, up 20 per cent from 1944 but 35 per cent below 1941.

There were increases in deaths in every age group, but the amount of increase varied considerably. For children under 5 years the death total was 1,350, a 12 per cent increase from 1944. Children 5 to 14 years had 2,550 deaths, a rise of 24 per cent—the largest change for any age group. There were 5,250 deaths of persons 15 to 24 years, up 18 per cent. The death total for 25 to 44 years was 7,700, or 17 per cent more than in 1944. Persons 45 to 64 years had 7,000 fatalities, a 14 per cent increase. Among people 65 years and older the death total was 4,650, 21 per cent above 1944.

In addition to the deaths, about 1,000,000 persons received non-fatal injuries in motor vehicle accidents during 1945, or one out of each 134 persons in the U. S. Wage loss, medical expense, and overhead costs of insurance amounted to about \$800,000,000, and property damage to approximately \$650,000,000—a total of \$1,450,000,000.

Other Public Accidents. The 1945 death toll from public non-motor-vehicle accidents was approximately 15,500, an increase of 500 from the 1944 total of 15,000. The largest increases were in drownings, falls and air transport accidents. Firearms accidents and fatal burns, however, decreased.

Children under 5 years had about the same number of deaths as in 1944, while those 5 to 14 years old had 4 per cent fewer deaths. The death total for persons 15 to 24 years went down 8 per cent. Increases of 7 to 12 per cent were recorded in the older age groups.

Injuries numbered approximately 1,950,000. The cost of fatal and non-fatal accidents is estimated at \$400,000,000 for wage loss, medical expense, and overhead costs of insurance.

Home Accidents. There were approximately 33,500 deaths from home accidents, a 2 per cent increase from the 1944 total of 33,000. Injuries numbered about 5,000,000. Wage loss, medical expense, and overhead costs of insurance amounted to \$600,000,000.

Changes in most types of fatal home accidents were small. Poisonings increased 5 per cent and falls 3 per cent; firearms accidents numbered about the same as in 1944, while mechanical suffocation (largely infants smothered by bed clothes) and burns decreased approximately 4 per cent each. Asphyxiations, however, rose about 15 per cent.

Decreases in deaths occurred in the younger age groups: 3 per cent among children under 5 years; 7 per cent in the 5 to 14 year group; and 8 per

cent for persons 15 to 24 years. Increases of 4 to 6 per cent were reported in the older age groups. However, compared with prewar 1941 the death total for children under 5 years showed a considerable increase—18 per cent.

Occupational Accidents. Deaths from occupational accidents numbered approximately 16,000 in 1945, about the same number as occurred in 1944. Employment decreased approximately 2 per cent. Non-fatal injuries numbered about 2,000,000.

Direct costs of occupational accidents—wage loss, medical expense, and overhead costs of insurance—amounted to about \$1,050,000,000. Indirect costs, such as time lost by supervisors and workers other than the injured, interrupted production schedules, and damaged machinery are estimated at \$1,300,000,000, which places total costs for these accidents at \$2,350,000,000.

These figures measure the size of the occupational accident problem, but they do not indicate the full extent to which accidents interfere with production. Off-the-job accidents which keep employees away from work, or lower their efficiency while at work, must be counted as a factor in restricting output. The toll resulting from off-the-job accidents was 28,000 workers killed and 2,500,000 injured. The total loss from accidents to workers, on and off the job, thus was 44,000 deaths and 4,500,000 injuries resulting in lost time beyond the day of the accident.

A. D. BATTEY.

ADMIRALTY ISLANDS. A group of islands (Manus is the largest) in the Australian mandated Territory of New Guinea, of which it forms the Manus district. Total area: 800 square miles. Population (June 30, 1941): 14,234 natives. Capital, Lorengau (on the island of Manus).

ADVANCED STUDY, Institute for. An institution of higher learning founded in 1930 by Mr. Louis Bamberger and Mrs. Felix Fuld. The Institute is different in character from any other American educational institution in that it is planned for students who wish to pursue advanced research beyond the level of the doctor's degree. It has no tuition fee, no routine requirements, no examinations, and awards no degrees. The work is largely individual, though there are seminars and courses of lectures in some subjects. Since the individuals who attend the Institute are in many cases extremely eminent in their subjects, the word "student" is not used, but they are rather designated as "members." The two groups, the faculty and members of the Institute, are in reality a body of scholars working together.

The Institute is supported entirely by endowment. Located at Princeton, N. J., the Institute has no official connection with Princeton University, though there is a great deal of informal cooperation between the two institutions.

During the year 1945 work largely returned to a peacetime basis. The enrollment of temporary members has returned to normal. Two additions have been made to the Faculty of Mathematics, Professor Carl L. Siegel, formerly of the University of Göttingen and Professor Wolfgang Pauli of the Eidgenössische Technische Hochschule in Zürich as Visiting Professor. During the month of December, the award of a Nobel Prize to Professor Pauli was announced for his discovery of the so-called Pauli Exclusion Principle. During the year Professor Benjamin D. Meritt of the School of Humanistic Studies served as Eastman Professor to the University of Oxford. Among the publica-

tions of the Institute during this year was the second volume of Dr. de Tolnay's life of Michelangelo, *Mathematical Cuneiform Texts* edited by Dr. Neugebauer and Dr. Sachs, as well as a large number of articles published in journals of various learned societies.

The Director of the Institute is Dr. Frank Aydelotte and Dr. Abraham Flexner is Director Emeritus. Headquarters are in Fuld Hall, Olden Lane, Princeton, N. J.

ADVENT MOVEMENT. A religious movement which originated in America with William Miller (1782-1849), who believed in the imminent, personal second coming of Christ. There are six Adventist bodies in the United States, the largest being the Seventh-day Adventist Denomination, formally organized in 1860, which observes Saturday as the Sabbath of the Scriptures. Headquarters, Takoma Park, Washington, D.C. For statistics, see RELIGIOUS ORGANIZATIONS.

AEGEAN ISLANDS. The islands in the Aegean Sea near Turkey in Asia; under Italian rule from 1912 to 1944 (see below under *Political Future*). They include the Dodecanese group with Rhodes and Castellorosso. Their area and population together with their Italian names in parentheses are given in the accompanying table.

Island	Sq. mi.	Pop. (1936)
Astropalia (Stampalia).....	44	2,008
Casos (Caso).....	27	1,890
Castellorosso.....	4	2,238
Cos (Coo).....	111	19,781
Kalyzmos (Calino).....	49	15,247
Karohi (Calohi).....	12	1,461
Karpathos (Scarpanto).....	118	7,770
Leros (Lero).....	28	13,657
Lipso (Liso).....	7	977
Nisyros (Nisiro).....	18	3,391
Patmos (Patmo).....	22	3,184
Rhodes (Rodi).....	545	61,886
Symi (Simi).....	25	6,195
Tilos (Piscopi).....	25	1,215
Total.....	1,035	140,848

The total population in 1936 (140,848) comprised 85 percent native, 12 percent Italian, and 3 percent foreign. On Jan. 1, 1940, the total population was 122,000. Chief towns (1936 populations): Rhodes (capital) 27,466, Kalyzmos 15,247, Cos 9,852, Symi 6,195.

Production, etc. The principal agricultural products consist of grapes, olives, tobacco, oranges, and vegetables. Livestock (1938): 62,735 goats, 51,907 sheep, 6,460 horses, mules, and donkeys, 4,710 oxen, 2,656 swine. Sponge fishing, and the manufacture of artistic pottery and tiles, tobacco, wine, olive oil, and oriental carpets are the chief industries. Trade (1938): imports 157,421,000 lire; exports 21,851,000 lire (lira was worth \$0.0526 for 1938). Roads (1940): 391 miles.

Political Future. Under the terms of the armistice granted to Italy by the Allies during September, 1944, Italy officially relinquished her hold over the Dodecanese. German occupation continued until the unconditional surrender of Germany to the Allies which became effective at 6:01 P.M., May 8, 1945, U.S. Eastern War Time. Thereafter the islands were subject to Allied control. Italian Foreign Minister de Gasperi in a letter dated Aug. 22, 1945, to U.S. Secretary of State James F. Byrnes agreed to cede the Dodecanese to Greece.

AERONAUTICS. The termination of hostilities against Germany and Japan in 1945 brought an end to the

mass manufacture of combat aircraft in the United States, although the development of new types, particularly of the jet-propelled planes, was not relaxed. A small portion of the huge wartime industry scattered about the country was thereafter devoted to the manufacture of commercial planes; much of the remainder was reconverted to the manufacture of automobiles, refrigerators, and other products. The operation of peacetime airlines was resumed, and projects for expansion of air facilities were planned by private industry.

Victory-Through-Airpower Policy. The final stages of the defeat of Hitler gave continued emphasis to the victory-through-airpower policy of the United States and her allies. *Festung Europa* was breached and the Japanese islands opened to American occupation by a forceful application and complete coordination of land, sea, and air power. As General of the Army H. H. Arnold, who commanded the American Army Air Forces, remarked, no one service carried the war exclusively to a successful conclusion. Airpower alone cannot win a war. Nevertheless, the time-table of victory in World War II was expedited by the spectacular achievement of the Allied air forces.

Failure of the air forces of any nation to achieve their objective in modern strategy postpones victory or even invites defeat. In December and January of the winter of 1944-1945, the inability of the German *Luftwaffe* to destroy Allied air forces was largely responsible for the loss of the Battle of the Bulge. Field Marshal Goering had 2,500 fighter planes ready to cover the Ardennes offensive of General von Rundstedt. This force, however, failed to protect the Nazi ground troops, which were subject to repeated attacks from the American Air Force. The AAF bombed railheads near the front, destroyed fuel supplies and munitions, and eventually compelled the German retreat.

The complete defeat of the *Luftwaffe* began with a change in the strategy of the AAF in the last stages of the daylight bombing of industrial centers of Germany. In the winter of 1944-1945, the Thunderbolts (P-47) and Mustangs (P-51) escorting AAF bombers were instructed henceforth to divide their attention between protection of the bombers and aggressive attacks on German fighter planes. As a result, Nazi losses mounted to 1,115 in January, to 1,118 in February, and to 1,217 in March.

The continued bombing of German industrial targets crippled the war effort of the Nazi Reich. One million workers alone were used to clear away the wreckage of bombed-out factories; several millions more were constantly employed in reconstruction of factories and equipment. The dispersal of the Junkers aircraft engine factory at Magdeburg to Nordhausen, Hasserode, Lengsfeld, and Ebersbach complicated transportation and slowed down production. The attempt to remove the aviation industry to tunnels and caves brought a measure of safety at the expense of quantity of production. In February, 1945, Germany's transportation system collapsed as a result of air attack. On February 22, more than 10,000 Allied planes, based in England, France, Holland, Belgium, and Italy, struck at 200 targets on the German *Reichsbahn*. Instead of bombing at levels of 25,000 feet, the heavy bombers glided over their targets as low as 5,000 feet. Instead of flying in large formations, the bombers, many of them without fighter escort, broke up into groups and squadrons, and fanned out for the scattered targets. The *Luftwaffe* was unable to readjust itself to this change in tactics. Thus, with a loss of only a few planes, German war

production was cut in half, and traffic was reduced by 90 percent.

Both the AAF and the British Royal Air Force played conspicuous roles in the crossing of the Rhine. On March 24, troops of the First Allied Airborne Army, carried in heavily escorted transport planes and gliders, landed on the right bank of the Rhine. In one day, 14,365 men, 109 tons of ammunition, 582 tons of supplies, 695 vehicles and 113 artillery weapons were set down on the German side of the river. A fanatical attack of the *Luftwaffe*, using ramming tactics against the AAF and RAF bombers, utterly failed. On April 16, three weeks before V-E Day, General Carl A. Spaatz, commanding the U. S. Strategic Air Forces in Europe, announced the end of strategic air war. All that remained was a mopping up task.

In March, 1945, the *Luftwaffe* had resumed the night bombing of England by piloted bombers. The use of the flying bomb had persisted throughout the winter of 1944-1945 and continued until a month preceding V-E Day. But the *Vergeltungswaffe-1* (Vengeance Weapon), which had proved a dangerous menace to London in 1944, had now been largely mastered by speedy RAF and AAF fighter planes. (See AERONAUTICS in the YEAR BOOK for 1944.) Lack of territory bordering the English Channel in 1945 prevented the Nazi *Oberkommando der Wehrmacht* from continuance of an effective attack of British towns by flying bombs. Occasional attacks by the V-2 rocket bomb, which traversed the stratosphere and travelled faster than sound, were launched from considerable distances. Giant V-2 bombs scored numerous hits on London. Due to the retreat of the *Wehrmacht* from the coast of the English Channel, the greater range made the bombs less effective, and their use was discontinued in March. Beginning with the first attack on June 15, 1944, the V-1 and the V-2 had killed 8,436 persons in England and injured over 25,000. If introduced at an earlier stage of the war, these weapons might have turned the scales in favor of Hitler. Even so, Nazi V-1 bombs, directed against Antwerp in the winter of 1944-1945, greatly crippled the port facilities upon which the Allies depended for sending supplies to the Western Front.

After V-E Day, a considerable portion of the AAF and the RAF was left in the American and British zones of occupation in Germany. A large part was redeployed to the United States or sent direct to the Pacific area. In the meantime, the U. S. Strategic Bombing Survey began a comprehensive study of the effect of the Allied bomber offensive on Germany. The European war cost the AAF 79,265 casualties, including killed, wounded, missing, and captured men. The RAF lost 79,281 men. The Allies flew 1,440,000 bomber sorties and 2,680,000 fighter sorties, and dropped almost 2,700,000 tons of bombs. In 1945, the number of combat planes reached a peak of 28,000 planes, and a maximum of 1,300,000 men in combat commands. In March, 1945, the number of sorties per day set an all-time record. On June 7, 1944, during the invasion of Normandy, over 11,000 Allied planes had flown over the French coast. On March 24, 1945, over 12,000 Allied planes struck at Germany in the Rhine-Muenster area. In combat missions, the AAF lost 18,418 aircraft, and the RAF lost over 22,000 planes; while the enemy lost 32,921. Over 284,000 airborne troops were transported by the Ninth Troop Carrier Command, which also evacuated over 210,000 casualties of all services.

Air Warfare in the Pacific. Air power played an equally significant role in the Battle of the Pacific.

The B-17 (Flying Fortress) had been the principal bomber of the AAF in the European theater. The enormous distances in the Pacific, however, required a bomber with a greater range than the B-17. As a result, the celebrated B-29 (Superfortress) was developed for the assault on Japan. In October, 1943, Admiral Nimitz warned that the amphibious drive to capture island bases required for the assault on Japan would soon result in air raids on Nippon comparable to the bombardment of Nazi Germany. In June, 1944, using air bases in China, the Twentieth Bomber Command launched the first strategic attack on Japan. By November, Tokyo began to be bombed by Superfortresses based on the captured island of Saipan. The relentless retaliation upon the land of Shinto was now under way. In 1944, not more than 100 bombers attacked Japan in a single operation. But by August, 1945, over 800 Superfortresses attacked in a single night-raid. The average bomb load of 2.6 tons of explosives in November, 1944, had increased to 7.4 tons in July, 1945. During 1944-1945, the Twenty-First Bomber Command, based on the Marianas Islands, flew 90 million miles to and from the Japanese main islands with an accident loss of slightly less than one aircraft for every one million miles of flight. The percentage of aircraft lost on bombing missions dropped from a high of 5.7 percent in January, 1945, to 0.4 percent in July.

The desperate battle for Okinawa by sea and by air was waged for the purpose of establishing land bases for the final aerial assault on Japan and on Japanese shipping between Japan and Southeast Asia. It had been expected that by November, 1945, when the invasion of Kyushu was scheduled, there would be 47 groups of Army, Navy and Marine planes based on Okinawa and Ie Shima. Ultimately, Lieutenant General James Doolittle's Eighth Air Force was to include twenty groups of Superfortresses.

The contemplated amphibious assault on Kyushu never occurred. Japan sued for peace on August 10, four days after the atomic bomb struck Hiroshima, and two days after the Russian declaration of war. But it was neither the atomic bomb nor the Russian invasion of Manchuria that precipitated the defeat of Japan. The bombardment of the four main islands had been so systematic that the war effort of Nippon was almost paralyzed. In March, Major General Le May began a new method of attack, namely, bombardment with incendiaries (M-69 fire bombs) at a low level. Previously, Superfortresses bombed Japanese targets from altitudes of 24,000 or more feet. On March 9, Tokyo was attacked by 279 Superfortresses at an average altitude of only 7,050 feet. The Japanese defenders were confused, with the result that only 14 B-29s were lost. Nearly sixteen square miles of the industrial district of Tokyo was burned in the most destructive air raid of the entire war prior to the blast of the atomic bomb at Hiroshima. In a series of incendiary attacks, over 100,000 tons of bombs were dropped on Japan. In 66 cities, over 169 square miles of urban districts were burned out. The two atomic bombs, exploded over Hiroshima on August 6 and Nagasaki on August 9, completely destroyed large sections of these cities. The attacks on the 68 cities, with incendiaries and atomic bombs, resulted in the destruction of 42 percent of the urban industrial areas of Japan. The 68 devastated cities had a total population of 21 millions.

In the meanwhile, the Fourteenth Air Force under Major-General Claire L. Chennault, blasted

Japanese communications throughout China and was partly responsible for the Japanese decision in May, 1945, to give up their Greater East Asia corridor. The re-conquest of Burma and of Borneo was made possible through air attacks. After the surrender of Japan, Premier Prince Hagashi-Kuni declared that by June, 1945, when all of the major cities of Japan had been partly destroyed by incendiaries, the ability of Japan to carry on war had been disastrously undermined. In the entire Battle of the Pacific, the AAF flew over 600,000 sorties, lost 4,200 planes in combat, dropped 550,000 tons of explosives, destroyed 10,500 enemy planes, and suffered 25,000 casualties.

During the American attack on Okinawa (March-June, 1945), Japanese air forces resorted to desperate tactics that took a heavy toll of American naval vessels. In the summer of 1944, the Japanese Government had begun the recruitment of *Tokubetsu Kogeketai* or Special Attack Forces. After a rigorous training, Japanese pilots in these forces were prepared to fly their planes, heavily loaded with explosives, against warships of the enemy. The Special Attack Forces in the navy, bearing the name *Kamikaze* (Divine Wind), were truly suicide planes. The pilots carried no parachutes, and seldom escaped destruction when their planes collided with their targets. Another suicide weapon was the *Baka*, a man-driven, rocket-propelled flying bomb, borne to within a few miles of its target, and then released by its mother-plane, a medium bomber. The *Kamikaze* were used against American vessels in the Japanese defense of Leyte. The all-out attack by *Kamikaze*, however, was made in the battle for Okinawa. Here suicide planes proved a serious menace to the American navy. They crippled numerous vessels, and were chiefly responsible for the 9,731 naval casualties in the attack on Okinawa. Casualties on the *Bunker Hill* alone amounted to 656, on the *Ticonderoga* to 337, and on the *Nashville* to 323. The alertness of American carrier planes and the superior anti-aircraft gunnery on American vessels eventually triumphed over the fanatical attacks of the *Kamikaze*.

American Aircraft Production. The stupendous victories of the American Air Force could never have been accomplished without the extraordinary production of American aircraft. In 1945, which saw V-E Day on May 8 and V-J Day on September 2, American factories built nearly 50,000 planes with a total air-frame weight of nearly 700,000,000 pounds. The falling-off in production was the natural consequence of the end of hostilities. Beginning with 1939 there had been rapidly increasing

AMERICAN AIRPLANE INDUSTRY

Year	Number of Planes Built	Weight of Air- frames (lb)
1939	6,315	6,600,000
1940	12,248	20,700,000
1941	19,500	83,500,000
1942	47,836	275,949,000
1943	85,898	654,616,000
1944	96,359	952,441,000
1945 (Jan.-Sept.)	46,003	520,994,000

production until the year that victory was achieved. The greater increase came in the total weight of the air-frames as compared with the number of planes which came into mass production year after year marked the tendency toward the construction of heavier planes. Throughout the first half of the year 1945, the United States continued to supply her Allies with aircraft and aeronautical equipment under Lend-Lease agreements.

By July 1, 1945, this country had given the U.S.S.R. a total of 14,450 planes and 47,700,000 square feet of aircraft landing mats. Since the beginning of the war in 1939, Great Britain had manufactured 125,000 planes, while American lend-lease to the United Kingdom included a total of 10,000 medium bombers and fighters. Large assignments of American aircraft had also reached India and China. Production during the war had gone far beyond postwar needs. At the same time, there was a high rate of obsolescence. By September, 1945, nine out of every ten planes manufactured since the beginning of the war had become obsolescent; and there were 35,821 government-owned planes designated as surplus, representing a total cost of production of two billion dollars. Of these planes, only 8,079 found a ready sale; they brought only 19 percent of their cost of production.

The report of the Reconstruction Finance Corporation in 1945 showed that the total investment in aircraft plants during the war was \$3,448,000,000, of which 91 percent came from government contributions. Only a fraction of this amount could be recovered by the Government through the sale of surplus plants and equipment. Of about 100 aeronautical plants to be sold, by October, 1945, only six had been transferred, and only one was purchased by an aeronautical producer. As the airplane industry began to shrink back toward its prewar size, U.S. Navy plans called for a constant force of 12,000 aircraft, while Army plans called for a force of 7,500 to 12,000. These figures were much higher than the Navy and Army air forces before the war. Some aviation companies had military backlogs for hundreds of combat craft extending well into the year 1947, as well as new orders for passenger and transport planes from the airlines. But even so, the postwar aeronautical manufacture was expected to be barely a tenth of the war industry.

German and Japanese Aircraft Production. Defects in German aircraft production were partly responsible for the collapse of the *Luftwaffe*. Until the last year of the war, Allies had deemed the Nazi *Luftwaffe* as a paragon of efficient personnel and superior material. The lack of adequate performance during the Allied invasion of Normandy began to dispel this myth. Nazi Germany had begun the war in 1939 with a superiority in airpower which won phenomenal successes against small opposition. As a result, the *Luftwaffe* was tempted to postpone improvements in planes as well as tactics. When Dr. Albert Speer, Reichsminister for Armaments and War Production, took over the aviation industry in 1944, he reduced the 50 types of fighters to 38. The systematic bombardment of aviation factories by the AAF and the RAF had already begun to force changes in the construction of aircraft that produced inferior planes. For instance, the destruction of ball-bearing works caused the Daimler Benz 603 engine to be modified for sleeve bearings, making it a far less reliable motor.

COMPARISON OF AIR FORCES IN 1945 NUMBER OF COMBAT AND MILITARY TRANSPORT PLANES

United Nations		Axis Powers	
United States	68,000	Germany	24,000
Great Britain	31,000		
Soviet Russia	19,000	Japan	19,000
China	1,400		
France	800		
Total	120,200	Total	43,000

Plans for German production were continually upset by fanatical members of the Nazi Party. A project of General Galland for building 5,000 fighter planes a month in order to combat Allied bombers and to regain control of the air was opposed by Marshal Goering, who thought that despite lack of fuel Germany should have a powerful fleet of bombers for retaliation upon England. With the development of the ME-262 jet-propelled plane, the *Luftwaffe* acquired a fighter plane that was capable of annihilating the Allied bomber fleets. And yet, in unrealistic fashion, *Der Fuehrer* limited the new plane to bombing functions. As a bomber, the ME-262 accomplished little; it carried no more than a 500-kilogram bomb. Too late, in October, 1944, Hitler relented and Nazi airmen were allowed to use the ME-262 as a fighter plane. But the Germans never had these jet-propelled planes in sufficient numbers to threaten seriously American and British air power.

Japanese production of aircraft in 1945 suffered from bombardment as severely as did German production. Assaults of the American B-29s were concentrated upon such targets as the Musashina aircraft engine plant outside Tokyo, the Mitsubishi assembly plant at Nagoya, and the ball-bearing works at Kurvana. Among other set-backs, by August, 1945, the two plants that built 70 percent of the propellers for Japan's combat aircraft had been demolished.

The appalling loss of Japanese planes in combat emphasized the need for increased production of aircraft. As a result, the Koiso Cabinet, in February, 1945, proposed the nationalization of the aeronautical industry. For this purpose, a *Gunju Kosho* or Munitions Arsenal, in the Munitions Ministry, was created. But, while state control over the production of aircraft was tightened, the industry remained in private hands. Patriotic campaigns were launched among industrial laborers to increase production. Soldiers were assigned to airplane plants in order to serve as models for factory workers, spurring the workers to higher degrees of efficiency. As the American bombing increased, efforts were made to remove airplane factories underground. The scarcity of metals led to the creation of a Wooden Aircraft Production Bureau in the Munitions Ministry. By improvements in plywood, Japanese manufacturers claimed to have produced planes with wooden frames superior to the celebrated British *Mosquitoes*.

Types of American Military Aircraft. The American Air Forces acquired several new types of combat aircraft and continued the use of most of the types employed in 1944. During the year 1945 the following types of combat planes were produced. (For earlier types of warplanes, see *Aeronautics* in the *YEAR BOOKS* for 1942, 1943, and 1944).

Fighters

Curtiss P-40N (Warhawk). The basic P-40 was designed before World War II and was one of the few American fighter planes in quantity production prior to the Japanese attack on Pearl Harbor. It has since then gone through numerous type changes. Retaining the major structural features of the earlier models, the P-40N is the result of successive modifications to keep pace with military requirements. An improved Allison V-1710 liquid-cooled engine and enlarged rear vision fuselage cut-out, slightly smaller landing gear wheels and provisions for carrying auxiliary wing tanks or additional bombs are a few of the important changes. These new features, added to the rugged construction and high maneuverable qualities of the former P-40 series, make the new P-40N a versatile fighter-bomber for both offensive and defensive operation. The P-40N is a single seat, low-wing monoplane. Wings, stabilizers and vertical fin are of full cantilever design. The semi-monocoque fuselage is constructed of aluminum alloy with Alclad skin, flush riveted. Its Allison engine drives a Curtiss three-blade electrically con-

trolled multiposition constant speed propeller. Armed with six .50-inch caliber machine guns, the P-40N is also equipped with racks for carrying several bombs. It can carry a tube jettisonable launcher under each wing for 4.5 inch aircraft rockets. This latest model Warhawk has a speed which approaches 400 miles per hour. Its service ceiling is over 30,000 feet, and its range is approximately 1,000 miles. Various types of the Curtiss P-40 performed admirably in every theater of the war and ran up high box scores in China, Kiska, New Guinea, Egypt, Tunisia, France, and Germany.

Bell P-63 (Kingcobra). A heavier and more powerful version of the Bell P-39, Airacobra partly replaced the P-39 in production in 1944. The combat radius of the Bell P-63 is fifty percent greater than that of the P-39, which means that it can engage in aerial combat that much deeper in enemy territory. The P-63 has a service ceiling of 35,000 feet and a speed of nearly 400 miles an hour, compared with the 30,000 feet ceiling and 375 miles-an-hour speed of the P-39. The principal changes in the new airplane are in the power plant and low drag laminar flow wing. The new liquid-cooled V-1720 twelve-cylinder Allison engine of 1,500 horsepower with 2-stage gives higher compression through the use of a fuel supercharger geared at one speed for medium altitudes and at a higher speed for high altitude flying. In addition, it has a rating of 800 more horsepower than the Allison engine in the P-39. The wingspread of the P-63 is four feet greater than the 34 feet of the P-39. The laminar flow wing section is designed to produce minimum drag on all surfaces of the wing and thereby increase the speed of the airplane. The new P-63 was developed as the result of integration of combat performance reports on the P-39 with intense experimentation by the AAF Material Command laboratories at Wright Field in Dayton, Ohio, in conjunction with the Bell Aircraft Company at Buffalo, New York. The armament of the P-63 and the P-39 is substantially the same. Both are equipped with a .37-millimeter cannon firing through the propeller hub and four .50-inch caliber machine guns, two installed in the wings and two in the nose firing through the propeller arc. The armor includes leak-proof tanks and bullet-proof glass. The P-63, like its predecessor, has been an effective fighter in both the Pacific and European areas.

North American P-51 (Mustang). A single-seat and single-engine fighter, the original Mustang, designed and built for British use, was intended for low and medium altitude. While most aeronautical engineers in 1939 believed it impossible to design an airplane capable of accomplishing more than one type of military operation, the North American P-51 proved to be a superb low-altitude co-operational fighter, the fastest high-altitude fighter, and a versatile dive bomber. Highly maneuverable, it was prominently used by the Royal Air Force in the raid on Dieppe in 1942. Recognized as the fastest single-seat fighter with the greatest range, it then accompanied heavy bombers on the longest missions. It has a top speed of 450 miles per hour, a service ceiling of 40,000 feet, a radius of 300 miles as a fighter-bomber, and of 750 miles as an escort fighter. In the Pacific area, the Mustangs escorted Superfortresses on their devastating bombing missions over Japan and also attacked Nippon on their own from Iwo Jima and other hard-won bases. In four months of operations, P-51 fighters, based on Iwo Jima flew 6,800 sorties against Tokyo, Nagoya, Kobe, Osaka and other targets as well as escorting B-29s over Nippon. It is powered by liquid-cooled V-type Allison engine of 1,150 horsepower. Later versions have a new "teardrop" canopy affording the pilot complete vision in all directions, and added firepower, namely, six .50-inch caliber machine guns. It can carry a tube jettisonable launcher under each wing for 4.5-inch aircraft rockets.

Lockheed P-38 (Lightning). This two-engine pursuit plane in spite of much criticism as a result of its pioneering design, has proved one of the world's greatest fighters and long-range bomber escorts. Extremely versatile, it is a triple-duty warplane, serving as a long-range, high or low altitude fighter as well as bomber and as a reconnaissance craft. The distinguishing twin-booms are the result of elongation of engine nacelles in order to hold the engine oil cooler, turbo-supercharger, Prestone radiators, and landing gear. Thus, the empennage consists of two booms which form the tail cone, two vertical stabilizers, two rudders and tabs, one horizontal stabilizer and one elevator and tab. The P-38J which came into mass production in 1944 was the 36th development of the Lightning including several designs never built. In dimensions, the Lightning is unusually big for a fighter. It has a wing span of 52 feet, an over-all length of 37 feet, 10 inches, and a gross weight of 18,000 pounds. The P-38 is powered by two turbo-supercharged 12-cylinder liquid-cooled V-1710 Allison engines with a military and take-off rating of 1,520 horsepower to 27,000 feet at 3,000 revolutions per minute. There are two Curtiss electric, three-bladed, constant speed, full feathering propellers. The eighteenth version, the P-38L, shows a level speed of over 425 miles per hour, a maximum range of 3,000 miles, a climb of better than 4,000 feet a minute, a service ceiling of over 40,000 feet, and a 4,000-pound bomb capacity. It

is armed with four .50 inch caliber machine guns grouped around 20-millimeter nose cannon. The P-38 can also carry bombs of 2,000 pounds. Its prowess in combat with Focke-Wulf planes over France and Germany led the Nazi aviators to dub it the "Fork-Tailed Devil."

Republic P-47 (Thunderbolt). This single-seat, one-engine fighter, one of the famous American pursuit planes, continued its remarkable performance as a bomber escort over Europe and as a foe of Messerschmitts and Focke-Wulfs. Powered by one Pratt & Whitney Double Wasp radial air-cooled engine of 2,000 horsepower, this mid-wing monoplane has a top speed of 450 miles per hour and a ceiling of 40,000 feet. The latest models have a combat radius of 1,000 miles. Some models also have a paddle propeller that adds 400 feet a minute to the fighter's climb. Well armored, with the appearance of a milk bottle, it is one of the heaviest of the American pursuit planes, weighing over 13,500 pounds. The wing span is 40 feet, 8 inches; over-all length, 36 feet; and height, 14 feet. It is armed with eight .50-inch caliber machine guns. Frequently each wing is fitted with racks for five rocket projectiles of 4.5-inch caliber. There is front and rear armor protection for the pilot, with bullet-proof glass. Thunderbolts were conspicuously successful in harrying Nazi columns in the Italian campaign. In the Pacific, in May, 1945, P-47N fighters based on Ie Shima launched a devastating attack on Kyushu. By November 1945, the Republic Aviation Corporation had made military deliveries of 15,329 of these fighter planes.

Grumman F6F (Hellcat). This single-seat one-engine Navy fighter came into mass production in 1944 and supplemented the famous F4F (Wildcat) which had made an enviable record in the battles for Guadalcanal and in the Mediterranean and Atlantic areas. Designed to outclass the Japanese Zeros in every respect, it is powered by a Pratt & Whitney engine with a rated 2,000 horsepower, as compared with the 1,200 horsepower of the Wildcat. It has almost twice the gross weight of 6,000 pounds possessed by its predecessor; and has a speed of over 400 miles per hour and a service ceiling of over 35,000 feet, as compared with the 300 miles per hour and 30,000 feet ceiling of the Wildcat. The wing span exceeds the 28 feet of the Wildcat, while the wings can be folded for compact storage on aircraft carriers. The armament is six .50-inch caliber machine guns.

Grumman F7F (Tigercat). The Grumman F7F was, in 1945, the first twin-engine produced for the Navy. It was an American answer to improved performance of new Japanese combat planes. A big plane, almost half again as heavy as the Hellcat, the F7F has twice the power of the F6F in its two Pratt & Whitney 2800 C Double Wasp engines, each developing 2,100 horsepower. The fighter-bomber has a speed of 425 miles per hour. The F7F is equipped with tricycle landing gear which makes it comparatively easy to handle on crowded carrier decks despite the great weight of the plane. In the Pacific, the F7F was used by the Marines as a land-based plane. It was designed also for aircraft carriers.

Grumman F8F (Bearcat). The latest version of the Navy's single engine fighter is the F8F. This light-weight carrier based fighter is powered by a single stage Pratt & Whitney 2,800 C Double Wasp engine, which turns up 2,100 horsepower and can develop even 2,800 horsepower with the aid of water injection. It is 3,000 pounds lighter than the F6F. The sea level speed is 400 miles per hour. It climbs 5,000 feet a minute with the aid of water injection. Armament consists of four .50-inch caliber machine guns mounted in the wings. Although this highly maneuverable fighter reached mass production too late to see action against the Japanese, it is already in operation aboard aircraft carriers in the Pacific.

Vought F4U (Corsair). Flown by U. S. Navy and Marine Corps pilots, the Corsair carried a large share of the assault on Japanese Zeros over the Solomon Islands in 1943. As a carrier-based fighter, the Corsair made brilliant performances in the Pacific area. In 1944, the long-range striking of the Vought F4U was demonstrated by its escort of Marine SBD Dauntless dive-bombers and Army B-25 Mitchell bombers during the attacks on the Ponape Islands. In the hands of the British Royal Air Force, Corsairs provided the escort for the dive-bombers that crippled the German *Tirpitz* in 1944 at Alten Fjord in Norway. With a Pratt & Whitney air-cooled Double Wasp engine, the F4U has a speed of 400 miles per hour and a service ceiling of 35,000 feet. The three-bladed propeller revolves in an arc of 13 feet, 4 inches, in diameter. Easily recognized by its inverted gull wings, the Corsair has a wing span of 41 feet, an over-all length of 33 feet and a height of 16 feet. A later version, the F4U-1D, capable of carrying two 1,000-pound bombs came into mass production in 1944. This type is armed with the usual battery of six .50-inch caliber machine guns.

Vought F4U-4 (Corsair). In July 1945, the Navy Department released information on the latest model Corsair which had already joined the fleet in the Pacific and was in combat with Japanese airpower over Nippon. The new type, built by the Chance Vought Aircraft Division of the United Aircraft Corporation, is powered by a Pratt & Whitney Double Wasp 2800-C engine. The engine is

rated at 2100 horsepower which can be increased in combat emergencies by use of water injections. This single seat, gull-wing monoplane has a wing span of 41 feet. The wings can be folded for storage on shipboard. It has a four-bladed Hamilton Standard propeller. Its speed is over 450 miles per hour; its ceiling is over 35,000 feet; and its maximum range, over 1,500 miles. It can climb 1,000 feet per minute. Its armament consists of six .50-inch caliber guns or else four 20 mm. cannon, and eight 5-inch rockets, four under each wing. It carries a bomb load of 2,000 pounds. The pilot is protected by bullet-resistant glass. Marine fighter pilots in the new Corsair made notable records in combat over Okinawa in March-May, 1945.

Bell P-59A (Aircomet). The strict secrecy regarding the first American jet-propelled plane was lifted in September, 1944. The Aircomet, built by the Bell Aircraft Corporation, retains many of the Aircobra lines. It has a slender fuselage, a long upswept tail, a wing span of 49 feet, a length of 38 feet, and a wing area of 400 square feet. It resembles most mid-wing single-seat fighters, although lacking a propeller. Weighing over 10,000 pounds, this plane flies 500 miles per hour. The two General Electric turbo jet engines take oxygen from the air through air-intake ducts under each wing and in front of the engine. Rotary compressors or high-speed fans force the air into the combustion chamber. The air is mixed with kerosene, and combustion causes constant high pressure, forcing the gases through a turbine. Rearward, the jet engine is nozzled down for greater force by a narrow tailpipe which increases the velocity of the emerging gas to give the plane its thrust. Lack of a propeller permits the plane to stand lower to the ground, making it easier for mechanics and ground crews to work on it. It has an extended nose and tricycle landing gear. This is the first American type in mass production of a plane that is expected to revolutionize combat aircraft.

Northrop P-61 (Black Widow). In 1944, the Black Widow, the first American plane designed especially as a night fighter, came into mass production. Big as a bomber and fast as a fighter, this plane carries heavy armament of four 20-millimeter cannon under its belly and four .50-inch caliber machine guns in remote-controlled top turret. Powered by twin 2,000 horsepower Pratt & Whitney R-2800 eighteen-cylinder air-cooled engines, it has high speed. It has Curtiss electric four-bladed constant speed and full-feathering propellers. Weighing 25,000 pounds, it gives sufficient room for its crew of three specialists, namely pilot, radio operator and gunner. A twin-fuselage and twin-tail type of ship, the plane resembles an overgrown P-38 fighter. It takes off quickly, climbs sharply and has a slow landing spread for additional safety. On the battle-front it has proved an effective protection to Allied troops in night movements.

Douglas P-70 (Havoc). This twin-engine night fighter is a conversion of the A-20, with the forward compartment and bomb bays eliminated. It is an all-metal, high-wing monoplane with single tail and tricycle landing gear. The crew of two includes a pilot and a radio operator. The wings have a span of 61 feet, the length is 47 feet and the weight 19,000 pounds. The power plant consists of two Wright Cyclone R-2,600 fourteen-cylinder radial air-cooled engines of 1,700 horsepower each. With a speed of 325 miles per hour, it has a service ceiling of 25,000 feet. Armament includes four 20 mm. cannon carried in the belly.

Lockheed P-80 (Shooting Star). In August, 1945, the War Department released details regarding the latest jet-propelled fighter. The Shooting Star is a single seat, low-wing, all-metal fighter or reconnaissance plane with semi-monocoque fuselage. It is driven by a General Electric Super Jet Propulsion Turbine. Unlike conventional type engines, the G-E jet engine requires no warm-up for the take-off. The airplane is under way sixty seconds after the engine starts. Efficiency of the engine increases greatly with speed and altitude, making the Shooting Star a formidable pursuit plane. The wing span is 38 feet, and the length, 34 feet. Empty weight is 8,000 pounds and maximum operational weight is 14,000 pounds. Control surfaces of both wings and empennage are much smaller than those of conventional planes, and they total less than 45 percent of the area of the control surfaces of the Lockheed P-38. With no propeller slipstream or torque to overcome, rudder tops are eliminated. The cockpit, topped by a plastic bubble canopy and located forward of the wing in the Shooting Star's long slender nose, offers the pilot excellent visibility for maneuvers. This cockpit is pressurized from the G-E jet engine to give the pilot comfort in the stratosphere. The P-80 has a speed of nearly 600 miles per hour, and a service ceiling of over 45,000 feet. It is capable of carrying out missions assigned to conventional long-range fighter planes. Droppable auxiliary fuel tanks, mounted on inner shackles and faired into the extreme tips of the wings, furnish an extra supply of fuel. Armament includes six .50-inch caliber machine guns mounted in the nose, and two 500-pound bombs carried on wing-tip shackles. The Shooting Star is equipped with an electrical gyro-load computing type gun-sight with a reflex optical system. There are self-sealing fuel tanks, armor glass windshield, steel armor plate on

front bulkhead and behind the pilot, and dural plate aft of front of bulkhead.

Ryan FR-1 (Fireball). On September 26, 1945, the Navy Department released information regarding a revolutionary fighter plane which uses both conventional propellers and jet propulsion. It is also the first carrier-borne craft with tricycle landing gear. The conventional power plant is a 1,350 horsepower R-1820 Wright Cyclone engine which turns a three-bladed Curtiss Electric propeller. The jet propulsion is provided by a General Electric I-16 unit, modified to use the same fuel as the reciprocating engine, thus avoiding the need for dual fuel systems. The Wright Cyclone engine is housed in the nose of the FR-1, while the jet unit is found just aft the wing trailing edge. The conventional engine will drive the Fireball at a speed of 320 miles per hour, while the General Electric jet engine gives a speed of 300 miles per hour. The speed with both engines is over 400 miles per hour. The FR-1 can climb at an amazing rate. Wing span is 40 feet; and length, 32 feet. The height with folded wings is 16 feet, 9 inches. The empty weight is very low, being only 7,475 pounds. Armament includes four .50-inch machine guns, two 1,000-pound bombs, and four HVAR rockets, two being under each wing.

McDonnell FD-1 (Phantom). In 1945, the Navy developed the first exclusively jet-propelled fighter plane for operation on aircraft carriers. The FD-1, manufactured by the McDonnell Aircraft Corporation, of St. Louis, Missouri, is a single-seat interceptor, with a wing span of forty feet. The wings fold back electrically; when rigged for storage, the FD-1 is only 16 feet wide. Power is provided by twin axial-flow Westinghouse turbo-jet engines built into the wing roots. The engines, which are exclusively American design, contain no long scoops or ducts. When take-off assistance is needed, either standard carrier catapults or Jato (jet assisted take-off) units may be used. The Phantom is built of light aluminum alloy polished to a finish which offers little resistance. The speed of the interceptor is rated over 500 miles per hour. It has an amazingly high rate of climb, a service ceiling of seven miles in altitude, and a range of 1,000 miles. The Plexiglass cockpit canopy, which is located forward of the engines, resembles an elongated bubble. Armament consists of standard fighter guns or cannon mounted in the nose.

Boeing XF8B-1. This versatile low-wing single-engine monoplane fighter can be used as a bomber, torpedo plane, attack plane and interceptor. It has a speed of 375 miles per hour and a service ceiling over 30,000 feet. Armament includes six 20-millimeter cannon.

Heavy Bombers

Boeing B-17 (Flying Fortress). This renowned pioneer of four-engined heavy bombers continued in 1945 to make aviation history in every theater of the war. The first model was built as early as 1936. Originally designed and built by the Boeing Aircraft Corporation, it is now also built by Douglas and Lockheed. The B-17G version, largely employed in 1945, is powered by the usual four Wright Cyclone engines, with turbo-superchargers, each engine with a rated 1,200 horsepower. It has a normal cruising range of 3,000 miles, a top speed of over 300 miles per hour and a service ceiling of over 40,000 feet. Its empty weight is 36,000 pounds and its gross weight, 65,000 pounds. Its wing span is 103 feet, 9 inches; its length, 74 feet; and its height, 19 feet. The crew varies from six to eleven. Armor plate protects pilot, co-pilot, top gunner, tail gunner and side gunner. The *Flying Fortress* carries thirteen .50-inch caliber machine guns, eight of them arranged in pairs in four turrets (chin, top, ball and tail). Five single .50-inch caliber guns are fitted, one in the top of the radio compartment, two amidship and two in the nose section. Bomb rackage varies. The latest version includes both internal and external racks carrying a total bomb load of 6,000 pounds. After V-E Day in Europe, many units of B-17's were sent directly to the Pacific, and others were redeployed to the United States to serve for training.

Consolidated B-24 (Liberator). The Consolidated Vultee Liberator B-24 is a heavy, long-range bomber with a distinguished record. It is an all-metal, high-wing monoplane with hydraulically operated tricycle landing gear and Fowler flaps. It has a deep-bellied fuselage and a twin tail. It is powered by four Pratt & Whitney Twin Wasp R-1850 fourteen-cylinder radial air-cooled engines of 1,200 horsepower, with turbo-superchargers. The propellers are Hamilton Standard, three-bladed, constant speed, and full feathering type. The plane has a maximum range of more than 3,000 miles and a maximum speed in excess of 300 miles per hour. It has a service ceiling of over 35,000 feet. Its empty weight is 34,300 pounds and its gross weight, 60,000 pounds. Its wing span is 110 feet; its over-all length, 66 feet; and its height, 17 feet. The crew varies from nine to eleven. Five power-operated gun turrets are equipped each with two .50-inch caliber machine guns, guarding the plane from every angle. It carries a bomb load of 6,000 pounds. Armor covers all crew members in battle station from rear and front. This bomber has made outstanding records in the Pacific area, the Aleutians, North Africa, France and Germany. In

the Pacific, in 1945, B-24s made conspicuous performances in bombing Japanese oil-producing centers in Borneo.

Boeing B-29 (Superfortress). Powered by four Wright Cyclone R-3350 eighteen-cylinder radial, air-cooled turbo-supercharged engines each rated at 2,200 horsepower for take-off, nearly twice the power of the *Flying Fortress*, the B-29 was especially designed for the bombardment of Japan. A mid-wing, all metal monoplane with a tricycle landing gear, the *Superfortress* is twice the gross weight of the *Flying Fortress*. The B-29 has a wing span of 141 feet, a length of 98 feet and a height of 27 feet. The maximum weight is 135,000 pounds. The engines turn, through reduction gears, four-blade Hamilton Standard propellers with a diameter of 16 feet, 6 inches, the largest propellers in use on modern airplanes. The reduction gears, built especially for this bomber and of the lowest ratio ever used on an airplane, turn the propellers but 85/100 times as fast as the rate per minute of the engines. This immense reduction is necessary inasmuch as aerodynamic reasons require the speed of propeller tips to be below the speed of sound, and yet to utilize the maximum power of the engines. Operating through these gears, the propellers turn slower than those of any other airplane, but the speed of the propeller tips, because of their greater diameter, compares with the speed of the tips of the propellers of other planes. Each engine on the *Superfortress* has twin exhaust-driven turbo-superchargers. All moving equipment is activated either by an electric motor or cables, with the exception of the braking system which alone is hydraulic. Armament consists of power turrets with multiple .50-inch caliber machine guns. The 1945 models had 13 machine guns located as follows: two in the Sperry mid-upper turret, two in the lower turret, two in the chin turret, two in the nose, one in the radio compartment, and one on each side at waist position. A flight engineer is included in the crew of eleven members and thus the pilot's instrument board has only the flight, manifold pressure and tachometer instruments. The co-pilot's board has flight instruments and indicators for landing gear, wing flaps, and propeller governors. The navigator's station is equipped with a table, a map wheel, driftmeter, flashlight, storage space, and instrument board. There are two bomb bays, one forward of the wings, and the other aft. Inasmuch as these bays are not located at the center of gravity of the ship, an alternating system of dropping bombs is used in order to avoid changing the trim of the ship when unloading. The B-29 has three pressurized sections, namely, the pilots' control cabin in the nose, the gunners' compartment midships and the tail gunner's section. The first two pressurized sections are connected by a long tube-like tunnel, large enough to crawl through, which spans the double bomb bays of the *Superfortress* and permits access between the two sections while the plane is in flight. The tail gunner is separated from the other pressure sections by an unpressurized portion of the B-29's fuselage in the rear part of the plane. The maximum speed is over 350 miles per hour, while the landing speed is 100 miles per hour. The service ceiling is over 35,000 feet, and the maximum range over 4,000 miles. The bomb load is twelve tons. All *Superfortresses* in combat in World War II were assigned to the Twentieth Air Force, commanded by General of the Army Henry H. Arnold. The B-29s led the way in the Allied assault on Japan's homeland. The first tactical mission occurred on June 5, 1944, over Bangkok, in Burma, from China. The first mission of the B-29s over Japan was on June 15, 1944, when a group of *Superfortresses* belonging to the American Twentieth Air Force stationed in China carried out the second bombing raid on Japan, striking at the Yawata Steel Works on Kyushu. Later, Japan was bombed by *Superfortresses* from the island base at Saipan. In 1945, the B-29s based on Iwo Jima, Ie Shima, Okinawa and other islands inflicted the devastating raids on Japanese industrial cities. *Superfortresses* also carried the two atomic bombs dropped on Hiroshima and Nagasaki in August, 1945. Designed by the Boeing Aircraft Company of Seattle, the B-29s are built by this company and also the Bell Aircraft Corporation and the Glenn L. Martin Company.

Consolidated Vultee B-32. In July, 1945, the Army released data regarding its latest superbomber. Featuring heavy firepower and bomb load, the B-32 was designed for operations in the Pacific. It saw service with the Far East Air Forces of General George C. Kenney in the last months of the war. Only a trifle smaller than the *Superfortress*, the new B-32 is an all-metal, high-wing, single tail monoplane with a cylindrical semi-monocoque fuselage and a modified Davis low-drag wing with Fowler type flaps. The tricycle landing gear, which uses dual tires, is fully retractable and has a completely swiveling nose wheel. Power is supplied by four double row eighteen-cylinder Wright Cyclone engines of 2,200 horsepower, each equipped with two exhaust-driven turbo-superchargers. The Curtiss four-bladed electric propellers have a diameter of 16 feet 8 inches, and are equipped with Curtiss automatic synchronizers. Propellers on the two inboard engines have reversible pitch blades for braking during the landing run. Wing span is 135 feet; and length, 88 feet. The unusual size of the single fin of the tail gives such

stability that the B-32 can be held on course with minimum effort even though both engines on one side are cut out. The B-32 has a gross weight of 130,000 pounds as compared with the 185,000 pounds of the Superfortress. It can carry a bomb load of 15,000 pounds. Service ceiling is well over 30,000 feet. The normal crew is eight in number.

Curtiss XP-55 (Ascender). Among the experimental warplanes, the XP-55 is a pusher-type plane whose details were disclosed in 1945. Unlike the conventional plane, the power plant, propeller, and wings are mounted to the rear of the pilot, giving the XP-55 the appearance of flying backwards. Rudders are located near the ends of the swept-back wings, and the elevators are in the extreme nose—diametrically opposite to the conventional aircraft. Clustered in the nose of the XP-55, the guns are fired straight ahead and need not be synchronized to fire through the propeller. The plane is powered by a 1,275-horsepower Allison engine. The XP-55 has great speed, improved longitudinal control and maneuverability, and superior visibility and search view.

Medium, Light and Dive Bombers

North American B-25 (Mitchell). The Mitchell bomber continues to be one of the most versatile planes of the Army Air Forces. The latest B-25J version, a six-seat, twin-engine plane, has cantilever wings with a wing span of 67 feet and an overall length of 53 feet. The fuselage is a semi-monocoque structure of aluminum alloy. The tail unit has one horizontal and two vertical stabilizers. Power is furnished by two Wright Cyclone R-2600 fourteen cylinder radial air-cooled engines in semi-monocoque nacelles. The crew of pilot, co-pilot, radio operator, waist gunner and tail gunner can interchange positions in flight. The pilot's cockpit is forward of the propellers. Internal bomb storage is in the fuselage beneath the center section. A total of twelve .50-inch caliber machine guns are distributed, two in the nose, four on each side of the fuselage, two in the upper turret, two in the waist and two in the tail. The speed is over 300 miles per hour, and there is a service ceiling of 25,000 feet. The empty weight is 20,300 pounds and the gross weight over 35,000 pounds. Another version, the B-25H, holds eighteen guns, eight of them being .50-inch machine guns located in the nose. The bomb load is 4,500 pounds. Recent revisions carry tube launchers for 4.5-inch aircraft launchers. An earlier version of the Mitchell Bomber was used in Major Doolittle's historic raid on Tokyo in April, 1942. In 1945, Mitchell bombers of the Fifth Air Force, based on the Philippines dominated the Japanese ship lanes in Southeast Asia.

Martin B-26 (Marauder). The B-26C version of the Marauder retains the mid-wing monoplane design with an all-metal monocoque. Each of its two Pratt & Whitney Double Wasp 19-cylinder engines rates 2,000 horsepower. The propellers are Curtiss automatic electric, four-bladed and full feathering, with diameters of 18 feet and 6 inches. The wingspan is 71 feet; over-all length, 53 feet; and height, 21 feet. The plane has a range of 600 miles, a speed of over 300 miles per hour and a service ceiling of 20,000 feet. Its gross weight is 35,000 pounds. It has power turrets, self-sealing fuel tanks and protective armor. Its armament includes twelve .50-inch caliber machine guns, including four in the power turrets. It carries a bomb load of 4,000 pounds. Although the Marauder is a bomber, it is faster than most fighter planes of Germany in World War II. Marauders gave brilliant performance in 1945 in the bombardment of German railway centers.

Douglas A-20 (Havoc). Known to the Army Air Forces as the Havoc and to the Royal Air Force as the Boston, this Douglas attack bomber proved to be one of the most versatile warplanes in World War II. It was extensively used throughout 1945, although its manufacture ceased in 1944. It is an all metal mid-wing monoplane with a wing span of 61 feet. Two 14-cylinder 1,600 horsepower engines drive Hamilton Standard Hydromatic propellers of 11 feet, 8 inches, diameter. As a medium bomber, it is well adapted to precision bombing. As a night fighter or intruder, the interchangeable nose permits the installation of detection equipment including a powerful searchlight with which RAF Bostons pointed out and blinded the crews of enemy planes. Carrying a crew of three, and equipped with an attack nose with six .50-inch caliber machine guns, and possessed of great maneuverability, the Marauder is a formidable day-fighter.

Douglas A-26 (Invader). The Invader succeeded the Douglas A-20 as the newest and fastest all-purpose bomber of the Army Air Forces. It is designed to carry an extremely flexible selection of machine guns, cannon, bombs and fuel, making its offensive striking power adaptable to many different combat situations. A monoplane, much like the Havoc, it employs the low-draw (laminar flow) airfoil wing section. The wing span is 70 feet; the length, 51 feet; and the weight, 30,000 pounds. Equipped with twin 2,000 horsepower Pratt & Whitney R-2800 series engines, it has a new double slatted flap which reduces landing speed and assists the take-off. Rated at a speed of 350 miles per hour, this light bomber has a service ceiling of 30,000 feet. Armament consists of various combinations of .50-inch caliber guns and 20 or 37 or 75 millimeter

cannon. One version with Plexiglass nose has six .50-inch caliber guns in the nose and four .50-inch guns in the turrets. The standard attack version carries eighteen .50-inch guns. The A-26 has a crew of three.

North American A-38. This single seat light attack bomber, constructed as an all-metal, low-wing monoplane with single tail, was developed from the North American P-51 and is similar in appearance to the Messerschmitt 109E. It is equipped with bomb racks and diving brakes. The crew consists of one pilot. Wing span is 37 feet; length, 32 feet; and height, 11 feet; while the weight is 10,000 pounds. Powered by one Allison liquid-cooled V-1710 engine of 1,200 horsepower with two speeds, the plane has a Curtiss electric three-bladed propeller. The speed is over 400 miles per hour; the service ceiling, over 25,000 feet; and the tactical radius, 200 miles. The bomb load is 1,000 pounds. Armament consists of six .50-inch caliber guns, two in the nose and four in the wings.

Douglas XB-42 (Master). The latest type of medium bomber in the Army, the experimental XB-42, is a radical departure from the conventional bomber design in that it is driven by two counter-rotating Curtiss propellers located at the extreme rear of the fuselage, behind the tail surfaces. Two Allison V-type liquid-cooled engines mounted in the fuselage drive the counter-rotating propellers, thus eliminating the necessity of engine nacelles installed on the wings. This affords maximum aerodynamic effect. The bomber carries a crew of three. Pilot and gunner sit side by side in a Plexiglass canopy. The bombardier-navigator sits in the extreme nose inside a Plexiglass compartment resembling the nose of the Douglas A-26. The two engines of the XB-42 are located just aft of the pilot's compartment and are connected to the dual rotation propellers by steel drive shafts. Each propeller is independently driven and either one can be feathered when desired. Because of its radical design, the XB-42 features a special emergency procedure for bailing out. The entire propeller installation can be blown off by a detonation switch, thus eliminating the possibility of crew members tangling with the propellers. The bomber has a wing span of 70 feet, and a length of 53 feet. Its empty weight is 19,149 pounds. Fully loaded, it weighs 35,585 pounds. It can carry a bomb load 5,000 miles. The fuselage is designed to take a 4,000-pound bomb, a larger bomb than most medium bombers can carry. The speed is beyond 400 miles per hour. Armament includes several forward firing .50-inch caliber guns and several 75-mm. cannon. Wing guns mounted to fire to the rear are another unusual feature.

Douglas SBD (Dauntless). The Dauntless dive-bomber, known to the Navy as the SBD, continued its effective career, although production of this monoplane was discontinued in July, 1944. While the Dauntless is a Navy plane, it met its greatest ordeal and triumph in the autumn of 1942 when it took to the beach and operated as a shore-based bomber off Henderson Field on Guadalcanal. Here it defeated the "Tokyo Express" bearing night after night Japanese reinforcements for Guadalcanal.

Grumman TBF (Avenger). The Avenger is a carrier-based torpedo bomber that has supplanted the Douglas TBD (Devastator). This three-seat monoplane is powered by a single Wright engine of 1,700 horsepower. It has a cruising range of 1,000 miles and a top speed of over 250 miles per hour.

Navy Patrol Bombers

The Navy's patrol bombers included several land planes and flying boats. As a land plane, the Navy still used in 1945 the Vultee PBV-5 (Catalina). This type which has been in service since 1936 has been employed in many tasks from reconnaissance, through transport and ocean rescue, to torpedo bombing. The amphibious version of the PBV-5 has landing wheels retracting into the side of the hull. Powered by two 1,200 horsepower Pratt & Whitney engines, the high-winged Catalina has a wing span of 104 feet, a length of 64 feet and a height of 18 feet, with a maximum range of 4,000 miles and a gross weight of 35,000 pounds. The Vega PV-1, the Navy's version of the Vega B-34 (Ventura), remains a chief prop in the Navy's offshore anti-submarine patrol. Another competent flying-boat, the Martin PBM-5 (Mariner), manufactured by the Glenn L. Martin Company, of Baltimore, Maryland, is used as a transport plane as well as an anti-submarine patrol. Driven by two 2,000 horsepower Wright Cyclone engines, the Mariner has high-gull, full cantilever wings. The wing span is 118 feet; the length, 80 feet; the height, 27 feet. Its speed is over 200 miles per hour, range over 3,000 miles, service ceiling over 20,000 feet and gross weight, 40,000 pounds. As a patrol bomber, the Mariner carries a crew ranging from six to twelve in number. Its armament consists of heavy caliber machine guns in nose, dorsal and tail turrets and also, side gun positions. Distinctive features include its gull wings and the marked dihedral of the stabilizer. It rendered valiant service in covering the beach-heads at Saipan, Guam, the Marshall Islands, the Marianas, the Philippines, Iwo Jima and Okinawa.

Trainers and Observation Planes

The BT-18A (Valiant), built by the Consolidated Aircraft Corporation, is extensively used by the Army for

basic training. The Navy version of this two-seat trainer is the SNV-1. Powered by either a Pratt & Whitney 450 horsepower motor or a Wright 420 horsepower engine, this low-wing plane has a span of 42 feet, a length of 26 feet and a height of 9 feet, with a gross weight of 4,000 pounds. It has a service ceiling of 21,000 feet and a maximum speed at sea level of 180 miles per hour. In the North American AT-6 (Harvard), also a closed, two-seat, monoplane trainer, thousands of pilots in the air forces of the United Nations have received their advanced flying instruction. The AT-6, as well as the Navy's version SNJ, is driven by a Pratt & Whitney engine. It has a high speed of 305 miles per hour and a service ceiling of 21,500 feet. The Beech AT-10 (Wichita), a two-seat trainer, is driven by two 295 horsepower Lycoming engines with a high speed of 200 miles per hour and it has a service ceiling of 19,800 feet.

On Dec. 31, 1945, the Army released information regarding the Republic XF-12, a giant experimental photo reconnaissance plane. The wing span is 129 feet, 2 inches; and the length, 98 feet, 9 inches. Powered by four Pratt & Whitney engines, each developing 3,000 horsepower, the XF-12 is designed to operate in the upper altitudes at a speed of 400 miles per hour and a range of 4,000 miles. There are three camera stations—one vertical, one split-vertical and one tri-metrogon. The XF-12 carries radio and radar equipment, dark room apparatus for storing and loading film, and flash bombs for night photography.

Liaison Planes

Among the Liaison planes, the Army continues the use of the L-2 Grasshopper. This is a single-engine, high-wing monoplane of welded steel tube construction with fabric covers, manufactured by the Taylorcraft Aviation Corporation. The wings, of solid spruce spars, with metal ribs and fabric covered, have a total wing span of 35 feet. The weight is 1,300 pounds. Powered by a 65 horsepower Continental engine, the L-2 has a speed of 100 miles per hour and a range of 300 miles. The plane uses a two-bladed wood propeller. The crew numbers two. Grasshoppers L-3 and L-4 are also in use. The L-5 Sentinel is driven by a 185 horsepower Lycoming engine and has a speed of 125 miles per hour.

American Transports

Throughout 1945, the Army and the Navy continued the use of the following cargo and utility transports.

Douglas C-47 (Skytrain). The two-engine Douglas C-47, known in England as the Dakota, is the wartime version of the reliable DC-3, the "work-horse of the air." The C-47 is an all-metal, low-wing monoplane, with hydraulically operated landing gear and flaps. It has a normal crew of four, namely pilot, co-pilot, radio operator and aerial engineer. The wing span is 95 feet; the length, 64 feet; and the height, 17 feet; while the weight is over 29,000 pounds. Powered by two Pratt & Whitney Twin Wasp R-1830 fourteen-cylinder radial air-cooled engines of 1,200 horsepower, the C-45 uses Hamilton Standard hydromatic three-bladed propellers. The speed is over 200 miles per hour, with a service ceiling of 22,000 feet and a range of 1,500 miles. The DC-3 and its military conversion made a valiant record in flying Lend-Lease supplies over the Hump to China on the famous Burma-China air route. Another version, the C-49 (Skytrooper) was used in World War II primarily for the transport of paratroopers.

Douglas C-54 (Skymaster). The Douglas C-54, a military adaptation of the DC-4 commercial airliner, served the armed forces throughout 1945 on several transoceanic routes. This four-engine transport has a cargo capacity of a standard box-car. It is an all-metal, low-wing monoplane with single tail, and also a tricycle landing gear. It has a hydraulically operated flap and nose wheel. The crew numbers six. The wing span is 117 feet and the length, 93 feet; while the maximum weight is 60,000 pounds. Power is supplied by four 1,100 horsepower Pratt & Whitney Twin Wasp R-2000 fourteen-cylinder engines. It has a rated speed of 275 miles per hour. The service ceiling is over 20,000 feet, while the maximum range was over 3,000 miles. A specially equipped C-54 was used by President Roosevelt in travel to foreign lands, including part of the journey to the Yalta Conference in 1945.

Curtiss C-46 (Commando). This twin-engine transport is constructed as an all-metal, semi-midwing monoplane with single tail and retractable landing gear. The crew numbers three or four. Wing span is 108 feet; length, 76 feet; and the maximum weight is 50,000 pounds. The power plant consists of two Pratt & Whitney Double Wasp R-2800 eighteen-cylinder engines, each of 2,000 horsepower. Curtiss electric four-bladed propellers are used. Rated at a speed of over 250 miles per hour, the C-46 has a service ceiling of 35,000 feet and a range of 1,800 miles. This plane is extensively used as a hospital ship. Each plane has a capacity of 33 litters.

Lockheed C-49 (Constellation). A new type of transport, the Lockheed C-49, made a sensational record in the Army Transport Command. Originally designed as a luxury liner capable of crossing the United States in nine hours, in 1945 this plane was adopted for military service

and went into an accelerated production program. A low-wing, semi-monocoque plane, the Constellation is powered by four Wright Cyclone R-3850 eighteen-cylinder radial air-cooled engines, each developing 2,300 horsepower. It flies at a top speed of 340 miles per hour, with a cruising speed of over 300 miles per hour. It has a non-stop range of over 5,000 miles and a service ceiling of 35,000 feet. The wing span is 123 feet; the length, 95 feet; and the height of the vertical tail, 23 feet. There is a pressurized cabin for flight in the stratosphere. The C-49 has capacity for 64 passengers and 6 crew, or it can hold 100 paratroopers with full packs and rifles. In April, 1944, on a routine flight, a Lockheed C-49 crossed the American continent from Burbank in California to Washington, D. C., in 6 hours, 57 minutes and 51 seconds, flying 2,360 miles, at a cruising speed, using 65 percent power. In August, 1945, it broke the non-stop New York-Paris trans-Atlantic record by covering the 3,600 miles in 14 hours and 12 minutes.

Consolidated C-87 (Liberator Express). The C-87, manufactured by the Consolidated-Vultee Aircraft Corporation in San Diego, is the transport version of the famous B-24 bomber. It is a four-engine, all-metal, high-wing monoplane. Wing span is 110 feet; length, 66 feet; and weight, 50,000 pounds. Power is supplied by four Pratt & Whitney Twin Wasp R-1830, fourteen-cylinder radial air-cooled engines each of 1,200 horsepower, with turbo-superchargers. Propellers are Hamilton Standard three-bladed. The crew numbers six. With a range of 4,000 miles and a speed of 300 miles per hour, the Liberator Express carries a load of six tons. As a cargo and transport plane in the Air Transport Command, the C-87 carried key personnel and vital cargo to all theatres of the war. In 1945, C-87s joined the fleet of DC-35 in flying supplies over the Hump to China.

Fairchild C-82 (Packet). One of the spectacular developments of World War II, the Packet, possesses cargo space actually larger than most boxcars. This rectangular room of 2,870 cubic feet has rear doors for end loading. This feature eliminates the 90-degrees turn of cargo involved in side loading. It thus accommodates longer cargo. The fuselage is 54 feet long, 10 feet wide and 13 feet high. Indeed, the principal design of the Packet is to carry bulky objects without dismantling them. It will thus hold intact armored tanks, trucks and artillery. The plane is also useful in the transport of paratroopers and in towing gliders. Wing span is 106 feet; over-all length, 77 feet; and height, 28 feet. As a military plane, the crew numbers five. A crew of only two is required in the commercial plane. The empty weight is 28,000 pounds; the gross weight, 50,000 pounds. The useful load amounts to 22,000 pounds. The maximum payload for 500 miles is 18,000; for 1,000 miles is 15,000 pounds, for 1,500 miles is 13,000 pounds. The plane is powered by two Pratt & Whitney Double Wasp R-2800 eighteen-cylinder radial air-cooled engines of 2,100 horsepower. It has a cruising speed of 207 miles per hour and a service ceiling of 26,000. The maximum range is 4,000.

Boeing C-97 (Cargo Transport). The C-97 produced late in World War II, is a four-engine transport constructed as an all-metal monoplane with single tail and tricycle landing gear. It is based on the super-bomber B-29 with a two-deck fuselage. Wing span is 141 feet; length is 110 feet; and height, 15 feet. The empty weight is 70,000 pounds, and the gross weight, 120,000 pounds. Driven by four Wright Cyclone R-3350 eighteen-cylinder radial air-cooled engines of 2,200 horsepower, the C-97 has a speed of 300 miles per hour, and a maximum range of 4,000.

The Army uses several smaller utility cargo aircraft such as the UC-43 (Traveler), the UC-45 (Expediter), the UC-61 (Forwarder), and the UC-64 (Norseman). The UC-43 is a single-engine personnel carrier. This biplane, with inverse stagger, has 5-place capacity including the crew. The wing span is 84 feet. It has a speed of 200 miles per hour and a range of 1,000 miles.

In the Navy, the R4D-1 and the R4D-5 are naval versions of the Douglas DC-8, the commercial transport plane built by the Douglas Aircraft Company before the war. The R5D-1 and the R5D-2 are naval versions of the Douglas DC-4 (Skymaster). A conspicuous record in the Naval Air Transport Service was made by the Consolidated Vultee PB4Y-3R, the Navy version of the Coronado PB2Y-3, which has carried heavy loads of men and equipment over long ranges. With a wing span of 115 feet, a length of 79 feet and a gross weight of 66,000, it is the largest of the mass-produced planes in Navy service.

The largest single transport in the service of either the Army or Navy is the 70-ton Mars built by the Glenn L. Martin Company, of Baltimore, Maryland. In November, 1943, the Mars flew on its first war mission for the Naval Air Transport Service. This was a non-stop flight from Patuxent River in Maryland to Natal in Brazil. On January 28, 1944, the Mars made its first flight from Alameda, California to Pearl Harbor. The round trip was completed three days later. Thereafter, the Mars remained in regular service with the NATS in the Pacific area. In November, 1943, Secretary of the Navy Frank Knox announced that the Government had ordered twenty of these giant flying boats. The Mars has a wing span of 300 feet, a length of 117 feet, and a height of 86 feet. With

two decks, it has a normal weight of 140,000 pounds. Powered by four 2,200 horsepower Wright Cyclone R-3350 engines, the propellers have a diameter of 16 feet and 6 inches. It requires a crew of 15 men. The Mars range is 4,375 miles.

British Types. Several advances in new types of combat aircraft were made in Great Britain in 1945. Among these were the de Havilland 100 Vampire fighter. The Vampire is the first twin-boom jet fighter manufactured by any of the Allies. It is powered by a DH Goblin turbine fitted in the fuselage and outlet placed in the rear of the nacelle. Top speed is 540 miles per hour. The construction is all metal, save the cockpit which is a wood carapace structure similar to that of the justly famous Mosquito. There are long cord ailerons, a small tail assembly and high mounted elevator. Wing span is 40 feet; length is 30 feet; and height, 9 feet, 9 inches. Four 20-millimeter cannon are set low in the nose.

Details were disclosed in 1945 regarding the Gloster Meteor, the first of Allied jet-propelled planes to go into action against the Germans. It was used in 1944 over England against the Nazi Fieseler Fi-103 flying bomb, and saw service in 1945 over Germany. This plane, built by the Gloster Aircraft Company, is a low-wing monoplane of all-metal construction, with a nose-wheeled tricycle undercarriage. The power plant consists of two jet turbine Rolls-Royce Welland or Derwent units. Fuselage and wings are constructed on the unit assembly system, and the two undercarriage bays, upper and lower airbrakes and the flaps are located between the jet nacelles and the center fuselage. The high tailplane necessitated by jet propulsion, splits the rudder into two parts. The Meteor carries four 20-millimeter British Hispano cannon. The jet units are placed on the spars of the wings, each wing spar dividing each jet unit into two parts. The wing span is 43 feet; length, 41 feet; and height, 13 feet.

The Royal Air Force continued its use of Britain's celebrated day and night fighter, the Bristol Beaufighter III, which proved highly adaptable for cooperation with army forces and in assignments as a Coastal Command torpedo-bomber. A two-seat, two-engine, mid-wing cantilever, all-metal monoplane, the entire armament is under the control of the pilot. There are four 20-millimeter cannon mounted in the bottom of the fuselage, and six .303-inch machine guns in the wings. The machine guns can be replaced by extra fuel tanks, while bombs and rocket installations can be carried under the wings. The rear cockpit aft of the wing in Fighter Command versions of the Beaufighter is occupied by a radio operator who also acts as lookout. All versions of the Beaufighter retain the characteristic cantilever, two-spar, center wing, while the tail has a high rudder and wide fins. Power is furnished by two 1,650 horsepower Bristol Hercules XVII engines. Torpedo-carrying Beaufighters have a speed of about 300 miles per hour and have a precise technique of dropping torpedoes at high speed. Bristol Beaufighters saw service in almost every theatre of World War II. Rocket-firing Bristol Beaufighters made a record in attacks on German coastwise shipping in the Adriatic. In Burma, they were particularly effective in machine-gunning Akyab when occupied by the Japanese.

The Hawker Typhoon, a single-seat fighter, continued to make enviable records in destroying locomotives and trains in enemy-occupied territory. This low-wing cantilever monoplane is driven by one 2,000 horsepower Napier-Sabre IIA 24-cylinder aero-motor, and has a high speed of over 400 miles per hour. Its armament includes four 20-

millimeter cannon or else twelve .303-inch Browning machine guns. The Hawker Tempest V, a later version of the Typhoon, came into mass production in 1944. Powered by the Napier-Sabre IIB, developing 2,400 horsepower at sea level, the new version possesses a re-designed elliptical wing incorporating a thin wing section that reduces laminar flow. Other developments improve its aerobatic handling. As a result, the Hawker Tempest V proved remarkably effective in chasing and destroying by gunfire in the air the flying bombs that Germany launched against England in 1944-1945. Equipped with four 20-millimeter cannon and one 1,000-pound bomb under each wing, the Hawker-Tempest V is one of the most deadly fighter-bombers in the RAF.

The latest version of conventional fighters in 1945 was the de Havilland Hornet. This plane approaches the probable ultimate perfection of the single-seat, airscrew fighter—a type that may soon make way for jet-propelled planes. The Hornet is designed to operate from carriers. The fuselage is all-wood, carapace structure, while the wings are a composite of double upper plywood skin and underskin of alloy with composite wood and metal spars. Powered by two Rolls-Royce engines of 2,700 horsepower each, the Hornet has a speed of 470 miles per hour. The airscrews rotate in opposite directions. The Fairey Firefly I, a two-seat reconnaissance Fleet fighter, powered by a 2,000 horsepower Rolls-Royce Griffon IIB motor, continued its outstanding exploits. In 1945, the Fairey Barracuda II, a torpedo bomber, powered by a single 1,645 horsepower Rolls-Royce-Merlin 32 engine, saw service with the Royal Navy. The Supermarine Spitfire continued as one of Britain's leading fighters. Another version, Spitfire XIV, a high altitude development of Spitfire XII, is the first of this type to be equipped with the 2,000 horsepower Rolls-Royce Griffon aero-motor. In order to transmit the greater power developed by the Griffon motor in the lower density of air at high altitudes, Rotol engineers have made a new departure in airscrew design by the use for the first time of five propeller blades. The Spitfire XIV has a high speed over 400 miles per hour. The Spitfire XV, which began service in 1945, is powered by a 1,890 horsepower Rolls-Royce Griffon VI. A rocket-assisted take-off is used. Maximum speed is well over 400 miles per hour. Indeed, all of the dive-bombing Spitfires have remained faster than their Nazi rival, the Junkers JU-87. In 1945, the Blackburn Firebrand T. F. IV emerged as a shipboard single-seat fighter for the Navy. Powered by a big Bristol Centaurus radial air-cooled sleeve valve motor, the latest version of the Firebrand has a top speed of 350 miles per hour and a climb of 2,600 feet per minute.

The Avro Lancaster remained in 1945 the largest of Britain's heavy bombers in mass production. Designed for large scale night attacks on Germany, the Avro Lancaster III actually carried a bomb of 22,000 pounds during the attack on Arnberg in Germany. Powered by four 1,280 horsepower Rolls-Royce Merlin XX engines or else by four 1,600 horsepower Bristol engines, this midwing cantilever all-metal monoplane had a wingspan of 102 feet, a length of 69 feet, and a height of 20 feet. It has a speed of 300 miles per hour, a maximum range of over 3,000 miles, and a gross weight of 63,000 pounds. The Avro Lincoln B Mk II began service in the Bomber Command in September, 1945. This heavy bomber uses four Packard Merlin 68-motors. The bomb load is 22,000 pounds. Other four-engine heavy bombers include

the Vickers-Armstrong Windsor, the Handley Page Halifax VI, and the Short Stirling III. The Vickers-Armstrong Windsor is powered by four Rolls-Royce Merlin 85-motors turning Rotol four-bladed airscrews. The Halifax VI, in service with the Bomber Command in 1945, enjoys greater climb, higher ceiling and more maneuverability than earlier types. Four improved Bristol Hercules motors give a total 7,200 horsepower. Maximum speed has been increased to 212 miles per hour with a flying weight of 60,000 pounds. With a crew of six, it has a bomb load of 13,000 pounds, and an armament of one .303-inch machine gun in the nose, four in the dorsal turret, and four in the tail turret. Wing span is 104 feet, and range is 2,000 miles.

The all-wood constructed de Havilland Mosquito, manufactured in 1945 in Canada as well as Britain, continued its remarkable role as a formidable bomber in the Royal Air Force. The Mosquito XVI, a two-man crew bomber, with twin Merlin engines, carrying a 4,000 pound bomb load, boasted a 1,500 mile range at fighter speed. Since May, 1942, when a full squadron bombed Cologne, the Mosquito shared conspicuously in both the night and day bombing of Germany. Inasmuch as the Mosquito is used at high altitudes as well as for strafing, a complete system of oxygen tanks is carried. The Mosquito XVIII, armed with one one-pound cannon and four .303-inch Browning machine guns, operated with the RAF Coastal Command and scored notable successes in attacks on German submarines. Other two-engine bomber types include the Bristol Beaufort, the Bristol Blenheim IVF, the Vickers-Armstrong Warwick V, and the Westland Whirlwind. The Vickers-Armstrong Warwick V, a reconnaissance bomber, served in Southeast Asia as well as in the Coastal Command. Powered by two 2,500 horsepower Bristol Centaurus VII 18-cylinder two-row radial motors, the Warwick V has a maximum speed of 290 miles per hour. Armament includes one .50-inch caliber machine gun in the nose, one gun in each beam position, and four .303-inch Browning guns in the tail turret. The bomb load is 6,000 pounds. The wing span is 96 feet, and the flying weight is 45,000 pounds. The crew numbers seven. A good record was made by the Armstrong Whitworth Albemarle. This twin-engine, mid-wing, reconnaissance bomber possesses a tricycle landing gear and in profile resembles considerably the North American B-25 Mitchell of the United States Army Air Forces. The new bomber has been extensively used as a transport and a glider-tow.

Among the cargo-transport planes, the Avro York is a re-designed version of the celebrated bomber. While using the same high-wing engine and landing gear as the combat Avro Lancaster, the fuselage is much longer and includes triple vertical stabilizers. The plane contains four Rolls-Royce Merlin XX engines. It has capacity for 55 passengers and shows a gross weight of 63,000 pounds. With a cruising range of 300 miles per hour, and a range of 4,890 miles, it surpasses the American Douglas C-54 (Skymaster). Other British transport types include the Armstrong Whitworth Ensign, the de Havilland Flamingo, and the Armstrong Whitely V.

Among flying boats, the Short Sunderland is a military version of the celebrated commercial Short Empire. The Sunderland III is a high-wing cantilever all-metal monoplane with a wing-span of 112 feet, a length of 85 feet, and an over-all height of 32 feet. Driven by four Bristol Pegasus XVIII engines, the Sunderland III has a top speed of 210 miles per hour. It has an empty weight of 34,500

pounds and a loaded weight of 58,000 pounds. Its crew numbers eleven. In 1945, the Short Shetland, the largest British plane, received its first test. This reconnaissance and patrol flying-boat has an empty weight of 75,855 pounds and a loading weight of 135,000 pounds. Wing span is 150 feet; length, 110 feet; and height, 39 feet. With power in excess of 10,000 horsepower, the Short Shetland can take-off with a run of less than 500 yards. It is driven by four 2,500 horsepower Bristol Centaurus air-cooled eighteen-cylinder sleeve-valve two-row radial motors. Maximum speed is 267 miles per hour at 4,000 feet.

Russian Types. Secrecy continues to veil many of the improvements in Russian aviation. In 1945, almost a fifth of the planes operated by the Red-Air Forces were Lend-Lease imports from the United States and Great Britain. American planes, like the Bell P-39 (Airacobra), are operated in Soviet Russia with practically the same parts as those used in the American Army Air Forces, the only difference often being that the American insignia are replaced by the Red Star. Russian aircraft production in 1945 was concentrated upon a number of well-tested planes. Among the fighters, the Yak-9 and the La-5 have had top production. The Yak-9 resembles the British Spitfire. It uses the same well-known in-line, single 1,100 horsepower, Vee twelve-cylinder liquid-cooled M-105 engine, as well as the long, slender fuselage, retractable landing gear and air-intake beneath the fuselage as in the earlier planes designed by the engineer Yakovlev. The wing span is 36 feet, and the length is 30 feet. The high speed is 345 miles per hour. Like most Russian fighters, the Yak-9 consists of considerable wood construction, although less wood than in the majority of fighters. The Yak-9 has wooden wing covering and ribs, steel and duralumin spars, a steel tube fuselage, and duralumin tail surfaces. Gross weight is 6,000 pounds. The La-5, designed by the engineer S. A. Lavochkin, unlike most Russian fighters, uses a 1,600 horsepower radial, air-cooled engine. Resembling the all-wood Lagg-3, this fighter has a wing span of 31 feet and a length of 28 feet. Its top speed is 370 miles per hour.

Among the heavy bombers, the TB-7 takes a prominent place. As a development of the TB-6, the new version is driven by four 1,300 horsepower liquid-cooled AM-38 engines. Gross weight is 49,280 pounds. Top speed is 280 miles per hour, and its service ceiling is 25,000 feet. The crew numbers eleven.

The PE-2, an Ilyuchin design, resembles the German Messerschmitt Me-110. It has a wing span of 60 feet, a length of 45 feet and a height of 13 feet. Powered by two 1,300 horsepower M-105 twelve-cylinder Vee-type liquid-cooled engines, it shows a high speed of 310 miles per hour. This three-place light bomber is designed for low-level attack. The bombardier lies prone in the nose beneath the pilot and the rear gunner sits in the pilot's canopy, thus placing all the crew ahead of the wings. Most cherished of all Russian planes, because of the fact that it has no American or European counterpart, is the Stormovik. The Il-3 version, a two-seat assault bomber, has a wing span of 49 feet, a length of 38 feet and a height of 10 feet. Powered by one 1,300 horsepower Toupolev engine, it claims a high speed of 280 miles per hour. Although relatively slow and not highly maneuverable, the Stormovik continued in 1945 its outstanding record in low-level attacks against the German *Wehrmacht*. The pilot's cockpit is a raised canopy above the wing, while there is a partly

open cockpit for the rear gunner. The Stormovik carries either four 250-pound rocket bombs or else one 1000-pound bomb. Its armament includes two 32-millimeter wing-mounted cannon and four .50-inch caliber machine guns.

Many of the Russian cargo-transporters are but versions of the American Douglas DC. The L-760, however, is an ambitious Toupelev design. With a wing span of 120 feet, its wing span exceeds that of the American Mars. Powered with six 1,100 horsepower Hispano-Suiza type M-100 engines, the L-760 has attained a high speed of 185 miles per hour, and a range of 1,860 miles. With a gross weight of 103,000 pounds, it has a 64 passenger capacity.

French Types. With the liberation of France from Nazi slavery, the revival of French aeronautics occurred. The first French prototype to fly after the Allied expulsion of the Germans was a new French transport plane, the S. O. 30 Bellatrix. It mounts two Gnome et Rhône 1,260 horsepower supercharged motors which give a cruising speed of 240 miles per hour. It has capacity for 22 soldiers and their equipment, and has a range of 1,240 miles. The large Latécoere 631 six-engine flying boat, which was dismantled and hidden during the German occupation of France, was re-assembled. In March, 1945, it made its first test flight. The Bloch 181, a four-engine, low-wing monoplane, is now in service on French civil air lines. It is driven by four 1,050 horsepower Gnome et Rhône N-38 and N-39 motors, giving the plane a maximum speed of 267 miles per hour. The wing span is 96 feet and the loaded weight 37,600 pounds. The Bloch 181 carries 33 passengers and 20 by night.

German Types. One of the most sensational developments of the year 1945 was the mass production of the German jet-propelled fighter Messerschmitt Me-262. Due to a bungling project of Hitler, the Me-262 was limited at first to bombing. When the Me-262 was finally produced as a fighting plane, the Allies were already at the Rhine and even the new paragon could not stop them. The plane had astonishing speed, well over 580 miles per hour or over one mile in six seconds. American pilots, in conventional planes had the sensation of standing still when a Me-262 shot by them. The Me 262H-4 version was powered by two Junkers Jumo 004 B-4 turbo jet units, each with static thrust at sea level of 1,980 pounds. It had a wing span of 41 feet, a length of 34 feet and a loaded weight of 13,450 pounds. It had a climb of 4,700 feet per minute and a service ceiling of 20,000 feet. The Me-262, a low-wing cantilever monoplane, was armed with four 30-millimeter MK-108 cannon mounted in the nose; it carried bombs under the wings. A new feature was a device whereby the cockpit canopy, pilot's seat and pilot could be catapulted clear of the plane when necessary to bail out. The Me-163 was a much smaller plane than the Me-262. With swept-back wings, no horizontal tail surfaces, and a device for dropping the landing gear after the take-off, the Me-163 reached a top speed well over 500 miles per hour. Another jet propelled plane, the Heinkel He-280, had elliptical wings with pointed tips, typical of Heinkel designs. The wing span was about 40 feet. Powered by two Junkers Jumo jet-propulsion units, the He-280 did not attain the speed of its Messerschmitt compatriot. The Heinkel He 162A-1, known as the *Volksjäger* (People's Fighter) was also a jet plane. It came into service only toward the end of the war. Fitted with one Jumo 004 Heinkel-Hirth turbo-jet, this small fighter, having a weight of only 4,820 pounds, reached a top speed of 522

miles per hour. Its armament consisted of two Mk 108 30-millimeter guns or two MG 151 20-millimeter cannon. Its duration was only twenty minutes at sea level or a range of only 135 miles, too short to be of great operational value. It was the first German plane to employ a pilot ejection seat. In 1945, the Messerschmitt Me-410 completely replaced the Me-210 in service on all fronts of *Festung Europa*. The wing span of this low-wing cantilever monoplane was 53 feet, and the length, 40 feet. Powered by two 1,721 horsepower Daimler-Benz DB603 twelve-cylinder Vee liquid-cooled engines, the Me-410 achieved a maximum speed of 390 miles per hour. Its armament consisted of two 7.9-millimeter MG17 machine guns and two 20-millimeter cannon in the nose of the fuselage and fired by the pilot. There were two 18-millimeter MG131 guns in faired blisters, one on each side of the fuselage, remotely sighted and controlled by the rear gunner. A contact-breaker device interrupted firing when the guns, which were electrically fired, pointed at any part of the airplane's structure. The bomb compartment was in the nose of the fuselage beneath the pilot's cockpit and carried either two 550-pound bombs or else one 1,100-pound bomb. In place of this internal load, however, the Me-410 possessed an external carrier beneath the fuselage capable of supporting a 2,200-pound bomb.

The latest development of the Focke-Wulf was the Fw 190D, which went into operational service in the *Luftwaffe* in the year 1945. This single-seated, one-engine fighter had a wing span of 34 feet 6 inches, an over-all length of 33 feet, and a height of 12 feet. It had a gross normal weight of 8,600 pounds and a gross maximum weight of 10,350 pounds. Powered with a single Junkers Jumo 213 engine, the Focke-Wulf 190D showed a maximum speed of 450 miles per hour. The electrical system of the Fw 190 was complicated by the fact that four of the six guns, namely the two 7.92-millimeter machine guns in the top cowlings and the two inboard 20-millimeter Mauser cannon, must be synchronized to fire through the airscrew. The synchronizing units were mounted behind the engine. In addition, the Fw-190 carried two 20-millimeter Oerlikon cannon outboard in each wing. All of the versions of the Focke-Wulf Fw-190, like many German planes, made extensive use of ball-bearing equipment which was found throughout the complicated differential bell cranks as well as wherever moving parts were joined and in all the electric reduction gears and motors. Another development used on the western front was the Focke-Wulf Fw-191, the Moskito. This was a two-engined monoplane, designed as a fighter and light bomber. The Focke-Wulf Ta152, designed by Professor Kurt Tank, was fitted with a Jumo 213E engine which gave this new jet fighter a speed of 425 miles per hour at an altitude of 35,000 feet and 472 miles per hour at an altitude of 41,000 feet. A new multi-purpose plane was the Dornier Do 335T. This fighter plane was propelled by two airscrews, one in the front and one in the rear. The power plant was two 1,700 horsepower Mercedes-Benz DB 603 motors. The wing span was 47 feet and the weight, 23,600 pounds. With a maximum speed of 472 miles per hour at an altitude of 21,000 feet, it was the fastest German airscrew propelled plane.

Among the two-engined heavy bombers the prevailing types included the Dornier Do-2172, the Heinkel He-177 and the Junkers Ju-88A4. The four-engined heavy bombers included the Heinkel He-274 and the Focke-Wulf Fw-200 C. The most

unusual feature of the He-177, known as *Der Greif* (the Griffin), was the use of two double engine units, each unit driving one four-bladed tractor airscrew. In other words, each power plant assembly consisted of two Daimler-Benz DB605 liquid-cooled inverted Vee twelve-cylinder motors mounted side by side and geared together. The Focke-Wulf Fw-200C was a militarized version of the famous Kurier or Condor which played a conspicuous role in German commercial aviation before World War II. Fitted with four 940 horsepower Bramo-Fafnir radial air-cooled engines, the Fw-200C had a top speed of 250 miles per hour. The bomb bay lay beneath the fuselage, while external bomb racks were attached under the wings beyond the outboard nacelles. The normal bomb load was 3,300 pounds. The Fw-200C served in long-range overseas reconnaissance, mine-laying and convoy attack.

The Arado Ar 234B-2 was another jet-propelled plane used for reconnaissance and bombing toward the end of the War. Powered by two Jumo 004 B-4 Turbo-jets, this 20,000-pound plane had a speed of 470 miles per hour at an altitude of 19,000 feet. A newer development with four BMW 003 turbo-jets had a speed of 540 miles per hour at 20,000 feet, with a climb of 3,600 feet per minute at sea level.

Among the cargo transports, the Junkers Ju-52 was still widely employed for troop transportation. Powered by three 760 horsepower BMW engines, this military conversion of a commercial plane had a wingspan of 95 feet, a length of 62 feet and a height of 14 feet. It had a top speed of 189 miles per hour and a range of 1,000 miles. Small indeed was this plane in comparison with the Messerschmitt Me-323. This monster troop transport had a wingspan of 181 feet, a length of 93 feet and a height of 24 feet. Six 750 horsepower Gnome-Rhône engines were carried on the high wings. The Me-323 had a maximum speed of 170 miles per hour and a range of 500 miles. With a gross weight of 65,000 pounds, it had capacity for a 22,000 pound cargo or 130 troops. The loss of 37 of these gigantic ships in the Nazi evacuation of Tunis in 1943 gave this type a poor start. A later transport was the Messerschmitt Me-243. Powered by four 1,700 horsepower Mercedes-Benz DB-603 liquid-cooled inverted Vee in-line motors, the Me-243 could serve as both a bomber and a transport. The Junkers Ju-90, with a characteristic swept-back wing, powered by four 1,600-horsepower BMW engines, had a gross weight of 55,000 pounds. A later version was the Junkers Ju-290, powered by four 1,000 horsepower Bramo-Fafnir engines. A still heavier plane was the Blohm & Voss Bv-222, powered by four 1,000 horsepower BMW engines and having a gross weight of 100,000 pounds. New developments included the four-motor Heinkel He-274. Finally, the Focke-Wulf Fw-200B, converted from the distinguished commercial Condor, offered excellent military transport service. As a troop-carrier, the Fw-200B had accommodation for thirty fully armed men. In 1945, the Arado Ar 232 appeared as a prototype. This high wing cargo plane was driven by two 1,600-horsepower BMW radial motors. The new plane could carry a load of 6,000 pounds.

Japanese Types. By 1945, the revision of Japanese aircraft design, which had begun in 1942, had greatly increased the striking power of the Japanese air forces. Japanese planes were now better armored, contained self-sealing tanks and carried heavier gun batteries. These improvements, however, failed to keep pace with the extensive de-

velopment of American planes. This inferiority partly accounted for the fact that Japan lost a total of 51,109 airplanes during the war and had only 15,886 planes at the time of surrender.

Conspicuous among the new Army fighters of Japan in 1945 was the Nakajima Ki84 Type 4, called by American pilots, the Frank I. This low wing monoplane was fitted with a 2,000 horsepower Nakajima Ha45 eighteen-cylinder radial motor and an electrically operated four-blade propeller. It had a top speed of 420 miles per hour at an altitude of 20,000 feet. It could climb at the rate of 5,000 feet per hour and had a service ceiling of 35,000 feet. Armament included two 20-millimeter cannon, mounted in the wings and two 12.7-millimeter machine guns on the cowl. The pilot was protected by effective armor. A bomb or fuel tank could be carried beneath each wing. Nick I, the Kawasaki Type 2Ki 45, was widely used on all battlefronts in 1945 by the Japanese Army as a day-and-night fighter. Its power plant consisted of two 1,020 horsepower Nakajima Type 2 radial motors which gave the plane a maximum speed of 351 miles per hour at an altitude of 17,600 feet. Armament included one 37-millimeter cannon under the starboard fuselage and three machine guns. Two 550 pound bombs could also be carried. The G4M4 or Betty 24 was a later version of the Mitsubishi Type 1 land-attack airplane. It was fitted with two 1,900 horsepower Kasei 25 radial motors. The year 1945 also saw considerable use of Jill 12, the Nakajima B6N12 which replaced the older Kate (Jill 11). Called *Tenzan* (Heavenly Mountain) by the Japanese, this three-seat carrier-borne attack plane was used for reconnaissance and torpedo bombing. Powered by a 1,900 horsepower Kasei 25-cylinder radial motor driving a four-bladed propeller, the Jill 12 had a maximum speed of 310 miles per hour at an altitude of 19,000 feet.

George II was a barrel-shaped mid-wing land-based navy fighter, resembling the American Republic Thunderbolt. It was powered by a 2,000 horsepower Homare 21 engine turning a four-bladed electric propeller. The engine was fitted with water injection device with an ejector without exhaust stacks. Maximum speed was over 400 miles per hour. Wing span was 39 feet and length, 29 feet. Its heavy armament included four 20-millimeter cannon in the wings and two 12.7-millimeter nose machine guns. The Japanese name for this plane was *Shiden* (Violet Lightning).

Kawanishi Norm II was a two-seat single-float seaplane used for reconnaissance. The Japanese name was *Shun* (Painted Cloud). This all-metal craft had a wing span of 46 feet and a length of 37 feet. Powered by a 1,720 horsepower Mitsubishi Kasei 24 radial engine, the Norm II had several new features including a contra-rotating propeller and a large stream-lined spinner covering the entire front of the engine cowl. The Norm also had ejector-type exhaust stacks and large wide-cord flaps. The wing floats were fully retractable.

The Kawanishi Rex II was a single-seat single-float fighter, called by the Japanese *Kyofu* (Mighty Wind). Powered by a 2,000 horsepower Nakajima Homare eighteen-cylinder radial engine, the Rex had a top speed of 400 miles per hour. Wing floats were retractable but did not fold flush with the wing's undersurface as on the Norm. The span was 40 feet and the length, 35 feet. Judy 33 was the latest model of the standard carrier based bomber. Its new power plant was a Mitsubishi Kinsei 62 radial engine. The wing span was 38 feet and the length, 34 feet. Retractable spoiler type dive

flaps were fitted to the undersurfaces of the wings. Top speed was 300 miles per hour. The crew number two.

A new reconnaissance bomber was the Peggy I. Powered by two radial engines, this plane had full feathering propellers. Wing span was 74 feet and length, 61 feet. The top speed was 345 miles per hour at an altitude of 20,000 feet. In one version of this mid-wing plane, a plywood-covered nose and tail cone fitted with radar was used for reconnaissance and search. Another version had conventional transparent nose and tail piece for bombing operations. The craft had a hydraulically operated power turret with a 20-millimeter cannon and waist blister with machine guns. Superseding the Mitsubishi Sally, the Nakajima Type 100 Model 2, called by Americans "Helen" was a seven-seat medium bomber, with a maximum speed of 299 miles per hour at an elevation of 19,700 feet.

American Commercial Types. The end of the hostilities of World War II brought emphasis upon new American commercial aircraft as distinct from Army transport planes. Commercial transports in 1945 were divided into two categories, namely: (1) four-motored long-range planes carrying 44 or more passengers and making stops not oftener than every 500 miles, and (2) twin-engined short-range transports with a seating capacity under 44 passengers, designed for economical operations at station intervals of 100 to 500 miles. In addition to these basic categories there were two special types of commercial planes, namely: (1) small single or twin-motored airplanes for feeder line operation, and (2) giant flying boats for trans-oceanic flights.

One of the outstanding civilian models is the Douglas DC-4, the commercial version of Army C-54 (Skymaster). This low-wing monoplane carries 44 passengers and a crew of five. It has a wing span of 117 feet, a length of 93, and an over-all height of 27. Powered by four Pratt & Whitney 2SD1-G engines, the Skymaster has a cruising speed of 252 miles per hour at an altitude of 23,000 feet, with a range of 4,240 miles. It has a gross take-off weight of 73,000 pounds. The DC-6 is a more luxurious airliner. Carrying a crew of five, it is designed to transport 52 passengers as a day plane and 26 berth passengers by night. It has a wing span of 117 feet, a length of 100, and a height of 28. Four Pratt & Whitney 2SC14-G engines drive Curtiss electric reversible propellers, 13 feet in diameter. The cruising speed is 315 miles per hour at an altitude of 24,000 feet with a load of 71,000 pounds. The maximum take off load is 91,200 pounds; while the maximum range is 4,100 miles. The Douglas DC-7 is in process of construction. This super-transport is the commercial version of the mammoth C-74 (Globemaster) delivered to the Army in 1945. With a crew of thirteen, it carries 96 passengers. The Globemaster has a wing span of 173 feet, a length of 124, and an over-all height of 43. Its gross weight is 162,000 pounds and the payload is 31 tons. The Globemaster is powered by four 3,000 horsepower R-4360 Pratt & Whitney Wasp Major engines, turning four-bladed Curtiss electric reversible propellers. A new development is the combination aileron and flap arrangement which keeps landing speeds below 95 miles per hour. This luxury airliner claims a long-range cruising speed of 285 miles per hour at an altitude of 20,000 feet. The maximum range is 7,800 miles. Twenty-six of these were ordered by the Pan American World Airways for their global routes.

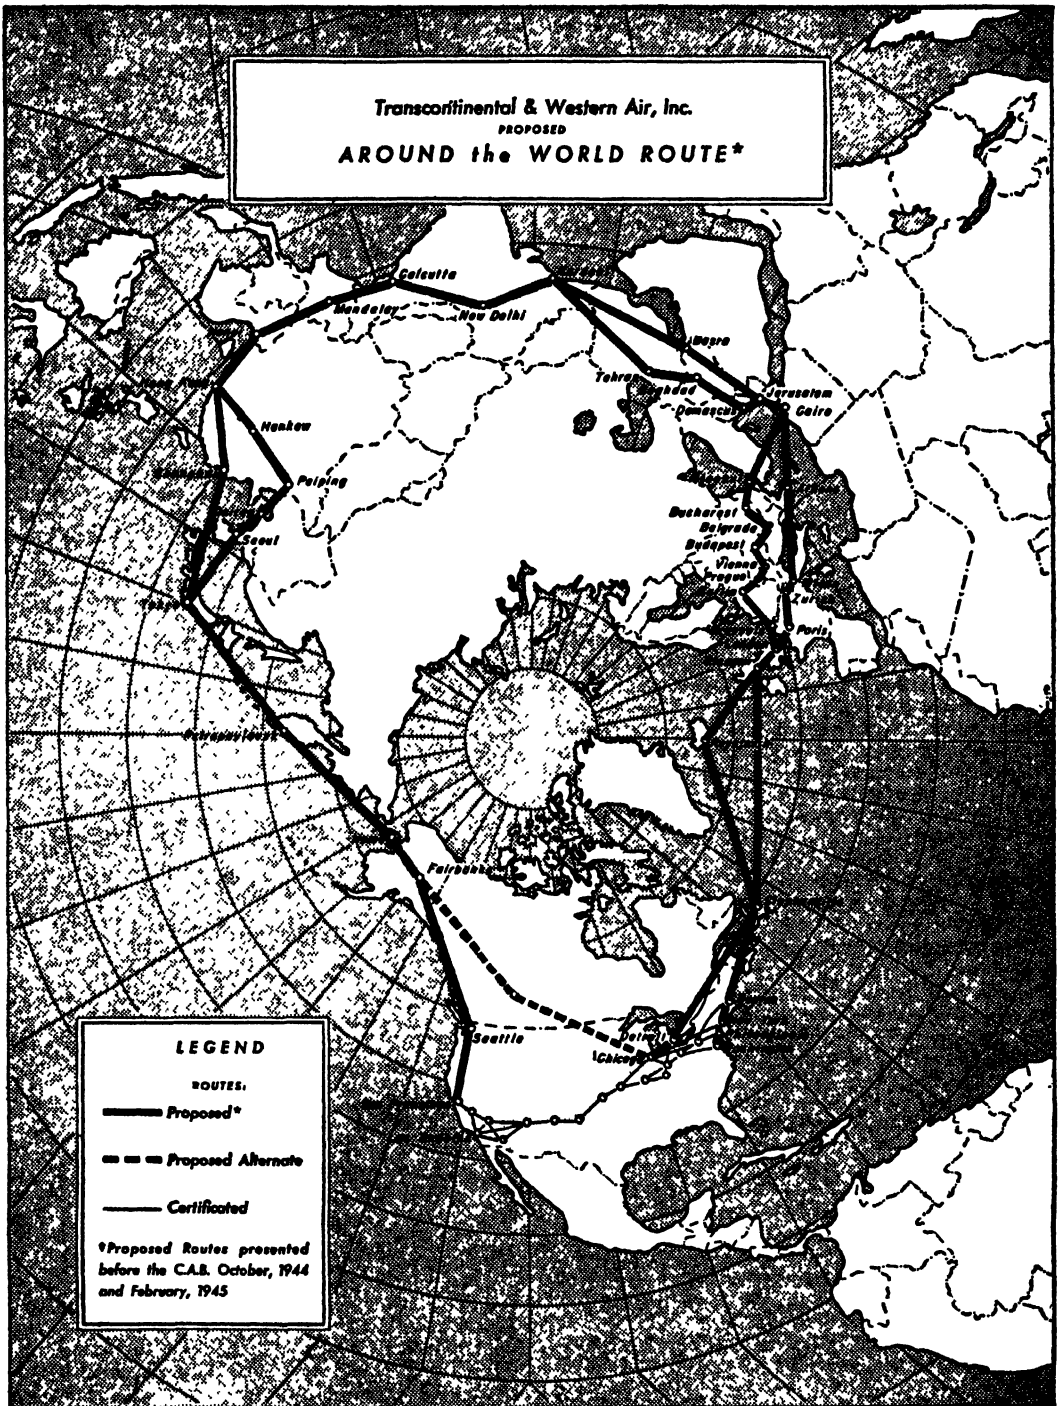

One of the outstanding developments of 1945

was the Boeing 377 (Stratocruiser), the commercial counterpart of the Boeing C-97, which in turn is the military transport version of the Superfortress. This new four-engine, low-wing, two-deck, pressurized cabin, passenger plane has a wingspan of 141 feet, a length of 110, and an over-all height of 38. With a gross weight of 135,000 pounds, the plane is powered by four Pratt & Whitney R-4360 Wasp Major engines of 3,500 horsepower each at the take-off. It has a cruising speed of 340 miles per hour, a range of 4,200 miles and an operating altitude of 30,000 feet. The three-bladed propellers are 16 feet and 6 inches in diameter. The crew is 5 to 7 in number. The Stratocruiser carries 114 passengers in seats, or 60 in berths. Pan American World Airways purchased 20 Stratocruisers for nonstop flights between New York and London in 11½ hours.

Another contestant among the long-range giant airliners is the Lockheed Constellation. This all-metal, low-wing monoplane carries 64 passengers and a crew of five. The power plant is four Wright Cyclones, each of 2,200 horsepower, which drive Hamilton Standard super-hydromatic propellers, 15 feet in diameter. Developing a top speed of 350 miles per hour with full load, the Constellation has a cruising speed of 310 miles per hour, a nonstop range of over 5,000 miles and a service ceiling of over 25,000 feet. It has a maximum take off gross weight of 100,000 pounds and a payload of 24 tons. The wing span is 123 feet; the length, 95, the over-all height, 23. A pressurized cabin maintains an 8,000-foot atmosphere at a 20,000-foot altitude. Its nonstop flights from New York to London and from Los Angeles to Honolulu have given outstanding performance, for its ability to cruise "above the weather" permits the avoidance of most storms. It is used on numerous airlines including the American Export Airlines, the Eastern Airlines, the French Government Airlines, KLM Royal Dutch Airlines, KNILM Royal Netherlands Indies Airlines, Pan American World Airways, Pan American Grace Airways and Transcontinental and Western Air.

The Fairchild C-82 Packet is a new development in the way of air freight. This giant plane offers 2,870 cubic feet of space, actually greater than many railroad boxcars. Moreover, a provision for end-loading eliminates the 90-degree turn involved in side loading and thus accommodates a longer cargo than the conventional transport plane. The empty weight of the C-82 is 28,000 pounds, and the useful load, 22,000 pounds. The maximum payload for 500 miles is 18,000 pounds; for 1,000 miles, 15,500; and for 1,500 miles, 13,000. Power-plant includes two Pratt & Whitney R-2800C twin-row radial air-cooled engines, each of 2,100 horsepower at the take-off. Cruising speed is 200 miles per hour and maximum range 4,000 miles. The fuselage of the Packet is 54 feet long, 10 wide and 13 high. One engine is mounted in each wing. Aft of each engine a boom extends to the tail, composed of a cross piece and two rudders.

In the field of short-range carriers, the Martin 202 has set a high standard. This all-metal, low-wing monoplane has a passenger capacity of 30, a crew of 5 and a useful load of 10,976 pounds. It gives fast and low-cost travel over ranges of 100 to 700 miles where larger four-engined transports cannot be operated with profit. With a wing span of 92 feet, this luxury airliner is powered by two Pratt & Whitney WR-2800-2SC15C engines each with 2,400 horsepower in the take-off. The cruising speed is 270 miles per hour and the top speed, 306.

THE FIRST PROPOSED AROUND-THE-WORLD ROUTE

The maximum operational ceiling is 30,000 feet. Another recent type is the Douglas DC-8, designed as a replacement for the well-known DC-3. This low-wing monoplane, grossing 39,500 pounds, carries a useful load of 15,585 pounds and accommodates 38 to 48 passengers. The wing span is 110 feet; the length, 77; the over-all height, 25. The

distinctive feature is the location of the two propellers in tandem fashion behind the rudder. These propellers, fifteen feet in diameter, are powered by two Allison V-1710 engines of 1,600 horsepower. The maximum cruising speed is 270 miles per hour. The operating cost per-passenger-mile is one-half that of the DC-3.

Among flying boats, the Mars, built by the Glenn L. Martin Company for the Navy, has remained the world's largest aircraft of this character. This is a 72-ton plane with a wing span of 200 feet. Its records include the longest nonstop flight, from Patuxent, Maryland, to Natal in Brazil, a hop of 4,475 miles. It has lifted the heaviest load ever carried by an airplane, 148,500 pounds, at the take-off, and has carried the heaviest payload on the longest flight, namely, 35,000 pounds between Pearl Harbor and Alameda, California, a distance of 2,500 miles.

British Commercial Types. The year saw the completion of the Avro Lancaster G-AGLF, a luxury airliner in extensive use on long routes by the British Overseas Airways and the Trans-Canadian Air Lines. With a wing span of 102 feet, a length of 76 and an over-all height of 19, the Avro Lancaster has a gross weight of 65,000 pounds. The crew numbers five, while the plane is equipped with berths for nine passengers. The most economical cruising speed is 200 miles per hour, using 575 horsepower from each of the 1,250 horsepower Rolls-Royce Merlin motors at an altitude of 15,000 feet. High-speed cruising reaches 265 miles per hour. The Lancaster has seats facing sideways with passengers looking toward windows on the sides of the cabin. The Avro York I, a four-engined airliner with a wing span of 102 feet, is designed for 24 passengers and a crew of four. With a high speed around 300 miles per hour, it has a range of 3,000 miles. The Avro Tudor, which took to the air in 1945, is Britain's first pressurized airliner. With a wing span of 120 feet, the Avro 688 is powered by four 1,850 horsepower Merlin engines. The maximum speed is 346 miles and the normal cruising speed, 300. The range is 4,890 miles. The maximum take-off gross weight is 76,000 pounds. The crew is five and the passengers with sleeping accommodations are twelve in number. Seats in this luxury liner are grouped into compartments. Equipment includes a kitchen and a steward's pantry.

The Airspeed Ambassador AS-57, designed to replace the Douglas DC-3 on British airways, has a pressurized cabin with seats for 36 passengers. It operates over stage distances of 200 to 800 miles; and, with only 25 passengers, over distances of 1,300. Its wing span is 115 feet; length 80; over-all height 19. Power is supplied by two Centaurus-57 engines. Cruising speed is 210 miles. Another new airliner, the Miles M-56, carries 24 passengers. Wing span 80 feet, length 66. Powered by two Rolls-Royce Merlin engines, the Miles M-56 has a cruising speed of 226 miles, and a range of 1,600. The Vickers-Armstrong VC-1 Viking is another 21 to 27 passenger airliner developed to replace the Douglas DC-3. In the larger group of airliners, the Bristol 167 is under development as a 100-ton passenger plane designed for trans-Atlantic work.

The largest British plane to take to the air was the Short S-35 Shetland. This flying boat, as a civilian plane, holds 70 passengers. With a wing span of 150 feet and a length of 110, it has an over-all height of 39. Having an empty weight of 75,855 pounds, it can carry a gross weight of 130,000. The payload is 7,620 pounds for a flight of 4,650 miles; 22,000 pounds for 3,000 miles; and 30,025 pounds for 2,076. The maximum speed is 267 miles at an altitude of 4,000 feet. The plane is propelled by four 2,500 horsepower Bristol Centaurus air-cooled eighteen-cylinder sleeve-valve two-row radial motors.

Helicopters. The year saw several developments in the helicopter, the flying machine in which the lifting force is the upward pull of one or more propellers revolving horizontally. The only helicopters produced in quantity are the Sikorsky R-4, the R-5 and the R-6. The R-5 is powered by a Pratt & Whitney R-985 Wasp Junior engine of 450 horsepower. The R-6 has a Franklin 230 horsepower engine. On the battle front in World War II, the Sikorsky R-4 proved effective in carrying serum and medicine to isolated ships and outposts, and in rescuing American wounded soldiers in the jungle.

The A-3, produced in 1945 by the Aeronautical Products Company, of Detroit, Michigan, is a single-rotor ship similar in appearance to a conventional light plane, except that the propeller is above the cabin and revolves horizontally. The power plant is a Franklin 6-cylinder air-cooled engine.

Flight tests of the PV-3 Helicopter in 1945 proved its serviceability to fulfill Coast Guard and Navy air-sea rescue. The PV-3, manufactured by the P-V Engineering Forum, is powered by a single Continental-Wright R-975 engine with a rating of 450 horsepower at the take off. The engine is entirely closed and furnishes power to each of the rotors (propellers) at each end of the fuselage which is 48 feet long and 13 feet high. The unique feature of the design is the tandem arrangement of the rotors, each propeller rotating in opposite direction in order to eliminate torque effects. The pilot's cabin is almost under the forward rotor, passenger quarters directly behind the pilot. Gross weight of the PV-3 is 6,500 pounds. The plane can land within a circle of 100 feet diameter.

Air Transport Command. The Air Transport Command, operating under the U. S. Army Air Forces, continued its extensive service even after V-J Day. In September it was operating a total of 2,860 major transport planes, a fleet eight times the size of all the domestic airlines in the United States. Its air routes covered every continent of the globe and crossed every ocean. Chief among these transports were the Curtiss C-46 (Commando), the Douglas C-47 (Skytrain), the C-54 (Skymaster), the Lockheed C-69 (Constellation), the Fairchild C-82 (Packet), the Boeing C-97 and the Consolidated C-87. The North Atlantic routes of the ATC originated at New York, Washington, Stephenville in Newfoundland and Goose Bay in Labrador. The principal European terminus was Prestwick in Scotland. Other terminals were Paris and Casablanca by way of the Azores. In speeding the war effort and demobilization, this global military airline carried almost 4,000,000 passengers, of which more than 325,000 were sick and wounded. The corresponding service for the Navy is the Naval Air Transport Command.

Domestic Air Carriers. On Oct. 17, 1945, Army priorities on all civil air transportation, except across the Pacific Ocean, were lifted. Passengers with tickets no longer had to fear being "bumped" off a plane before reaching their destination. Although the domestic air lines were supplied with numerous C-54s which had been declared surplus by the Army, these public carriers were still unable to meet the heavy demand for air travel. Pending the delivery of new commercial planes and the expansion of schedules, airliners made capacity flights on almost all routes.

The heavy increase in air travel after V-J Day is not reflected in statistics for the year, inasmuch as the U. S. Civil Aeronautics Board follows the fiscal year of the U. S. Government which begins

on the first of July. In the year of June 30, 1944, to June 30, 1945, when the airlines were still under contract to the Army, all domestic air mail carriers flew a total of 186,244,384 miles as compared to 120,996,373 miles in 1944. Of these, 179,703,872 were revenue miles flown in 1945 and 117,389,242 revenue miles in 1944.

The number of revenue passengers carried was 5,137,877, compared with 3,309,696 in 1944. The average length of journey was 550.9 miles against 554.5. The pounds of mail carried were 184,520,818—132,439,684 in 1944. The express poundage was 91,992,032 as compared with 67,060,698; while the excess baggage reached 15,982,424 pounds against 11,969,838. The average total mileage per multi-motored aircraft was 1,780.5; 1,641.0 in 1944; while the mileage per single-motored aircraft was 274.9 as compared with 208.6.

The total number of accidents of public aircraft carriers operating in the United States for the year 1945 was 40, including 8 fatal accidents. The passenger fatalities were 76 and the pilot and crew fatalities, 12. The total revenue passenger miles for the year 1945 was 3,507,175,048; with the result that the revenue miles per passenger fatality was 46,147,040.

The operating revenue of American domestic air carriers in 1945 was: passengers, \$142,475,404; express and freight, \$10,704,885; excess baggage, \$2,257,092; charter flights, \$63,539; and other revenue, \$819,256; making a total non-mail revenue of \$156,326,177. The mail revenue was \$36,929,204. Thus, the total operating revenue was \$193,249,381. Corresponding figures for the year 1944 were: passenger fares, \$95,428,516; express and freight, \$7,753,614; excess baggage, \$1,816,942; charter flights, \$7,623; other revenue, \$1,003,475; making a total of non-mail revenue of \$106,010,172. Mail revenue in 1944 was \$27,948,133, giving a total of \$133,958,305. Total operating expenses in 1945 were \$148,744,071 as compared with \$107,312,054 in 1944. The net operating income was \$44,505,310 against \$26,646,250. Income taxes in 1945, minus non-operating income, amounted to \$21,391,713—\$14,923,208 in 1944. As a result, the net profit of domestic carriers was \$21,391,713 as compared with \$14,923,208 the previous year. The stockholders' equity or net worth of all domestic airlines was \$131,747,695, against \$102,430,240 in 1945.

International American Air Carriers. The following American air carriers possessed scheduled flights to foreign countries from terminal points within the United States in the year 1945: the Northeast Airlines, which served New Brunswick; the Colonial Airlines, which served Canada; the Northwest Airlines, also serving Canada; the United Airlines, also serving Canada; the American Airlines, which served Mexico; and the Western Air Lines which served Canada. American air carriers whose entire operations were international included the Pan American Airways, Panagra, Trans-World Airways (TWA) and the American Overseas Airlines. The latter carrier took control of the American Export Airlines, which had operated during the war under contract to the military services as the American Export. In July, 1945, the Civil Aeronautics Board granted certificates for North Atlantic routes to the American Overseas Airlines and the Transcontinental and Western Air. Pan American Airways also possessed a North Atlantic route. Statistics for international air traffic in 1945 do not include these three routes inasmuch as the reports from the Civil Aeronautics Board cover each year ending June 30.

In the year 1945, American carriers engaged in international traffic flew 25,293,704 pay-mail miles for the United States, 189,472 pay-mail miles for foreign countries, and 811,438 other revenue miles, making a total of 26,294,614 revenue miles as compared with 19,643,136 in the year 1944. The number of non-revenue miles flown was 2,402,184, making a total of 28,696,798 miles flown in foreign and overseas flights. Traffic passenger statistics showed 384,716 revenue passengers carried as compared with 306,349 in the year 1944. The available seat-miles were 471,247,164, the revenue passenger miles were 367,661,947 and the average passenger fare was 8.01 cents per mile. As to cargo traffic, American planes carried 3,187,141 pounds of United States mail, 1,167,084 pounds of foreign mail, 13,045,444 pounds of express, and 3,483,054 pounds of excess baggage. Operating revenues showed \$29,464,600 from passenger revenue, \$6,121,935 from express revenue, \$1,241,331 from excess baggage revenue, \$2,262,932 from other revenue, and \$7,904,062 from mail revenue, making a total of \$46,984,860 as compared with \$37,795,309 in the year 1944. The net operating loss was \$2,608,567 as compared with a profit of \$2,556,731 in the year 1944.

Safety Statistics. Of the 4,438 accidents reported by the Civil Aeronautics Board in the year 1945, only 177 concerned air-carriers and 4,261 involved planes not engaged in public transportation. In a total of 179,703,872 revenue miles flown, there were 48 major and minor accidents, and 7 fatal accidents. In other words, there was one accident for every 3,743,830 miles flown and one fatal accident for every 25,671,982 miles flown. This record compared unfavorably with the year 1940 when there were no fatal accidents, and favorably with the year 1937 when there were 7 fatal accidents. In 1937, there was one major or minor accident for every 1,224,646 miles flown, and one fatal accident for every 9,247,471 miles flown. The number of passenger fatalities in 1945 was 80; of pilot fatalities, 7; and of crew fatalities, 8, making a total of 95 fatalities. The total number of revenue passenger miles flown was 2,830,597,814; the revenue passengers carried was 5,137,877; and the percent of passengers fatally injured was 0.0016. The number of passenger miles flown per passenger fatality was 35,382,473; while the number of passenger fatalities per 100 million passenger miles was 2.8.

Civil Aeronautics Administration. The Civil Aeronautics Administration conducted 28,987 aircraft inspections for airworthiness, including originals, renewals and inspections after repair or alteration. The CAA granted type approvals for 35 aircraft, 50 aeronautical engines, 154 propellers and 51 appliances. It conducted 346 flying school and 237 ground school inspections, and gave 1,626 written examinations for airline transport pilot certificates. Civil Air Regulations require that every holder of a Federal pilot certificate must have a physical examination every six months if he is to keep his rating active. The Medical Service of the Civil Aeronautics Administration gave 9,200 physical examinations.

International Air Traffic. The year witnessed a continuation of the controversy over the "chosen instrument." Pan American Airways led the support of the McCarran Bill pending in Congress which would limit all American participation in foreign air traffic to one company—the "chosen instrument." The seventeen American companies which had in 1944 entered protest against the proposal of a "chosen instrument" continued their

opposition. In support of the proposed monopoly it was said that unlimited American competition would lead to competing flights with planes flying at half or less than half capacity. At the same time, the duplication of services would waste the resources of the competing companies and drive them into bankruptcy. Defenders of the policy also pointed to the fact that Great Britain relied upon the "chosen instrument" when granting a monopoly in foreign air traffic to the British Overseas Airways Corporation, while other European powers had followed the same policy before World War II and would resume this policy in the postwar period. In opposition, the seventeen airlines called attention to the dangers of stifling competition, the pitfalls of wasteful duplication of services could be avoided, they said, by agreements between competing companies and by proper support on the part of the State Department.

In March, the Department of Justice rendered an opinion opposing single-company operation of international air traffic under the American flag. Attorney-General Biddle recommended: (1) adoption of a "controlled competition" policy, (2) negotiation of an international understanding which would define and limit governmental financial subsidies for inter-country lines; (3) formation of an international organization to analyze carrier operations and regulations and to serve as a world problem-solving medium; and (4) encouragement of economic and legal conditions promoting continued private operation of America's international air carriers. In case private operation of international airlines proved to be profitless, the Attorney-General hinted that governmental operation of an international airline under the American flag might become necessary. "Controlled competition" was proposed as a compromise between monopoly and cut-throat competition. "Controlled competition" might assign alternative routes, within specified geographic zones, to competing companies.

In July, the Civil Aeronautics Board, following the policy of "controlled competition," authorized three American airlines to operate routes over the North Atlantic Ocean. These were Pan American Airways, American Overseas Airline, and Transcontinental and Western Air. This arrangement was protested by Pan American Airways on the ground that whereas its European terminal was restricted to Foynes in Ireland, the two other American companies were allowed to reach many European cities like Paris, and even Africa.

In July, the British Overseas Airways Corporation resumed commercial flights at least once weekly between America and England, using Boeing 314's. In October, the Pan American Airways and the American Overseas Airline began operation of their transatlantic schedules with respectively two and three trips a week. The Pan American Airways expected its quota to be raised to three trips a week through agreement between the State Department and the British Government. The flights were made with Douglas C-54s, which had been purchased as surplus from the Government and converted into commercial airliners at a cost of about \$150,000 each. Crews of seven manned the planes which carried an average of forty-four passengers. The planes cruised at about 211 miles per hour at an altitude of 10,000 feet. Both planes and the route flown to England were familiar to the crews, who had flown similar craft over the same route during the war, under the contracts of the American airlines with the Air Transport Command.

In October, Pan American startled the aviation world by applying to the Civil Aeronautics Board for permission immediately to cut the prewar fare from New York to London from \$525 to \$275, with a round trip rate of \$495. Permission was denied upon the ground that an immediate cut would not allow competitors to take appropriate measures. When, after the thirty-day period required by the CAB had expired and the Pan American Airways had reduced its rates, the British Government objected to such reckless slashing of rates and ordered a cut-back to two flights per week, with a proviso that no more than 500 passengers be carried each week. Inasmuch as the British Overseas Airways Corporation operated only three old Boeing Clippers on the North Atlantic route, with about twenty passengers a week, it was obvious that the British Government had dealt more generously with the American airlines than the principle of reciprocity demanded. Eventually a compromise fare of \$375 proposed by the Air Transport Association was accepted.

Air Transport Association. The Air Traffic Association, founded in 1919, was a private international organization of airlines for the purpose of investigating the operation of airlines, including rates and schedules. Its work was interrupted by World War II. It was revived under the name of the Air Transport Association and its seat located at Montreal in Canada. Seventeen American airlines joined the reorganized association.

International Air Conferences. In August, the first session of the Interim Council of the Provisional International Civil Aviation Organization was held in Montreal. The PICAIO is the temporary organization established by the Interim Agreement on International Civil Aviation, adopted by the International Air Conference held in Chicago in 1944. On June 6, when the Interim Agreement came into force, 36 states had accepted the agreement. Twenty states, elected at the Chicago Conference, were represented at the Montreal session. The organization is of a technical and advisory nature and is not empowered to regulate the economic phases of international air traffic.

The Chicago Air Conference had offered two general air agreements for the ratification of all interested states. The Transit or Two Freedoms Agreement binds signatory states to grant the privilege of transit and non-traffic stops to the planes of all other signatory states. The Transport or Five Freedoms Agreement includes not only the two freedoms just mentioned but also: (1) the privilege to discharge passengers, mail and freight received in the state whose flag the aircraft carries; (2) the privilege to take on passengers, mail and cargo bound for the state whose flag the aircraft carries; and (3) the privilege to take on passengers, mail and cargo destined for the territory of any other contracting state as well as the privilege to put down passengers, mail and cargo from any such territory. By the end of the year twenty-three countries, including Great Britain, the United States, Canada and Belgium had signed the Two Freedoms Agreement. Only eleven countries signed and ratified the Five Freedoms Agreement. While the United States accepted the two agreements, Great Britain declined to be a party to them. Soviet Russia, which had refused to appear in the Chicago Air Traffic Conference, likewise failed to adhere to any of the agreements.

Aeronautical Records. During the year several previous records of performance by aircraft were broken, although in some cases lack of a witness from the National Aeronautical Association barred

official recognition. On December 11, a new transcontinental speed record was chalked up when a B-29 piloted by Col. Clarence S. Irvine and Lt. Col. G. R. Stanley made a 2,464-mile flight from Burbank in California to Floyd Bennett Field in Brooklyn in 5 hours, 27 minutes and 8 seconds. In October, a British Gloster Meteor, a twin jet airplane, exceeded 640 miles an hour over a measured course in England. In August, Brig. Gen. Lawrence G. Fritz piloted an Army Transport Command C-69 from New York to Paris, a distance of 3,600 miles, in 14 hours and 12 minutes, to break the previous non-stop record of 18 hours. In June, the War Department disclosed the fact that Maj. Gen. Curtis E. LeMay had made a record non-stop flight from Hawaii to Washington in a B-29 Superfortress, covering 4,640 miles in 20 hours and 15 minutes.

Bibliography. Among the books on domestic and international aviation published in 1945 were: John Paul Andrews, *Your Personal Plane* (New York); James F. Chamberlain, *Air-Age Geography and Society* (Philadelphia); Rowland W. Fixel, *The Law of Aviation* (2d ed., Charlottesville, Virginia); Glen A. Gilbert, *Air Traffic Control* (Chicago); Alice Rogers Hager, *Wings for the Dragon* (New York); Fred G. Kelly, *The Wright Brothers* (London); Lester Ott, *The Standard Guide to Private Planes* (New York); Carleton Putnam, *High Journey* (New York); John Sebastian, *Air Traffic Control* (Chicago); O. N. Shawcross and K. R. Beaumont, *Air Law* (London); Eugene E. Wilson, *Air Power for Peace* (New York); H. E. Wimperis, *Aviation* (Oxford).

Books on aerial warfare included: Keith Ayling, *Old Leatherface of the Flying Tigers* (Indianapolis), a biography of Maj. Gen. Claire Le Chennault; Lowell Bennett, *Parachute to Berlin* (New York); Major C. G. Power, *The R.O.A.F. Overseas* (London); Lt. Comdr. J. Bryan and Philip Reed, *Mission Beyond Darkness* (New York), the account of a carrier attack in the Philippines; Hugh B. Cave, *Wings Across the World: The Story of the Air Transport Command* (New York); Thomas F. Collison, *The Superfortress is Born* (New York); James Forrestal, *Our Flying Navy* (New York); Eric Friedheim and Samuel W. Taylor, *Fighters Up* (Philadelphia); Gessner G. Hawley and Sigmund W. Leifson, *Atomic Energy in War and Peace* (New York); Rom Landau, *The Wing* (London); G. Edward Pendray, *The Coming Age of Rocket Power* (New York); Carleton Putnam, *High Journey* (New York).

Among the numerous textbooks on air navigation were the following: *Air Navigation: Contact Flying* (McGraw-Hill Book Co. series, New York); Charles Mattingly, *American Air Navigation* (San Diego); Sqd. Ldr. R. Hadingham, *Astronomical Air Navigation* (2d ed., London); Terence Horsley, *Soaring Flight* (London); Richard von Mises, *Theory of Flight* (New York); Robert W. Mudge, *Meteorology for Pilots* (New York); Henry W. Roberts, *Aviation Radio* (New York).

Aeronautical engineering produced a large crop of books including: Zygmunt Fombert, *Theory and Testing of Jet Propulsion Motors and Rockets* (New York); Joseph H. Keenan and Joseph Kaye, *Thermodynamic Properties of Air* (New York); R. G. Manley, *Waveform Analysis* (London); O. L. Morris, *Pioneering the Helicopter* (New York); Alexander A. Nikolsky, *Notes on Helicopter Design* (Princeton); G. Geoffrey Smith, *Gas Turbines and Jet Propulsion for Aircraft* (New York); James E. Thompson, *Aircraft Production Design* (San Carlos, California); Herbert S. Zim, *Rockets and Jets* (New York).

Aeronautical yearbooks included: *Jane's All the World's Aircraft, 1948-1944*, ed. by Leonard Bridgman (London); *Aviation Annual of 1946*, ed. by Reginald M. Cleveland and Frederick P. Graham (New York); *Aviation Facts and Figures, 1945*, ed. by Rudolf Modley (New York); *The Airman's Almanac, 1945*, ed. by Francis Walton (New York); *The Aircraft Year Book, 1945*, ed. by Howard Mingos; *The Aircraft Annual, 1945*, ed. by David O. Cooke (New York).

Among publications of the United States Government were: *Annual Airline Statistics: Domestic Carriers: Calendar Year 1945* published by the Civil Aeronautics Board; and *Civil Aviation and the National Economy* published by the Office of Aviation Information of the Civil Aeronautics Administration. The final report of General H. H. Arnold on American air power in World War II was published on November 12, 1945, as *Third Report of the Commanding General of the Army Air Forces to the Secretary of War*. On September 30, 1945, was issued *The United States Strategic Bombing Survey: Over-all Report: European War*. On the same day, a *Summary Report* was released. The final report of Gen-

eral George C. Marshall, published on September 1, 1945, as *Biennial Report of the Chief of Staff of the United States Army, July 1, 1943, to June 30, 1945*, to the Secretary of War, gives attention to air power in the strategy of World War II. Regarding aircraft as surplus, see the *Quarterly Progress Report of the Surplus Property Board to Congress*. The U. S. Department of State published *International Civil Aviation Conference, Chicago, 1944: Final Act and Related Documents*. Among publications of the British Government were *International Civil Aviation Conference, 1944* (Cmd. 6614); *Civil Aviation Communications Handbook: British Air Transport* (Cmd. 6805); *Ocean Front: The Story of the War in the Pacific, 1941-1944*.

KENNETH COLEGROVE.

AFGHANISTAN. A kingdom in central Asia. Area: 251,000 square miles. Population, according to the latest estimate, 12,000,000. Chief towns: Kabul (capital) 120,000 inhabitants, Kandahar 80,000 (including suburbs), Herat 85,000, Mazar-i-Sharif 30,000. The languages spoken are Persian, Pashto, and Turki. Most of the inhabitants are Moslems of the Sunni sect; others are Moslems of the Shiite (Shiah) sect. Primary and secondary education are free.

Production. Agriculture and stock raising are the chief occupations, the main products being cereals, fruits, vegetables, cotton, wool, hides and skins, and meat from the native fat-tailed sheep. The mineral resources include iron, copper, lead, gold, silver, lapis lazuli, coal, and petroleum, but there is little production. There are state-owned factories at Kabul, Kandahar, and elsewhere for the manufacture of arms, ammunition, boots, military clothing, furniture, matches, buttons, leather, soap, cotton goods, and wool products.

Foreign Trade. Commerce is mainly with India, the Soviet Union, and Iran. The chief exports are fruits, nuts, timber, spices, cotton, carpets, wool, and furs. Cotton textiles, machinery, gasoline, kerosene, sugar, motor vehicles, and tea are the main imports.

Communications. Afghanistan has no railways and practically no navigable rivers. Four thousand miles of roads are suitable for motor transport in dry weather, and trucks are increasingly replacing pack animals as the chief means of transportation. There is an all-weather motor highway from Kabul to Peshawar, India; a 500-mile motor route from Stalinabad, Soviet Turkestan, to Khorog on the Afghan border; and a trade route linking Kandahar to the Indian railhead at Chaman. Telephones are installed in most of the towns. Five radio stations serve the country and there is a radio installation which connects Kabul with Europe, the Far East, America, and other parts of the world.

Government. Under the Constitution of Oct. 31, 1931, Afghanistan is a constitutional monarchy, with legislative power vested in the King, a senate of 45 members nominated for life, and a national assembly of 109 elected members. Actually the state consists of a loose federation of warlike tribes under the patriarchal rule of the family controlling the government at Kabul. Through the influence of his uncle, Shah Mahmud, the Minister of War, Mohammed Zahir Shah succeeded to the throne after the assassination of his father, Mohammed Nadir Shah, in 1933 and remains the reigning King. King Nadir proclaimed a new constitution in 1932 under which slavery and forced labor were forbidden.

The People. The population is estimated at 12,000,000, all but a small proportion of whom are Moslems of the Sunni sect. Persian, Pashto and Turki are the principal languages. There are some 20,000 mullahs (priests) who wield great power, including the administration of justice and a large

measure of control over education. Primary education is compulsory. Schools in 1941 included 130 primary, 4 secondary and 3 military schools. A university was established in Kabul in 1932.

The Economy. The country is almost exclusively agricultural, with two harvests a year. The chief products are cereals, fruits, vegetables, cotton, wool, hides and skins, and meat from the native fat-tailed sheep. Commerce is mainly with the adjoining countries of Iran, the U.S.S.R. and India, to which agricultural and animal products, timber and cotton carpets are exported.

Afghanistan has no railways and few navigable river passages. The government has begun the building of motor roads to supplement or replace the traditional routes on which merchandise has been transported by camel and pony. The program for 1944 included the linking of Kabul with Khanabad and Faizabad with Badakhshan. Telephones are installed in most of the towns. Five radio stations serve the country and there is a radio installation which connects Kabul with Europe, the Far East, America and other parts of the world.

AFRICA. A continent of the eastern hemisphere. Area, about 11,710,000 square miles (30,830,000 square kilometers). Population (Jan. 1, 1940, estimate), 157,900,000. See the separate articles on its subdivisions, countries, and territories, such as ALGERIA, BRITISH CENTRAL AFRICA; BRITISH EAST AFRICA; BRITISH WEST AFRICA; EGYPT, ETHIOPIA, KENYA, MOROCCO, SOUTH AFRICA, UNION OF; TUNISIA.

AGENCIES, Government. The following government agencies and authorities were terminated on the date indicated: Electric Home and Farm Authority, Oct. 13, 1942; Committee for Congested Production Areas, Dec. 3, 1944; Coal Mines Administration, Aug. 16, 1944; Division of Central Administrative Services, Nov. 30, 1944; United States and Canada Joint Economic Committees, March 14, 1944; War Food Administration, June 30, 1945; War Public Works and Services, Aug. 14, 1945; Office of Distribution, Jan. 1, 1945.

AGRICULTURAL ADJUSTMENT AGENCY (AAA). An Agency of the U.S. Department of Agriculture, created as the Agricultural Adjustment Administration in 1933, incorporated into the War Food Administration, 1943, returned to the Department of Agriculture, June 29, 1945, and consolidated into Production and Marketing Administration (q.v.), August 18, 1945. Its program was directed primarily at adjusting national farm production to wartime needs, while encouraging practices which would increase yields and conserve soil resources. Wartime demands shifted emphasis placed on various phases of the AAA program. The program in 1944 and 1945 had three major phases:

1. Farmers were guided and assisted in producing up to national crop goals and in carrying out conservation measures which enable their land to contribute most to national farm production. Program payments were made only in connection with soil-and-water-conservation practices to increase present yields and maintain fertility for future production.

2. Marketing quotas were in effect for flue-cured and burley tobacco. (Available as a means of allocating the market among growers, marketing quotas, with penalties for excess marketings, may be used only when approved by two-thirds of the producers of a crop voting in referendum.)

3. The ever-normal granary, through which re-

serve stocks are held for emergency use, continued to be available through the Commodity Credit Corporation. The foundation of the granary is the commodity storage and loan program which AAA committees help to administer in the field.

In addition, the Agency was responsible for specific war food tasks such as encouraging farmers to sell corn to processors to keep war plants operating, rationing farm machinery, local assistance in administration of price-supporting measures, war crop loans, and feed and seed distribution. Chief: Norris E. Dodd.

AGRICULTURAL AND INDUSTRIAL CHEMISTRY, Bureau of. A Bureau of the U.S. Department of Agriculture, composed of two Bureaus originally created in 1901. It is a research organization engaged in investigations and experiments in the fields of chemistry, physics, and other physical sciences with the object of gaining new fundamental scientific knowledge relating to agriculture, improving agricultural methods, and developing new and wider industrial uses for agricultural products. The four regional laboratories for Research on Utilization of Farm Products conduct investigations to develop new and wider industrial uses for agricultural commodities. The Bureau's wartime research concentrated on food storage; food preservation, especially by dehydration; adaptation of lint cotton for nitration; treatment of cotton and cotton fabrics for special uses in wartime; and utilization of domestic agricultural materials as supplementary or substitute sources of products usually derived from foreign sources. Chief: O. E. May. See AGRICULTURE.

AGRICULTURAL COOPERATION. About half the farmers in the United States are members or patrons of farmers' cooperative associations. These groups pool their commodities to market them more effectively and also pool their purchasing power to get farm supplies and farm business services. Under such cooperative arrangements farmers provide for themselves business advantages similar to those obtained by industry through the use of pooled capital. As members of cooperatives, farmers themselves receive the savings effected by such joint action, usually in the form of patronage refunds; they get the grade of supplies required; they improve the quality of their own products; and in many instances, they provide themselves with needed business services otherwise not available to them.

History of farmer cooperatives in the United States goes back more than 100 years. "Associated or cooperative dairying" was attempted at Goshen, Connecticut, about 1810, according to the Handbook of Connecticut Agriculture issued in 1901. In the early days, farmers began to practice cooperation by log rollings, barn raisings, helping each other harvest crops, and many other acts of neighborliness.

By 1944 membership in farmers' marketing and purchasing cooperatives had grown to over four million, compared with a membership in 1915 of only a half million.

Farmers obtain both long-term mortgage credit and short-term operating loans cooperatively. About 370,000 are members of 1,754 National Farm Loan Associations through which Federal Land Bank mortgage loans are made, and 350,000 are members of 513 Production Credit Associations which supply them with operating credit.

Electric service reaches farms through the service of 800 Rural Electrification Cooperatives; 2,000

mutual fire insurance companies, 1,500 mutual irrigation companies, and 2,000 mutual telephone companies also provide farmer members with their specialized services.

During the past year at least four rural cooperative hospitals have been in operation. Groups in several other communities are going ahead with plans to build such hospitals when supplies can be obtained.

The marketing cooperatives started off the year 1945 with full war production. With the coming of peace, they found they would need to consider some changes, particularly new markets, since their ready-made outlet to Government for war needs would disappear along with that of many other businesses.

Most marketing cooperatives came out of the war stronger financially than ever before. They have paid off debts, built up reserves, and increased operating capital. The increased income of their farmer members resulting from higher prices for products and increased volume of business, together with the farmers' willingness to enlarge their equities in their cooperatives were largely responsible for this improved financial position.

Many marketing and purchasing cooperatives are increasing their activities by working with other associations. Local cooperatives are forming regional groups, and a few regional associations are cooperating to do jobs too big for the smaller organizations. As an example of the latter, four regionals joined together to produce feed, seed, and fertilizer for thousands of Northwestern farmers.

The scope and importance of agricultural cooperation in marketing farm products and purchasing farm supplies are indicated in the following summary: About 7,500 marketing cooperatives served a membership of about 2,730,000 farmers in 1943-44. The 2,780 purchasing associations had a membership of over 1,500,000 in that marketing season. In round numbers, 2,300 of the marketing associations are dairy cooperatives; 2,300 handle grain; 780 handle livestock and wool; about 950, fruits and vegetables, 530, cotton and cotton products; 160, poultry and poultry products; and about 500 handle other crops and furnish a variety of business services.

In 1943-44 these 10,300 marketing and purchasing cooperatives transacted business estimated at well over four billion dollars. Nearly 86 percent of this amount was accounted for by the marketing associations. The West North Central section of the country ranked first with nearly 30 percent.

Dairy, grain, and livestock associations led other commodities in the 1943-44 volume. Dairy cooperatives produced milk, cheese, butter, and non-fat dry milk solids for the war but had to make some adjustments. They shifted to receiving more whole milk and less cream from the farms. More associations have become interested in retailing milk of their members, and there is a trend toward large-scale dairy plants that can shift from one dairy product to another as market conditions change. Artificial breeding associations continued their rapid growth, from 95 to 195 in 1944.

Livestock cooperatives during the war found more farmers selling at country points and fewer shipping to terminal markets. As a result of these changes in methods of marketing, farmers in many sections of the country are planning to set up small meat-processing plants.

Higher prices accounted for most of the increase in dollar volume of business done by grain cooperatives in the last marketing season. More grain is moving to market through regionals from the locals

than ever before. The trend in seed purchasing and marketing is also toward local co-ops working together through regional associations.

In many parts of the country, cooperative farm supply associations are pacemakers in service, quality, and price. During the war substantial gains were made. Feed cooperatives doubled their annual tonnage; both the manufacture and distribution of fertilizer expanded considerably; in the petroleum field seven of the ten oil refineries now operated by cooperatives were purchased by regionals; several hundred miles of pipe line, a number of producing oil wells, and several thousand acres of oil leases were acquired.

A new cottonseed oil mill organized during the year brought the total to 14. Soybean cooperative mills made a big wartime jump . . . from only two in April 1942 to 21 by the middle of 1945.

Farmer-owned locker plants are one of the newest and the most rapidly growing of any type of cooperative . . . increasing by about 100 in the past year. These locker plants store food for their patrons. Many also do slaughtering and processing, handle packaged frozen foods from commercial firms, and service home freezers.

Eastern poultry associations have begun to broaden their operations, to supply members with hatching eggs, feed, and other supplies, and to operate poultry dressing plants. In commercial broiler areas several cooperatives have set up plants to process and market broilers.

In addition to providing fruits and vegetables in volume during the war, plants, and laboratories of some of these cooperatives did valuable research. One originated a process for converting by-products of fruit processing into industrial alcohol. Others developed citrus concentrates.

Cooperatives work together through their State-wide organizations, usually called State councils. There are now 32 such State councils. On the national scale they work together through the National Council of Farmer Cooperatives in Washington, D. C., the National Association of Cooperatives in Chicago, Ill., and the American Institute of Cooperation in Philadelphia.

W. W. FETROW.

AGRICULTURAL ECONOMICS, Bureau of. A Bureau of the U.S. Department of Agriculture created in 1922 by the merger of three existing units. It is the central statistical and economic research agency of the Department, and publishes a wide variety of facts about agriculture. Chief: Howard R. Tolley.

AGRICULTURE IN THE UNITED STATES. Farm production in the United States was in the hands of the weather man when World War II came to an end, and the termination of the hostilities affected it very little. Crop and livestock production together, aimed at goals adopted the previous fall, was very nearly equal to the record outputs of 1944 and 1942. Production of food grains was the largest on record, of feed grains the second largest, and of livestock products the second or third largest. Corn was again a three-billion bushel crop, for the fourth successive year; wheat production, as in 1944, exceeded one billion bushels; the oats crop for the first time passed 1½ billion bushels, and tobacco, the 2-billion pound mark. On the other hand cotton production, on the smallest acreage harvested since 1885, amounted to less than 9½ million bales and with one exception was the smallest cotton crop since 1899. Output of livestock and livestock products was about the same

as in 1944, and only 5 percent below the 1943 level. The slight reduction from 1944 in the total output resulted from lateness in planting, retarded plant growth, delays in farming operations, and frosts.

But the termination of the hostilities affected distribution very greatly. Almost immediately it reduced military requirements both for the United States forces and for this country's allies, but raised the demand for world relief purposes and for United States civilians. Subsequently, the distribution pattern underwent further change, from the dropping of the lend-lease system. In 1945, U. S. military and war services took 10 percent of the food output, exports of all kinds took 12 percent, and U. S. civilian consumption took the remainder. Forecasts of what the division would be in 1946 could not be precise, because foreign requirements were dependent on a host of problematical factors, notably occupation programs, relief plans, and credit negotiations. It was certain, nevertheless, that the division would be different from that of the previous years. On the assumption, for example, that our total military strength would drop to 3 million by the end of 1946, the Department of Agriculture estimated U. S. military food requirements for the year would be only one-fifth as great as those of the high point in 1945. Conversely, the Department looked for an increased total U. S. civilian food consumption along with an important though unpredictable increase in relief shipments and commercial exports. In the war years it was not possible to produce enough food for all requirements; but it was evident that in the postwar years the farmers' problem would ultimately be the opposite one of markets, distribution, and price-relationships.

Nevertheless, postwar problems of agricultural readjustment were not immediately urgent; on the contrary, the outlook for the years immediately ahead was favorable. Assuming high U. S. employment in the reconversion period, and also considerable farm export trade, the Department of Agriculture surmised the market for most farm products would be temporarily about equal to the farm production capacity—about one-fourth above prewar. This required per capita domestic consumption at 8 or 10 percent above prewar levels, plus exports at about the same percentage of the production as those of 1945. The export percentage of the farm output was near this level or about 12 percent in the first years after World War I, though in the late 1930's it dropped to 4 percent. It was not the short-run but the long-run problem that chiefly preoccupied farm economists—the problem of making the food demand stay in balance with production power. Even full employment, they pointed out, would not do away with the need for some crop adjustments; serious unemployment would call for additional crop curtailment, and perhaps also for extensive surplus-disposal programs.

Farmers increased their wartime overall production by roughly one-third above the prewar level. This was a threefold greater increase than that of the World War I years. Gross farm production was only about 24 percent larger than during the prewar (1935-39) period; but among other things this figure includes the production of feed for farm horses and mules, an item that has been declining for many years; it has been largely supplanted by urban production of machinery and fuel. With the feed consumed by farm horses and mules eliminated, and the reckoning confined to production for sale and for use as food on the

farm, the 1944 total for example was 36 percent above the average for the five prewar years; the percentage for 1945 was about 31. Production of food alone on farms in 1944 was 38 percent above prewar; the calculation for 1945 is not yet available. Noteworthy too was the wartime change in the composition of the farm output. Cash crops, with cotton an important exception, averaged from 15 to 20 percent higher in volume. Output of oil-seed crops for the three years 1943-45 was nearly three times the prewar average. Hog production at the 1943 peak was 77 percent above prewar; dairy production from 1943 through 1944 was 15 percent higher. This change in the crop pattern involved difficulties and costs.

Agriculture achieved its wartime increase with 10 percent fewer workers on farms, and with machinery and other facilities relatively scarce. Progress in farm technology, along with a general lengthening of working hours, was chiefly responsible for the rise in the farm output. True, the weather was favorable for crops throughout the war years; but the Department of Agriculture credits the above-average weather that prevailed with only one-quarter of the increase. Little of it can be attributed to crop-acreage expansion; the wartime peak of planted acreage in 1944 was only 2 percent above the prewar average. Big factors in the gain were increased use of machinery, aided by much pooling, and an 85 percent jump in the use of commercial fertilizer. Other aids to the farm war effort included a more general use of improved crop varieties, drafts on fertility previously stored by conservation practices, and better feeding of livestock. Farmers adopted improved practices to an extent that could not have been predicted, and accomplished almost a technical revolution.

Farmers now have sufficient production-capacity to maintain their output of cash crops, such as wheat, cotton, tobacco, fruits and vegetables, and oilseeds, at probably 25 percent above the prewar level. They have enough capacity to keep their output of feed crops such as corn, oats, barley, grain sorghums, and hay at about the same percentage higher. Livestock production in 1943, 1944, and 1945 averaged about 40 percent above the prewar level; farmers can easily maintain it, says the Department of Agriculture, at about 25 or 30 percent above the 1935-39 average. The jump to 40 percent higher in the war years resulted partly from the use of big feed reserves. Hereafter, better feeding practices, the improvement of pastures, and other methods will provide stimulus. For example, some land now in intertilled crops will be shifted to grasses and legumes, with advantage to livestock raising. But in order to use their expanded production-capacity, the farmers will need high domestic consumption and a lively export trade. Though the immediate outlook is good, the longer-time problem will require serious planning and action. Some notice of this problem will be appropriate later in this article, after a glance at the world food situation, which constitutes the total setting for the farm adjustment.

The World Food Situation. Measured in calories the total world output of food in 1945-46 may be about 3 percent less than the prewar average. This is an estimate by the Department of Agriculture, based on reports from its own representatives abroad and on reports from foreign governments. It seems like a small reduction, after more than five years of literally world-wide destructive war; but in these years the world's population has grown, despite the slaughter. On a per capita basis the 1945-46 world food production may be as

much as ten percent below the prewar level, and by countries it will be very unequally distributed. Some countries, notably those of the western hemisphere, will have more food than they had before the war; but other countries will have very much less. Thus continental Europe (not including the USSR) and North Africa combined may have an output as much as 25 percent below the pre-war average. Production in Japan may be as much below the prewar level as that of continental Europe. It is below the prewar average in other areas of the Far East.

Sharp reductions in most major food products add to the seriousness of the problem. Supplies of rice, sugar, fats and oils, and meat products will be much below prewar levels. Even wheat, though more abundant than before the war, will be less plentiful than during the war. World milk production may be lower than in prewar years, despite the increase in North America. In Europe livestock production has declined tremendously, poultry and eggs the most. Supplies of wheat, rice, and other foods in India and China, though likely to be about equal to that of the prewar years, will not cover the population-growth, and will not reach all needy areas. Supplies in the USSR however will be greater than in 1944-45, though still far below pre-war.

In contrast with the United States most European and Asiatic countries have a shortage of production-capacity. Almost everything required in farming is scarce from seeds to draft-power and transportation. In many places even manpower is not available, not to speak of machinery, fertilizer, feeds, fuel, and machinery. Paradoxically, moreover, the farmers suffer from a lack of markets. This is not the result of any lack of human need for foods and other farm products, but of breakdowns in distribution systems, and of shortages of goods that farmers need. In many countries inflation renders money unacceptable. Farmers often hoard their crops, and wait for chances to barter them. Political and social disturbances interfere with agricultural operations, notably in the Balkan countries and throughout the Danube Basin. Programs for the partition of great estates hamper production at least temporarily.

Nevertheless, with average weather conditions, world food-production should increase in 1946-47. In the Orient, particularly in rice and oil-crop areas, it should benefit from restored access to world markets, as well as from the decline of fighting. In continental Europe it should benefit from plans that are being worked out for increasing the supply of fertilizer and machinery. It may be some years, particularly in eastern Europe, before farm production gets back to normal; but the output should soon rise from the present low level. Fuel and transportation, which have been critically short, will be more easily obtained. Livestock production requires large amounts of imported feedstuffs and may lag behind the crop recovery; but some increase is likely even in the livestock industries. Probably 1946 will be the most critical year. Necessary food imports for continental Europe, exclusive of the USSR, have been estimated for the food year 1945-46 at above 18 million tons. This is the amount necessary to raise legal non-farm supplies in liberated countries to 2,000 calories per person per day, to provide minimum supplies for ex-enemy countries, and to allow some increase in imports to neutral countries.

Participation in Relief Shipments Compatible with High U. S. Consumption. Meantime, this country and some of the other United Nations will continue

to provide considerable food for hungry countries. President Truman committed the U. S. to the policy of helping Europe to the limit of our strength; he instructed government agencies to put various emergency measures into effect, as means of helping to prevent mass starvation in many countries. In half of Europe the urban population was existing on as little as 2,000 calories or less per day, as compared with the estimated 3,260 calories per day available to people in this country. About 100,000,000 people in Europe in 1945 had less than 1,500 calories per day. The Congress approved further allocation of funds to UNRRA; but year-end reports from Europe indicated 1946 food supplies there would fall below the earlier expectations, and showed that the need would exceed the provision for meeting it.

Measures under consideration as 1945 ended included additional emphasis on food conservation in this country; the production, by means of a higher extraction rate, of more flour from each bushel of wheat milled; priorities for the rail movement of foods to the seaboard; the control of wheat and flour exports to destinations of greatest need; the reduced use of grains in the production of alcoholic beverages; greater conservation of grain in the feeding of livestock, in line with the principle that when lives are at stake the food-use of grain will take care of more people than the conversion of grain into livestock products. Stocks of wheat in the U. S. were 61 million bushels less than had been anticipated, as a result chiefly of the increased feeding of grain to hogs, cattle, and poultry. Accordingly, ceiling-changes were proposed to encourage marketings of animals at lighter weights. Our farmers had no immediate need to worry about food surpluses; it was evident that in 1946 all the food that could be raised would be in urgent demand at home and abroad.

This prospect, along with the expectation that per capita consumption of food in the United States would rise above the wartime level, removed immediate worry over the farmers' markets. Food production in war years provided abundantly for our armed forces, liberally for lend-lease shipments, and more than the pre-war average for United States civilians. Specifically, the per capita consumption of food in the United States rose and stayed at about 8 percent above pre-war, and it consisted to a higher degree than previously of the better foods. In the absence of rationing the consumption-level would have gone higher. Even if the per capita rate shows no change, total civilian consumption will increase in 1946, as a result of demobilization and well maintained consumer buying power. Thus agriculture's immediate problems should be manageable. Some change from the wartime pattern of production may be required; but the change will not be of such a nature as to involve any large net curtailment of the output, though the Department of Agriculture says production goals must be highly selective in order to avoid both surpluses and shortages. Up to the end of November no important overall cut-backs had been proposed, though some crop shifts had been advised.

Rationing Ended Except of Sugar. On November 24, 1945, the Secretary of Agriculture, with the Price Administrator concurring, announced termination of the rationing of meats, canned fish, and fats and oils. The only food item left under rationing was sugar. Because of a serious worldwide shortage, there was no immediate prospect of lifting sugar rationing. The decision to lift the rationing of the other foodstuffs was made possible by changes

since V-J Day in food requirements and supplies, notably sharp reductions in military takings, seasonal increases in livestock slaughter, an increase in the production of chickens and turkeys to an all-time high level, and prospects for a record supply of eggs. Supplies of meat available to U. S. civilians for the month of December, 1945, were estimated to be at an annual rate of 165 pounds per capita, as compared with the prewar (1935-39) average of 126 pounds. This was after allowing for military needs and for set-asides to provide more than 30 million pounds weekly for shipment to Allied and liberated countries plus a substantial amount for commercial export. Allowance for the taking of a substantial tonnage by UNRRA, the department said, would still leave supplies above the quantities that would necessitate continued rationing.

In 1946, the announcement stated, the civilian meat supply would continue favorable, though with some tightening in the second and third quarters. Fats and oils, it explained, would continue in short supply; but discontinuance of the rationing of these commodities in the United States appeared to be preferable to the institution of a completely new system of rationing for fats and oils alone, such as would be necessary with meat rationing terminated. Such a new system would involve the registration of more than 500,000 industrial and institutional users and the possible issuance of new ration books to all civilians. Allowing conservatively for exports of fats and oils for essential relief purposes, the Department estimated civilian supplies of fats and oils in the first half of 1946 might be nearly 10 percent below the prewar rate.

Consumption of fats and oils in war-ravaged countries was certain to continue far below prewar levels for some time, and it was essential that steps should be taken to fill their minimum needs. Besides making some supplies available from the United States for this purpose, the Department was acting to obtain all the vegetable oils possible from the recently liberated Far Eastern areas. It was on the lookout for supplies which might be available elsewhere, and was improving the collection and procurement machinery. Also, it was urging continued effort to prevent waste and to salvage waste fats. Meantime, the Department said, the set-asides and other regulations would be continued, and manufacturers of shortening, margarine, salad, and other edible oil products would be asked to operate under the existing quota limitations. In addition, allocations and export and import controls would be maintained.

U. S. Agriculture's Long-time Problems. Looking beyond the reconversion phase, during which relief and other urgent demands abroad plus active domestic employment may be expected to sustain the demand for farm products, agricultural economists attempted to sketch out basic long-term probabilities. They did not foresee an indefinite continuance of the demand at the prevailing level, or at any rate not a continuance of it automatically. Two factors in the current situation, they pointed out, would eventually have to be replaced—deferred spending in the home market and relief shipments to foreign countries. Urban employment might run high temporarily on the basis of deferred spending to fill shortages; but the most liberal estimates for this factor, which draws on wartime savings, allowed it only a few years. As for the relief call, it seemed likely to have an even briefer life, though with prospects that commercial foreign takings would ultimately fill the gap. Agriculture's hopes for the longer future could not rest on the

backlog of deferred domestic demand; yet plans to provide a more lasting adequate demand were in only the discussion stage. Its hopes for export trade on a commercial basis encountered a different obstacle—the necessity to meet competitive world prices. This opened up the entire problem of price-policy, for the domestic as well as the foreign market, along with the related problem of production-planning.

Agriculture can influence the domestic demand for its products only to a very limited extent; it has almost no say, for example, with regard to volume of urban employment. On the other hand, it can decide very largely, in terms of price-policy, what is to happen to its commercial exports. Officials of the Department of Agriculture reminded farmers that in order to get an adequate foreign market for their products they would have to meet the price-terms required. Specifically, they said, it might be necessary to sell part of the farm output at world prices below domestic prices. The Surplus Property Disposal Act of 1944 (Public Law 457, 78th Cong.) authorizes this procedure. It allows the Commodity Credit Corporation to sell farm commodities and the products thereof in world markets at world prices. This may be done, however, in a number of very different ways. Study of the various possibilities bulked large in the agricultural discussions of 1945. Mainly the discussion turned around the necessity for adjusting price-support and production policy to postwar needs. There was no disposition to challenge the parity income goal for agriculture, as defined in the Soil Conservation and Domestic Allotment Act of 1937. Experience had shown, however, that parity prices did not always necessarily produce parity incomes, owing to the fact that in certain cases notably in connection with the export crops parity prices interfered with sales. Hence, farm economists examined other possible methods of reaching the farm-income objective.

Agricultural price-policy has been determined for the years immediately ahead by federal legislation, some of it of prewar origin. Briefly, this legislation provides that for two years following designation of the end of hostilities the Government will support both the so-called basic and the so-called Steagall amendment commodities at not less than 90 percent of parity, and that it will support the prices of other farm products on a comparable basis to the extent that funds are available and producers are able to bring their supplies into line with demand. The basic crops are the ones named as such in the Agricultural Adjustment Acts—namely, cotton, corn, wheat, tobacco, rice, and peanuts for nuts. So-called Steagall amendment commodities are those formally proclaimed during the war as needed in increased amounts. Support prices have been announced also for some non-basic and non-Steagall commodities. As mentioned, the price commitment for commodities other than basic and Steagall commodities is conditional upon the availability of funds and the adjustment of supply. When the two years after the declared end of the hostilities are up, the whole broad question of price-support and production policy will be due for overhauling, and the Department of Agriculture has already drawn attention to some of the things that will have to be considered.

Farm policy in postwar years, the Department indicated, would face the twofold problem of protecting the farmer's income and maintaining outlets for farm production. It noted the Congress had manifested an intention to provide whatever funds might be required, and said these funds would be used in line with the authorized procedures best

sulted to achieve a sound reconversion pattern. The basic legislation authorizes many different procedures, such as commodity loans, subsidization of exports, acreage allotments, and marketing quotas.

Cotton and wheat are the problem crops in world trade. Heretofore, in peacetime, we depended on foreign countries to take more than half our cotton crop each year. The war almost suspended our cotton export trade. Our own consumption increased, however, and we sent some cotton abroad as lend-lease aid, with the result that our surplus did not increase though it remained large. But we need foreign customers. This is also true, though less urgently, of wheat. Our price-supports, which hold domestic cotton and wheat prices far above world prices, stand in the way; and though temporarily we have export-subsidy facilities, the search is on for a more permanent procedure.

Among numerous possibilities, two at the opposite extremes may be thrown out—price support at full parity for unlimited production; and no price or income support at all. Three intermediate possibilities may be mentioned: (1) Maintenance of cotton at parity only for the domestic portion of the crop, with the growers entitled on a prorata basis only to the world price for the rest, and with full scope to produce all the cotton they wish; or in other words a two-price system: (2) one price, adjusted to the world level, for the entire crop, with growers entitled to government payments as partial compensation, and not obliged to make any crop adjustments; and (3) the same world price, accompanied by government payments to maintain the income level of growers and supported by an extensive, regional conversion program with crop diversification and local industrialization as main features.

Such plans presuppose a transition to a free or world-market basis, with government payments used as shock absorbers and changes effected meanwhile in the structure and costs of cotton and wheat farming. These proposed reorientations of the export crops to export markets reflect a belief that the straight export-subsidy plan will not prove permanently workable. They refer, of course, to long-range possibilities, since legislation already on the statute books determines the immediate price-policy. Common to them all is an intention to fulfill the basic objective of current and recent farm policy; namely, to assist farmers in getting a fair share of the national income. Specifically, they involve a decision as to whether cotton and wheat growers want relatively high prices with a relatively small market or lower prices with a larger market.

The basic question of overall farm policy, as an inter-bureau committee of the Department of Agriculture expressed it, was to what extent the nation would have to rely on restrictive measures, and to what extent it would prove possible to depend on full and efficient production in a national economy geared to full employment, increased consumption, and expanded world trade. Barriers to world trade, the committee said, should be reduced. It declared the world ought not to return to the prewar practice of national price or income-support measures adopted unilaterally by most producing countries without regard to the effects on other countries. Instead, the problem of handling world supplies should be met by international arrangements, designed both to maintain prosperity in agriculture and to promote a high rate of consumption throughout the world.

In the United States, the committee added, it would be important to have a high level of export

trade in factory products as well as in farm commodities, since exports of industrial goods would help to maintain domestic employment and consumption. Along with fulfillment of price or income-support commitments, the committee recommended that more stress than in the past should be laid on ways of stabilizing farm income by means other than production control and price-supports, especially on programs aimed at expanding the world demand for farm products, reducing the costs of agricultural production and marketing, and improving farm living conditions through the provision of better roads, schools, housing, and health facilities. Underlying this general principle is the conviction that beyond a certain point, the drawbacks exceed the advantages of production-control and price-support. This is especially true of crops that must be exported in large amounts; applied to these, the attempt to regulate production and prices makes the going easier for competing countries.

It is impossible to dispense with farm export trade. Without farm exports, no speedy solution of the American farm problem is conceivable. Even in the late 1930's, after a decade of near paralysis in world trade, this country exported about 40 percent of its cotton, about one-third of its tobacco, nearly one-tenth of its wheat, and large quantities of rice, lard, and fruits. Expanded in the war effort, the export power is even greater now. With so much of its production designed for export, agriculture needs foreign outlets to safeguard its domestic business. Formerly, this was obvious; if exports stalled, domestic prices slumped. In a somewhat different manner the principle holds under the price-support system; for if price-supports oblige the government to store the export surplus, the ultimate result is either a surplus-disposal problem or drastic crop limitation. Hence, as long as production for export continues at all, it poses a problem which is at once domestic and international. With the government supporting crop prices, the problem is how to keep on doing that and at the same time move export surpluses into export channels in ways that foreign countries will not oppose. It is a problem, of course, in international cooperation, possibly made easier by the fact that most countries now have price and trade controls. Obviously, if they expect to do much business with one another, they must reconcile their domestic with their world trade operations. This applies as fully to the United States as it does to other countries, as numerous official statements acknowledge.

In connection with these and other discussions of the world trade problem the Department of Agriculture has pointed out that the United States seeks no unfair advantage. It wishes only to offset its handicaps. These have partly resulted from measures taken to improve the prices of the export crops—measures that have benefited foreign as well as American farmers. How these measures should be altered has not yet been determined; but that they must be altered everyone admits, because the system inherited from prewar years tends to hamper United States farm export trade. Hence, while insisting upon its right to act, the government has offered to negotiate arrangements with other countries by which they may be protected from untoward or unintended consequences. Essentially, the problem is to harmonize the price-supports with the necessity to sell export supplies on a competitive basis. Chiefly required is a method for working out practical mechanisms for international collaboration.

Farm Income in 1945. Cash receipts from farm marketings in 1945 seemed likely to total about 20,400 million dollars—3 percent more than in 1944. The income from crops was expected to be 5 to 10 percent above the previous last year's, while the income from livestock and livestock products reflected decreased sales, particularly in hogs.

Marketings of crop and livestock combined were about the same as the record total of 1944, but included an unusually large proportion of crops from the previous year's harvests. Total marketings of crops in 1945 were about 7 percent greater than those of 1944, while marketings of livestock and livestock products were smaller by about the same percentage. Prices received by farmers in 1945 were about 2 percent higher than in 1944 with livestock and livestock products showing a greater gain than crops.

Total expenses of farm production for 1945 were about 4 percent above those of 1944. Increases were relatively large in labor costs and in maintenance and depreciation. Wage rates were up about 8 percent; the value of perquisites to hired workers was up slightly, in line with the higher value of farm products. The total costs of hired labor in agriculture, for wages and perquisites, seemed likely to be about 7 percent higher than in 1944. Charges for maintenance and depreciation increased partly because farmers had more opportunity to replace outworn and outmoded equipment. Expenses of maintenance and depreciation were from 5 to 10 percent above 1944. Expenditures for purchased feed declined. Taxes and mortgage interest showed little change from 1944.

Analysis of the receipts and the expenditures indicated the net income to operators in 1945 would be about 3 percent higher than in 1944. Value of products consumed in farm homes was slightly higher; the rental value of operators' dwellings showed a small increase, in line with some rise that had taken place in real estate values; government payments were about the same as in 1944.

Agriculture's Balance Sheet. Measured by the dollar value of its goods, agriculture increased from a 49-billion-dollar industry to a 74-billion-dollar industry during the five years ended January 1, 1945. During 1944 the increase was from 69 to 74 billion dollars; comparable figures for 1945 are not yet available. Farmers' financial assets, such as currency, deposits, and war bonds increased from an estimated 5 billion dollars on January 1, 1940 to 13 billion dollars on January 1, 1944 and to nearly 17 billion dollars on January 1, 1945.

Farmers' liabilities have decreased. Farm-mortgage indebtedness, at 5,271 million dollars on January 1, 1945, was 364 million dollars less than a year earlier, and 1,316 million dollars less than on January 1, 1940. The 1945 total was less than one-half the all-time peak in 1923 and was the lowest since 1916. Non-real-estate indebtedness (excluding non-recourse loans guaranteed by CCC) showed a slight decline.

Obviously, proprietors' equities have benefited. The proprietors held a 90 percent interest in the physical and financial assets associated with agriculture on January 1, 1945. This proprietary interest totaled 81,820 million dollars, or 8,447 million dollars more than a year earlier and 38,036 million more than five years earlier.

Farm income has been high since the war began. The wartime rise of prices has been the chief factor in the improvement of agriculture's financial structure. In 1944, however, total net income from agriculture, excluding Government payments, de-

clined to 14.9 billion dollars as compared with 15.2 billion dollars in 1943, which may prove to have been the wartime peak. The decline in the net income was in the face of a rising gross income, which includes not only cash receipts from marketings but also the value of products retained on farms for home consumption and the rental value of farm home.

Caused, in part, by rising operating expenses, the principal cause of the 1944 decline in the net farm income was the necessary charge against receipts for heavy inventory reductions. Gross income in 1944 included returns not only from the sale of the enlarged output of that year, but also, in a larger degree than usual, from the sale of output of former years. The inventory of such items for sale decreased 415 million dollars in 1944, largely as a result of decreases in numbers of livestock on farms.

The increase in value of physical assets during 1944 was largely the result of a further 4.7 billion-dollar rise in land values. A .394-million-dollar increase in machinery and automobiles and a 250-million-dollar increase in crops on hand were almost exactly offset by a 668-million-dollars decrease in the value of livestock.

Farm real estate accounted for 55 percent of the total assets on January 1, 1945; it increased in value from 33,642 million dollars in 1940 to 50,295 million dollars in 1945, or about 50 percent. Value of livestock and crop inventories reflected both by physical increases and higher prices. The index of prices received by farmers for farm products averaged 195 (1910-14 = 100) in 1944 or about 1.6 percent higher than in the previous year.

Principal Crop Results of 1945. Farm production in 1945, as noticed at the beginning of this article, was about as large as the United States has ever known. Farmers had difficulty with their seeding in the fall of 1944; much fall grain had to be sown in dry ground or much later than usual. But October rains speeded seeding operations and gave grains seeded in the dust a chance to germinate. Hence 1945 began with yield prospects above the average, and an early spring further improved them. In fact the weather favored small grains until they were mature, although it was less favorable for other crops. But subsequently the weather became favorable for the late maturing crops, and harvesting proceeded without serious losses.

In production facilities the farmers began the season with no bad handicaps. Labor, to be sure, was still scarce; but farms had been mechanized pretty generally, to the extent that the supply of tractors and other implements permitted. Other difficulties occasioned by the war, such as transportation delays and shortages of certain supplies, were less serious than in the previous war years. Farmers had to refrain from expanding their crop acreage as much as would have been possible in the absence of these handicaps, and they found it necessary also to emphasize the crops that would produce the most from the facilities available. On the whole, nevertheless, the season's work encountered no bad set-backs and resulted in an output as well adapted to requirements, both in volume and in composition, as that of any of the previous war years.

Acreage of all crops harvested, as estimated by the Department of Agriculture in November, was 351 million acres. This was only slightly less than the acreage of 1944 and was the second largest since the period 1928 to 1932, during which the combined acreage varied from 351 to 362 million acres. Some shift took place from row crops to

small grains, because the labor requirement for small grains is lighter. Nevertheless, the farmers were not able to plant all the small grains, sorghums, and corn they had planned. They increased their acreages of tobacco, of sugar beets, and of truck crops, though these crops have high labor requirements. On the other hand, cotton growers planted only 13,355,000 acres, ten percent less than in 1944 and less than in any previous year in this century. Acreages of corn, barley, peanuts, cotton, and sugar crops were below the goals by an aggregate of nearly 12 million acres or 3 percent.

A second successive billion-bushel wheat crop was harvested. At 1,150 million bushels, it exceeded the previous record crop of 1944 by nearly 7 percent. The yield, at 17.7 bushels per harvested acre, was well above the average, though not a record. A relatively large proportion of the seeded acreages of winter wheat remained for harvest as grain, and the spring wheat crop was large. On the other hand, the rye crop was small, though yields were above average. Rice yielded well and produced a record crop in spite of a disastrous tropical storm in the rice area of Texas. Buckwheat production was above average but below that of 1944.

Corn production, for the fourth successive year, exceeded 3 billion bushels and was the third largest of record. The yield per harvested acre was exceeded only in 1942. About 64 percent of the acreage was planted with hybrid seed. Besides increasing the yield, the use of hybrid seed helped the crop, which had been planted under adverse conditions, to mature quickly and uniformly enough to escape major frost damage, though frosts in the northern and western Corn Belt occurred at about the usual dates.

Farmers harvested the first 1½ billion-bushel oats crop. Favorable growing weather counteracted the effects of late planting and resulted in high test weight and a heavy yield per acre. Barley, grown on a smaller than average acreage, gave the highest yield per acre since 1915, and the production was slightly above the average. Acreage of sorghum grain was reduced by relatively light abandonment of wheat acreage in the Southwest, where abandoned wheat land is often replanted to sorghums. On much of the acreage the sorghum crop was planted late. Moreover, it suffered from dry weather and from frosts; nevertheless, although much below the 1944 crop, it was the fourth largest ever produced.

Cotton production, on the smallest acreage harvested since 1885, was less than 10 million bales, and with the exception of the 1934 crop was the smallest since 1922. Plantings were late and the season was unusually wet. As a result, the growth was rank, and harvesting and ginning extremely slow.

Tobacco for the first time passed the 2 billion-pound mark. Growing conditions favored the late crop. Production of peanuts was more than 2½ billion pounds. At 53 percent above the 1934-43 average, it was an all time record. Production of soybeans topped all previous records, though much of the soybean acreage was planted late and the pods did not fill as well as expected. Dry beans were the smallest crop since 1936, and many of the beans were immature or damaged by frost and rain. Hay, potatoes, and flaxseed were near-record crops, and the outturn of sweet potatoes was above average.

The citrus crop promised to be a record. Peaches, pears, and sweet cherries were record crops. On the other hand, apples and sour cherries were record lows. Together, the citrus and deciduous

fruit crops were about 5 percent less than in 1944, but 17 percent above the average. Production of tree nuts was greater than in 1944 and about a third more than average. Production of commercial vegetables for the year set a new high record; it was at least one-fourth above average. Output of vegetables grown for processing exceeded the average by more than 40 percent. Seed crops suffered from unusually wet weather at harvest time; yet the production was above average and indicated relatively few seeds would fall short of 1946 requirements.

Total food grain production was 37 million tons—2 million tons more than in any other year. Total feed grain production was 121 million tons. Together with the big hay crop and a large tonnage of other roughages, it gave a feed supply exceeded only once before—in 1942. At the beginning of the October feeding season, supplies of feed per animal unit were the largest in the 20 years of record. Pastures and green feeds were abundant until a late date.

Production of livestock and livestock products in 1945 was at about the same level as in 1944—only 5 percent below the all-time high of 1943. It was estimated approximately 45 billion pounds live weight of cattle, hogs, sheep, and poultry would be produced in 1945, or about 6 billion pounds less than the 1943 production and slightly less than that of 1944 or 1942 but substantially more than that of any other year. Milk production promised to establish a new record at about 123 billion pounds; production per cow was near the record level. Farm poultry produced eggs at a record rate per layer, but the number of layers averaged 8 percent less than in 1944. Farm production of eggs in 1945 was expected to reach 4.6 billion dozen—second only to the 1944 record.

Some Results of Agricultural Research. Shortly after Pearl Harbor, the Surgeon General's Office of the Army requested the Bureau of Entomology and Plant Quarantine to conduct studies on the fumigation of clothing and personal equipment because of the need for a more efficient method than steam sterilization for freeing servicemen from all stages of body lice, the carrier of typhus. Within a few months specialists in the Bureau of Entomology and Plant Quarantine demonstrated that all stages of body lice could be killed by relatively short exposure to methyl bromide gas, at any temperature. Practical methods of methyl bromide fumigation were developed and have been in use by the armed forces since 1943. These include individual fumigation bags for treating one soldier's outfit and demountable fumigation vaults for use in the field and at debarkation ports.

In the past four years more than a hundred new varieties of crop plants have been released to the public largely as the result of federal cooperation with State experiment stations. These varieties were mostly the culmination of previous work, but new methods made it possible to multiply seed supplies of many of them quickly. The new varieties included grains, forage crops, fruits and vegetables. A few were strictly the result of war-stimulated research; others became available more quickly than they would have done in peacetime.

For example the productive stiff-strawed Clinton variety of oats, now getting into big commercial production, started with 25 pounds of seed produced at Ames, Iowa, in July, 1943, and planted on irrigated land at Mesa, Arizona, in November 1943. From this planting about 2,000 pounds were harvested in April 1944. Sown May 20 on irrigated land at Aberdeen, Idaho, this additional seed pro-

duced 20 tons in August, only a little more than a year from the original harvest of 25 pounds. The 20 tons (or about 1,200 bushels) were planted by farmer seed growers in the Middle West in the spring of 1945. Some 40,000 bushels of Clinton oats (1,280,000 pounds) are available for 1946 planting.

Light on the delicate relation between mineral nutrition and the susceptibility of crops to certain diseases appears in reports of the Virginia Agricultural Experiment Station. Evidence presented points to the probability that a lack of sufficient potash may render corn plants more susceptible to damage from bacterial wilt by reason of the resulting accumulation of nitrate in the water-conducting tubes of the corn stem. Deficiencies of other elements are thought to have a possible bearing on the disease reactions of various plants and on their reactions to parasites that invade the water-carrying elements in the wood.

Work of the New Jersey Agricultural Experiment Station, a pioneer in studies of antibiotic substances produced by micro-organisms, has brought fourth evidence that the production of penicillin is not confined to any one species of fungus or even to the mold genus *Penicillium*, and that the conditions favoring maximum yields differ with the species or strains involved, most of which also produce a second antibiotic factor. Furthermore, this Station has isolated and described six other antibiotic substances produced from the soil, viz., actinomycin, clavacin, fumigacin, streptothricin, streptomycin, and chaetomin. Of these, the two showing the most promise are streptothricin and streptomycin.

In tests of penicillin by the Arizona Station against plant pathogenic bacteria, crown galls induced by bacterial inoculation were destroyed by wrapping antiseptic cotton soaked in crude penicillin around them after puncturing the galls in numerous places with a sterile needle. The method is suggested for trial on nursery stock and set trees and on other plants with galls limited to aerial parts.

The feeding of a ration of cull beans and alfalfa to ewes during gestation and lactation resulted in a high percentage of offspring affected with stiff-lamb disease, in experiments by the New York (Cornell) Station. Administration of two doses weekly of 9 ml. per ewe of an 8.25 percent solution of mixed tocopherols in cottonseed oil starting 24 days before the first lamb was born prevented the occurrence of this disorder in any of the lambs. Furthermore, lambs from ewes on the unsupplemented diet, when treated with 2 ml. of an olive oil solution of 140 mg. alpha-tocopherol acetate, were protected against the disease. Subcutaneous injection of an aqueous solution of an alpha-tocopherol compound also proved efficient for treating affected lambs.

Scientists have recently found that certain so-called growth-regulating substances, called hormones, are useful as herbicides. They will kill some plants and not others. Studies have shown great promise as a weed killer for one of these substances—2,4-Dichloro-phenoxyacetic acid. A method devised by the Bureau of Plant Industry, Soils, and Agricultural Engineering, and tested in collaboration with State agricultural experiment stations and the U. S. Golf Association, has shown good results on lawns, golf courses, grain fields, and areas bearing other plants of the grass family, though it is not yet recommended for pastures. It does not hurt Kentucky bluegrass or weed grasses such as crab grass and quack grass; yet it affects bent

grasses and White Dutch clover, as well as a considerable list of weeds.

Correcting Mineral Deficiencies Increases Beef Production. Experiments in federal and State agencies showed that one way to step up beef production in some range areas is to feed phosphorus supplements to breeding cattle. Especially in the Gulf Coast region much of the vegetation available for grazing is deficient in this mineral. Correcting the deficiency results in more and better calves. Early results of cooperative investigations in southern Texas showed that feeding bonemeal and disodium phosphate to cattle, by hand dosing, was beneficial in two ways. It prevented the onset of phosphorus deficiency and, in animals already affected, corrected it if not too far advanced.

ARTHUR P. CHEW.

AGRICULTURE, U.S. Department of. A Department of the U.S. Government, created by Act of Congress, May 15, 1862, and directed by law to acquire and diffuse useful information on agricultural subjects in the most general and comprehensive sense. The Department performs functions relating to research, education, conservation, marketing, regulatory work, and agricultural adjustment. It conducts research in agricultural and industrial chemistry, the industrial uses of farm products, entomology, soils, agricultural engineering, agricultural economics, marketing, crop and livestock production, production and manufacture of dairy products, human nutrition, home economics, and conservation. It makes research results available for practical farm application through extension and experiment station work in cooperation with the States.

The Department provides crop reports, commodity standards, Federal meat inspection service, and other marketing services. It seeks to eradicate and control plant and animal diseases and pests. It administers more than 50 regulatory laws designed to protect the farmer and consuming public, and enforces the Sugar Act of 1937 and the Commodity Exchange Act, June 15, 1936. It promotes the efficient use of soils and forests. It provides rural rehabilitation, and guarantees farmers a fair price and a stable market through commodity loans and marketing quotas. It also provides agricultural credit, assists tenants to become farm owners, and facilitates the introduction of electric service to persons in rural areas.

Changes During War Years. Early in the war period the Department of Agriculture functioned as a food administration though without any formal order. On December 5, 1942, President Roosevelt by an executive order made it officially responsible. This order, which announced a reorganization of the Department, placed all Department agencies concerned with food production under a Director of Food Production and grouped all department agencies concerned with food processing, storage, allocation, and distribution under a Director of Food Distribution. In March, 1945, by another executive order, this arrangement gave place to a new delineation of wartime food responsibilities. Parts of the existing food production and food distribution administrations became the War Food Administration, which managed the war food job until June 30, 1945, when by its own request the President abolished it and merged its functions with those of the Department of Agriculture.

Subsequently the Secretary of Agriculture, Clinton P. Anderson, announced the appointment of a Committee on Departmental Reorganization. On the advice of this committee the Secretary announced the establishment of a Production and

Marketing Administration which was, in effect, a consolidation of the following agencies: Office of Basic Commodities, Office of Supply, Office of the President of the Commodity Credit Corporation, Offices of the Manager and of the Secretary of the Federal Crop Insurance Corporation, Office of Marketing Services, Agricultural Adjustment Agency, Office of Requirements and Allocations, Office of Price, Office of Transportation, Office of Materials and Facilities, Office of Labor, Office of Home Food Supply, Office of Investigatory Services, and the liquidating Federal Surplus Commodities Corporation.

Principal agencies of the Department include the following: The Agricultural Research Administration, which directs and supervises most of the scientific research activities of the Department. Agencies which report to ARA include: the Bureau of Agricultural and Industrial Chemistry, the Bureau of Animal Industry, the Bureau of Dairy Industry, the Bureau of Entomology and Plant Quarantine, the Bureau of Human Nutrition and Home Economics, the Bureau of Plant Industry, Soils, and Agricultural Engineering, the Office of Experiment Stations, and the Agricultural Research Center of Beltsville, Maryland.

Other important agencies of the Department are: the Extension Service which cooperates with State agricultural agencies in education programs; the Farm Credit Administration, organized to provide a complete credit service for farmers and farmer cooperative associations; the Farm Security Administration, which makes loans and gives technical supervision to family-type farmers unable to get sufficient credit elsewhere; the Forest Service; the Rural Electrification Administration; the Soil Conservation Service; the Bureau of Agricultural Economics; and the Office of Foreign Agricultural Relations.

Legislative Basis of Action Agencies. In 1929 the Agricultural Marketing Act was passed, followed by the establishment of the Farm Board. The Foreign Agricultural Service Act was enacted in 1930. Enactment of the Agricultural Adjustment Act May 12, 1933, resulted in the setting up of many "action agencies" in the Department. This act was designed to establish and maintain such balance between the production and consumption of agricultural commodities, and such marketing conditions therefor, as would reestablish prices to farmers at a level that would give farm products the purchasing power they had in specified earlier base periods. The base period for most commodities was 1909 to 1914.

Subsequent legislative acts authorized other parts of the Department's action program. These measurements included: the Emergency Farm Mortgage Act of 1933; the Farm Credit Act of 1933; the Federal Farm Mortgage Corporation Act and the Jones-Costigan Sugar Act of 1934; the Soil Conservation Act of 1935; the Soil Conservation and Domestic Allotment Act, the Rural Electrification Act, and the Flood Control Act of 1936; the Agricultural Marketing Agreement legislation; the act placing functions of the Federal Surplus Commodities Corporation in the Department; the Bankhead-Jones Farm Tenant Act; the Norris-Doxey farm forestry legislation; the Pope-Jones water-facilities legislation; and the Sugar Act of 1937; the marketing-agreements and surplus-diversion programs, authorized in 1937-38; and the Flood Control Act, the Agricultural Adjustment Act, and the Federal Crop Insurance Act of 1938.

ALASKA. The territory of Alaska lies in the far

northwest corner of the North American continent and includes the Aleutian Islands which extend westward more than 1,200 miles toward the Kamchatka Peninsula. The area of Alaska, inclusive of inland waters, is approximately 586,400 square miles or approximately one-fifth the area of continental United States. Three-fourths of Alaska is in the North Temperate Zone.

Government and Political Status. Although Alaska was purchased from Russia in 1867 for \$7,200,000 it did not become an "incorporated Territory" until 1912 when Congress passed an "Organic Act" creating the Territory of Alaska. Under its terms the Territory does not merely belong to the United States, but is a part thereof. The Constitution and laws of the United States are automatically in force with the exception of certain provisions which are clearly not applicable. The head of the Territorial Government is Governor Ernest Gruening who was appointed by the late President, F. D. Roosevelt in 1939 for a four-year term, which has since been renewed. In addition, there is a Territorial Legislature which meets for a period of 60 days biennially beginning with the fourth Monday in January of uneven years. Commencing with the 1945 session the number of members in this body has been increased to include 16 senators and 24 representatives. A delegate (Edward L. Bartlett) is elected by Alaskans every two years to represent Alaska in the U.S. Congress. He is empowered to prepare and introduce legislation, and act as a member of Committees, even though he has no vote. The administration and supervision of such functions as health, welfare, education of natives, expenses of the legislature, and judiciary, has not been delegated to the local government, but has remained a Federal function. There are as many as 50 Federal agencies participating in the management of Alaska's affairs.

Events, 1945. Interest in Alaska has been greatly stimulated since the realization of its importance as an outpost for national defense through its "discovery" by the hundreds of thousands of servicemen and civilians who have been stationed there during the war, and by others who are looking for adventure, free land, and the opportunity to make a fortune in America's last frontier. More than 3,000 letters a month have been received by the U.S. General Land Office from veterans who are anxious to learn about the possibilities for settlement and homesteading. Of great interest to prospective settlers is the fact that only 2,321,000 out of 365,841,000 acres have been surveyed. Thus many of them feel that the natural wealth of Alaska has only been sampled but not thoroughly appraised.

Accompanying this renewed interest in Alaskan settlement and colonization, is the agitation for granting Statehood to the Territory. In the early part of the year the Alaskan Legislature provided for a referendum being taken in the fall of 1946 at the general election on the question of Statehood. Mr. Bartlett, the Territorial Delegate, introduced a bill in the U.S. House of Representatives which provides for Alaska becoming a State. President Truman and Secretary Ickes are supporting this bill for they both feel that Statehood would speed the development of Alaska's resources and encourage settlement. Representatives Johnson (D) of Oklahoma and Rooney (D) of New York, members of the Congressional Subcommittee on Interior Department Affairs of the General Appropriations Committee, who visited Alaska during the summer, believe that the people of Alaska are not ready for Statehood or capable of governing themselves.

Moreover they believe that absentee owners of the fishing and mining industries exert too much influence in the Legislature and are responsible for the absence of territorial taxes on personal and corporate incomes, property, gasoline, and banks, thus enabling them to spend only \$1,000,000 out of \$60,000,000 annually toward the economic development and betterment of Alaska. As a result of this liberal tax policy, the Federal Government is the main contributor towards health, schools, and roads.

In spite of these claims of immaturity and incompetence, the Alaskan Legislature passed an Equal Rights bill which should prove to be a significant step in Alaskan history. It provides that "all citizens of Alaska shall be entitled to the full enjoyment of accommodations, advantages, and facilities of any public place." In accordance with this law, no person shall display any printed or written signs indicating a discrimination on racial grounds of such full and equal enjoyment. Violation of this law would bring a jail sentence of three months and a fine of \$250. The Legislature which passed this bill included two full-blooded Indians among its membership.

Seabees, numbering about 200, began drilling for oil on the first test well, within the Arctic Circle, at Umiat on the Colville River, 180 miles from Pt. Barrow (1,100 miles from the North Pole). About 35,000 square miles are involved in this project which is known as Naval Reserve No. 4. With the cessation of hostilities numerous projects are being abandoned in Alaska as war casualties or white elephants. The Alcan highway, which totalled 1,700 miles of roadway and cost the War Department approximately \$50,000,000, and the shipping base at Excursion Inlet, 65 miles southwest of Juneau, which cost \$17,000,000 were given much publicity.

Population. According to the 1940 census the population of Alaska was 72,524 of which whites numbered 40,066 and natives (Indians and Eskimos) 32,458. Eskimos accounted for 15,576, Indians for 11,283 and Aleuts for 5,599. The population of Alaska in 1945, excluding members of the armed forces, was estimated at 85,000. Juneau, the capital of Alaska, had a population of 5,729 in 1940.

Education. Alaska has two school systems, one for white children and those of mixed blood, called the Territorial Schools, and the other for natives (Indians and Eskimos) known as the Native Schools. In the case of the former the Territory has full responsibility for the control, administration, and financing of education whereas in the latter the Federal Government, through the Office of Indian Affairs, assumes the educational burden. The University of Alaska, founded in 1922, had a total of 894 students enrolled in 1943-44. There were 12,019 students enrolled in the primary and secondary schools during 1943.

The Economy. The leading industries of Alaska in order of their importance are fishing, mining, and fur farming. The value of manufactured fishery products in 1943 was \$66,516,217. Salmon fishing and packing account for 80 percent of the people employed in Alaska. The normal annual salmon pack for Alaska runs 6,000,000 cases (of 48 one-lb. cans). Alaska alone accounts for 60 percent of the world's supply of salmon. There are about 100 canneries devoted to this industry and they employ about 20,000 laborers. The center of the salmon industry is Ketchikan. Other fish caught in Alaskan waters and marketed commercially are herring, halibut, crabs, etc.

Mining which ranks second in importance as an industry has been seriously curtailed during World War II. The average annual output of mineral resources during 1939-1942 was \$25,000,000. In 1943 there was a decline in mineral production to \$9,326,000. Gold, the leading mineral export, ranks second to salmon exports, but in 1943 gold mining was seriously curtailed and only \$3,485,405 produced in contrast with \$17,000,000 (1942) and \$24,000,000 (1941). Other minerals mined in Alaska include coal, mercury, silver, copper, lead, and platinum.

Alaska's third leading industry is fur farming and the sale of furs derived from trapping. The production of furs during 1944 amounted to \$1,700,000. Mink pelts and sealskins are the two leading products. The Pribilof Islands account for 85 percent of the world's supply of sealskins.

Commerce and Foreign Trade. The total commerce between the United States and Alaska since 1867 has been estimated to exceed \$3,400,000,000, with minerals accounting for approximately \$830,000,000. Exports of Alaskan products to the United States from 1942 to 1944 totaled \$56,000,000, \$70,000,000, and \$68,000,000 respectively. Canned salmon accounted for \$46,000,000, \$52,000,000, and \$50,000,000 or 76 percent of the total export trade. Other fresh or frozen fish products, such as halibut, salmon, cod, and herring, accounted for approximately 14 percent, with furs and skins and gold bullion accounting for the greater portion of the remaining 10 percent. Imports from the United States by Alaska totaled \$89,000,000, \$74,000,000 and \$64,000,000, respectively. The principal imports were vegetable food products, beverages, machinery, vehicles, metals, and manufactured goods.

Agriculture. The three principal farming areas in Alaska are located in the Kenai Peninsula (Homer Area), Tanana Valley (near Fairbanks), and the Matanuska Colony (near Palmer). The products grown are largely for local consumption, i.e. grains, vegetables, foodstuffs, livestock, dairying, poultry, and hog raising. All crops common to North America also thrive except corn, tomatoes, and orchard fruits. One of the most interesting experiments in agricultural colonization ever undertaken under Government sponsorship is the Matanuska Valley Colonization Project, fifty miles from Anchorage at the head of Cook Inlet. Of the 200 families who in May, 1935, migrated from Minnesota, Wisconsin, and Michigan only 58 remained throughout the initial period of hard toil and little return. To date approximately 7,000 acres have been cleared under trying conditions, but there have been good results for potatoes, lettuce, cabbage, etc., which are moved to Alaskan cities in carloads. The U.S. Army, particularly Fort Richardson which is located at Anchorage, purchased \$750,000 in produce from Alaskan farmers during 1943. The growing season in Alaska lasts for about 115 days.

Livestock. Reindeer outnumber all other types of livestock raised in Alaska. In 1944, there were 170,000 head of reindeer of which two-thirds were owned by Indians and Eskimos. This industry is administered by the Office of Indian Affairs, in the Department of the Interior, primarily for the benefit of Alaska's natives. Other livestock include horses, cattle, hogs, and poultry.

CHARLES F. REID.

ALBANIA. A Balkan country on the east shore of the Adriatic Sea. Area: 10,629 square miles. Population: 1,083,000 (Jan. 1, 1940). Chief towns:

Tirana (capital), 30,806 inhabitants in 1930; Scutari (Shkodër), 29,209; Koritsa (Korçë), 22,787; Elbasan, 13,796; Durazzo (Durrës), the chief port, 8,739.

Education and Religion. Primary education is nominally compulsory, but illiteracy remains high. The population, by religions, included 688,220 Moslems, 210,313 Orthodox Christians, and 104,184 Roman Catholics.

Production, etc. Albania's chief products are corn, wheat, tobacco, olive oil, wool, petroleum, timber, hides, dairy products, and fish. There are deposits, still largely unexplored, of copper, chrome, and other minerals.

Transportation. The highway network extended 1,759 miles in 1940 (750 miles suitable for motor traffic), but this was badly disrupted by war in 1940-41. Construction of a railway between Durazzo and Elbasan, the first line in Albania, was begun in May, 1940.

Events, 1945. The central fact in the history of Albania in 1945 was the recognition accorded by the governments of Great Britain, the United States, and Russia on November 10 to Enver Hoxha's provisional government, which was an outgrowth of the Albanian resistance movement, called, since early 1944, FNC (Fronti Nacional Chirmtare). The movement was organized in September, 1942, as LNC (Levizje Nacional Chirmtare) to unite all resistance groups, irrespective of religious, political, or social issues. In time the more conservative, nationalist, and for the most part, propertied groups withdrew and were drawn into collaboration with the Germans. By 1944 LNC (soon changed to FNC) was the only active resistance movement in Albania, was clearly dominated by the Communist Party, and was strongly opposed by all other organized Albanian groups. Of these the chief was the Balli Kombetar, which objected to FNC's Communist leadership and Yugoslav Partisan connections.

In October, 1944, FNC had requested recognition by the Allies. The request was made more strongly in January, 1945, and repeated at intervals during the year, but the British seemed loath to alter their earlier attitude of suspicion of FNC and their policy of checking it by encouraging opposition. It was apparently thought that the strong Russian influence in Albania could be counterbalanced by the ML (Military Liaison) and UNRRA programs, but FNC showed suspicion of the great numbers and personnel of ML and UNRRA missions in Albania.

In March Brigadier Hodgson and a British Military Mission arrived in Albania, and in May the American observers whom Secretary Stettinius had agreed to send in March, but these missions did not imply recognition of FNC as a legitimate government. At first the British showed some enthusiasm for the FNC regime, but their later reports declared that it was high-handed and opposed by a considerable section of the people. The ML agreement concluded by Generals Hughes (Great Britain) and Sadler (United States) on April 11 marked a concession to FNC, but there were still grounds for suspicion. For example, the chief of the UNRRA mission to Albania was Major Oakley Hill, who had previously been British liaison officer to Abas Kupa, head of the Albanian opposition to FNC, and before that inspector of the Zogist gendarmerie. At the trials, held on March 1, of Bari Omari and Kol Tomara, leaders of the anti-FNC Balli Kombetar and former members of the German-sponsored Mitrovits cabinet, the chief defense was that the accused had been following

the instructions of the British. More important figures in Balli Kombetar, such as Abas Kupa himself, Mithat Frasheri, and Mehdi Frasheri, had either been evacuated by the British or had retreated with the Germans and had not been turned over to the Albanians for trial. Britain refused a request for the custody of Xhaver Deva, who had been responsible for the arrest and execution of a number of FNC sympathizers at the hands of the Germans. Abas Kupa, whom the British had taken to Bari, had gone to Cairo, where he was spreading rumors concerning the formation of a Zogist government with British support. The British suppression of the EAM uprising in Greece added to FNC suspicions, and when, upon conclusion of the Greek uprising by the Varkiza Agreement of February 12, the Rightist Greek press opened a campaign for the accession of Southern Albania, the Albanians were apprehensive that the British might support the Greek claims. FNC was convinced that the British representatives in Albania were sending adverse reports on their regime to London and were giving encouragement to FNC's enemies at home and abroad. In consequence they sharply restricted the movements of British personnel, requiring 48-hour notice and formal permission for any journey. At the end of June ML's decision to withdraw from Albania precipitated the disagreement between UNRRA, represented by Major Oakley Hill, and Enver Hoxha. The latter maintained that he should sign the agreement as the head of the Albanian state, and not, as Hill insisted, merely as commander-in-chief of the armed forces. Hoxha also wished UNRRA personnel to be limited to twelve, fearing that a larger number would devote themselves to British intelligence rather than to UNRRA work. Major Hill's position was that so small a number would not be able to assure that UNRRA supplies were not being put to military use or shipped to Yugoslavia. The impasse was solved by a compromise reached in September.

With Russia and with Yugoslavia, on the other hand, FNC's relations were most cordial. The greatest potential source for dissension with Yugoslavia, the question of the disposition of the Kosovo region, was settled by an amicable agreement reached in February whereby the region was to become an autonomous unit within federated Yugoslavia. The area, comprising some 12,600 square miles along the prewar Albanian-Yugoslav frontier, with a population of some 600,000, had long been the object of rival nationalist claims. Before the war it formed part of Yugoslavia, and though the Yugoslavs made strong efforts to colonize it, its population continued predominantly Albanian. In 1941, after the Axis invasion, the Kosovo region was annexed to Albania; and the Italians and Germans exploited the nationalist feelings of the Albanians in the area, so that FNC, because of its Communist leadership and its connection with Tito, was disliked. FNC forces moved into the region late in 1944 and were soon joined by Yugoslav troops, which were in effective control by early 1945. In July the Yugoslav government proclaimed the reincorporation of the Kosovo region, the south portion in the Yugoslav federal unit of Macedonia, the Kosovo-Metohiya area in the unit of Serbia, and the northwest portion in the unit of Montenegro. An acceptance of this action without public protest is a measure of the close relations subsisting between the regimes of Albania and Yugoslavia. Both governments are cooperating in a program designed to minimize frictions. Local government has been established on a joint

proportional basis; Albanian schools and newspapers are functioning; and an agrarian reform measure tends to bar the return of Serb colonists as well as divide large estates among the permanent residents. FNC's acquiescence has subjected it to criticism that it has betrayed Albanian national interests, and armed revolts against Yugoslav rule on the part of the Kosovars have been reported. But if the present harmony between the regimes continues, and if the final intention of the regimes is the creation of a Balkan federation (for which, indeed, the present solution of the Kosovo question is the best evidence), the tensions in the area will doubtless subside.

Relations with Russia have been as cordial as those with Great Britain were strained; FNC has received praise and encouragement from Russian propaganda agencies and has openly admired Russia and its institutions. Russia sent a military mission to Tirana in April, which served in lieu of recognition, and an Albanian military mission was received in Moscow, though London and Washington refused to accept Albanian military missions. During the summer two high-ranking members of the FNC's Communist inner circle, Koci Xoxe, chief of the FNC special police, and Bedri Spahiu, Minister of Social Welfare, were conferring with Soviet authorities in Moscow, and later a delegation of Albanian anti-fascist youth was fêted there. A Russian propaganda exhibition was opened in Tirana, and Russian correspondents and news photographers have been active in Albania. *Red Star* for September 21 published a long and laudatory article on Albania, approving FNC's record and its plans. Russian correspondents have also supported Albania against the territorial designs of Greek "fascists." Albania seems clearly to be moving into the Russian sphere and will probably be able to count on Russian support in any border dispute with Greece. Though Hoxha's petition to the Big Three on September 4 to afford Albania an opportunity to present its claims to the Council of Foreign Ministers went unheeded, Molotov's attack on the Greek regime was tantamount to a defense of Albania.

In the course of the year FNC has taken various steps to transform its provisional into a regular government. The position of Hoxha and his ministers was that all Albanians are automatically members of FNC; new political groups must therefore originate in FNC. Within FNC such non-communist leaders as Myshin Peza and Baba Faya Marteneshi enjoyed a certain popularity, but possessed neither acumen nor program for starting an effective opposition. In all government bureaus FNC exercised political control through the *pergegjes*, a species of political commissar. A well-attended and enthusiastic congress of FNC at Tirana during the first half of August was a step towards forming a regular government. On September 25 the National Liberation Council, the provisional governing body of Albania, discussed plans for a constituent assembly, and in October it was announced that elections would be held in December. As in Yugoslavia and Bulgaria, the franchise was given not only to women but to all over eighteen; only persons mentally deficient or who have forfeited the rights of citizenship, presumably by collaboration with the enemy, may not vote or be elected. In view of FNC's control of army, gendarmerie, and administration, and the enthusiastic support of well-organized women's and youth groups, FNC's success at the elections was as complete as had been generally expected.

The internal program announced by FNC is

moderate, in view of its leftist professions, the chief objects being to end exploitation by foreign capital and by native "feudalism." Concessions granted by former regimes to foreigners for exploitation of surface and subsurface soil were annulled, as was financial control by Italian banks. Mines and refineries were put under government administration. Agrarian reforms envisaged the distribution of large estates and properties of collaborators to peasants, so that none should be without his own land. Taxes were to be direct, and especially heavy on those who were enriched by the war. Veterans were to receive benefits, but Zogist pensions for useless clients were cancelled. The welfare of the people was to be the prime concern of the government, but private property and private enterprise were to be respected and guaranteed. A degree of moderation was shown also in the penalties meted out to collaborators at trials held in April. Of sixty defendants two were acquitted, twenty-three received death sentences, and the rest prison terms. The defendants pleaded that they were motivated by abhorrence of communism, by encouragement of British liaison officers, by a conviction that resistance would bring destruction upon Albania without materially aiding the Allies, and by despair at the earlier betrayal of small countries by England and France.

ALIEN PROPERTY CUSTODIAN. Office of. A war agency within the Office for Emergency Management, established by executive order of Mar. 11, 1942. The Alien Property Custodian has the power to direct, manage, supervise, control, or vest property of nationals of enemy or enemy-occupied countries.

The Office has taken title to more than 44,000 patents and patent applications formerly owned by nationals of enemy countries and enemy-occupied territories. The liquidation of vested property, except patents, is being effected through a program of public sales. The patents are being licensed to American industry, as applications are received, on a nonexclusive, royalty-free basis for the life of the patent. Alien Property Custodian: James E. Markham.

ALSACE-LORRAINE. The two border provinces annexed by Germany after the Franco-Prussian War and returned to France by the Versailles Treaty (June 29, 1919). They were reoccupied by German troops in June, 1940, and placed under German civil administration on or about Nov. 30, 1940. Area, 5,605 square miles; population (1936 census), 1,915,627. Lorraine was merged with the Saar district (Saarpfalz) to form the German province of Westmark. The provinces were occupied by Allied armed forces in 1944 and returned to France where they comprise the following departments: Bas-Rhin (1,848 sq. mi.; pop. 711,830), Haut-Rhin (1,354 sq. mi.; pop. 507,551), and Moselle (2,403 sq. mi.; pop. 696,246).

ALUMINUM. Declining military aircraft production and other war demands caused a drop in United States primary aluminum production to about 1,000,000,000 lb. in 1945, (1944, 1,552,892,000 lb.). During the war nearly two-thirds of total aluminum production had been used by the aircraft industry.

This sharp drop in demand and the end of the war left the United States with an annual metal-making capacity of 2,350,609,000 lb., over one-half of it owned by the federal government. Disposal of large surplus government-owned plants

constituted a problem which had not been completely solved at the end of the year. The Surplus Property Board, later succeeded by a single administrator, was restricted in formulating a disposal program by a final court ruling that the Aluminum Co. of America (Alcoa) had as of 1940 had a monopoly on the production of aluminum ingot in violation of the Sherman Act. The Court, sitting as a court of last resort, also indicated that the success of the plant disposal program in fostering competition within the industry would be "at least one condition as to the propriety of dissolution" of Alcoa. Of privately owned annual production capacity totalling 989,857,000 lb., Alcoa holds 828,127,000 lb. and Reynolds Metals Co., a new producer in 1941, 161,730,000 lb. The government plants have a total annual capacity of 1,360,752,000 lb. of which, during the war, Alcoa was charged with operation of 1,320,564,000 lb. and Olin Corp. 40,188,000 lb.

The process of making metallic aluminum involves the mining of bauxite ore ($\text{Al}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$), converting it to alumina (Al_2O_3), and reducing the alumina to metallic aluminum. Most bauxite is imported, principally from Dutch Guiana, but lower grade ore is available in limited quantity from Arkansas deposits. The key unit in the surplus plant disposal program was indicated by the Surplus Property Board to be a large alumina plant located close to the Arkansas deposits at Hurricane Creek. When the war ended the government had built up a bauxite stockpile there which, with new locally mined ore, could tide a new aluminum producer over for eight or ten years until foreign sources could be arranged. In December the government leased the Hurricane Creek alumina plant and the Jones Mills, Ark., aluminum reduction plant, located 20 miles away, to Reynolds Metals Co. Reynolds, whose lease runs for five years, agreed to sell alumina produced at Hurricane Creek above its own needs to other aluminum producers at cost plus 6 per cent.

Of the seven remaining government owned aluminum metal plants, the Surplus Property Board saw little hope of leasing or selling more than two, located at Troutdale, Ore., and Spokane, Wash., respectively. Reynolds has indicated interest in these plants also. During the war, only the Jones Mills, Troutdale and Spokane plants had production costs below the current market price of 14 cents per pounds for aluminum pig.

Lack of interest in acquiring the plants, prospective operators said, lay in high operating costs of the government plants in relation to shrunken postwar markets for aluminum at present prices. Reduction in aluminum metal prices was acknowledged by the Surplus Property Board, itself, to be necessary to develop fully markets for the metal in the automobile, railroad, truck, construction, and manufacturing fields in competition with such metals as steel selling for less than one-fifth as much per pound. The established competitive position of Alcoa and the Aluminum Company of Canada, which operates the world's largest aluminum plant in Quebec, also deterred bidding on the surplus American plants, testimony indicated.

In addition to its primary metal plants and fabricating plants, representing an investment of \$739,000,000, the government faced the problem of disposing of nearly 1,500,000,000 lb. of aluminum scrap resulting from the war. Close to 1,000,000,000 lb. will come from wrecked and obsolete aircraft, 70 per cent of whose weight is aluminum. Use of much of this wartime scrap is limited by its high alloy content of other metals, which restricts

its principal field of use, when melted down, to castings and extrusions.

Stocks of primary aluminum metal held by the government through Reconstruction Finance Corporation were, as of Oct. 31, 1945, 385,140,355 lb., and of secondary (remelted scrap) metal 6,223,108 lb.

At the end of 1944, the United States had 41.6 per cent of world aluminum capacity; Canada, 19.8 per cent; Germany, 9.7 per cent; Japanese empire, 7.5 per cent; France, 4.4 per cent; Austria, 4.1 per cent; Russia, 2.9 per cent; Italy, 2.5 per cent; British Isles, 2.2 per cent.

AMERICAN LEGION. The. An organization of American veterans of both World Wars I and II. It became a two-war organization, Oct. 29, 1942, when President Roosevelt signed Public Act 767, making honorably discharged veterans of World War II eligible for membership. By the close of 1945 more than 600,000 World War II veterans had enrolled. The 27th national convention in Chicago, Illinois, Nov. 18 to 21, 1945, remained a streamlined affair

because of transportation and housing conditions, with official attendance restricted to 2,032 delegates and to national officers and key committeemen. The outstanding declaration of the convention was the formulation of a specific American Legion plan of universal training for national security. It provided for a year's military training for all young men between the ages of 18 and 20 years, to be divided into two periods. The first period called for four months of basic training. The trainee then would have several options for completing the remainder of the required training or its equivalent: (1) to go on to college and train with the ROTC; (2) to continue with his business career and enlist in the National Guard for three years, or a functioning unit of the organized reserves; (3) to be elected, if qualified, for advanced technical or scientific training which might be given in the armed forces, in special Army or Navy schools or other institutions especially selected where certain courses are given under Army or Navy direction, or in industry where special schools have been provided; (4) to volunteer for a term of enlistment in the Regular Army, Navy or Marine Corps; or (5) to complete a year of training with the armed forces as provided by those forces.

The national executive committee in Indianapolis, Dec. 13 to 15, 1945 designated the major legislative program of The American Legion to be (1) the problems of rehabilitation, hospitalization and service to the returning veterans, particularly those suffering from disability or sickness; (2) the problems of economic reestablishment of veterans and their re-integration into community life, with particular stress on employment and housing; and (3) a sound military defense program in which "universal military training of the youth of this republic shall be a basic part."

War Effort. Accomplishments in 1945 included sales in Legion drives of hundreds of millions of dollars worth of war and victory bonds, record collections of waste paper, scrap metals, and other vital materials; and promotion of blood banks.

Special services to armed forces included distribution of phonograph records, playing cards, booklets, hospitality cards, and hometown newspapers. The American Legion collected more than 1,300,000 gifts for hospitalized servicemen and veterans through its nation-wide "Gifts for Yanks Who Gave" Christmas program.

Rehabilitation. Chief accomplishment in this field was the liberalization of the Legion G.I. Bill of Rights for World War II veterans, through Legion-sponsored amendments providing increased benefits and reducing much of the administrative red tape which hampered operations of the law; and a vast expansion of the Legion's rehabilitation service machinery, on the State levels as well as nationally, to render every possible assistance to returning veterans, particularly the disabled.

Child Welfare. There was further expansion of Legion aids and services to children of World War II veterans and a great increase in the Legion's child welfare machinery.

Internal Organization. During 1945 the Legion modernized its publicity machinery through the establishment of a new national division of public relations with adequate press, radio, movie, and magazine staffs backed by a 1946 budget of more than \$333,000. Branch offices are in Washington, D.C., New York City, and Los Angeles.

During 1945 the Legion reached a new high in membership, exceeding the previous record by 241,819. On December 31, 1945, there were 1,667,742 members. Posts numbered 13,041, a gain of

800. The Auxiliary also reached a new peak of 634,822, for a gain of 62,412. Units numbered 9,765. The Sons of The American Legion closed the year with 46,258 members in 3,488 squadrons. The Forty and Eight established a new record with 64,016 members in 750 voitures. The Eight and Forty climbed to 10,132 in 294 salons.

The American Legion has two national publications, *The American Legion Magazine* and *The National Legionnaire*, with combined circulations of more than 3,335,000, as well as approximately 300 weekly, semi-monthly, and monthly State, district, county, and post news organs. The national public relations division issues a weekly American Legion news clip sheet going to a mailing list of some 20,000 daily, weekly, radio, labor, and college publications.

National Commander for 1945-46: John Stelle of McLeansboro, Illinois. National headquarters are at 777 North Meridian Street, Indianapolis, 6, Indiana. Legislative, rehabilitation, and employment director offices are maintained in the Legion-owned building at 1608 K Street, N.W., Washington, D.C.

ANDORRA. A small republic in the Pyrenees between France and Spain, under the joint suzerainty of the French chief executive and the Spanish Bishop of Urgel. Area, 191 square miles; population, about 6,000. Capital town, Andorra. The language spoken is Catalan. Sheep rearing is the main occupation of the people. There is a governing body called the council-general consisting of 24 members elected for 4 years (12 elected every 2 years). The council-general nominates the First Syndic (President) and Second Syndic (Vice-President).

ANGLO-EGYPTIAN SUDAN. A territory under British-Egyptian condominium in northeast Africa, lying south of Egypt in the middle and upper watershed of the Nile River. Area, 967,500 sq. mi. approximately (some of the frontier has not been delimited exactly). Capital, Khartoum.

Government. Sovereignty is shared between Great Britain and Egypt, a fact symbolized by flying the flags of the two countries together over public buildings. The Governor-General is nominally an appointee of the Egyptian Government but is in practice an important British civil or military personage. Other high officials are also British, though in recent years more Sudanese have been admitted to the lower administration (4,020 of them were in such posts in 1944). Assisting the Governor-General there is a Council for the whole area, and for the Northern Sudan an Advisory Council (set up in 1943) of local dignitaries for consultation. The southern Sudan is not regarded as sufficiently advanced politically for representative institutions. The judicial system makes provision for Mohammedan courts where Moslem law is applied. The country's defense is entrusted to the Sudan Defense Force. Units of this body participated in the reconquest of Ethiopia in 1941.

Events, 1945. The year was marked by continued Egyptian agitation for the annexation of the Sudan, as in the communiqué issued by the Nokrashi Cabinet in Alexandria on Sept. 23. Apparently the Egyptian Government was anxious lest the rise of Sudanese nationalism sever the ties binding the two countries. Egypt also put forth a claim for the Italian colony of Eritrea—to be annexed to the Sudan—in a statement made by Foreign Minister Abdul Hamid Badawi Pasha on Sept. 25.

During the May session of the Northern Sudan

Advisory Council the Governor-General announced a twenty-year plan to increase educational facilities so that Sudanese can eventually reach the top of the administrative ladder. In February an important step had been taken in this direction when Gordon College in Khartoum (founded in 1902) became independent of the government and subject to its own ruling body. The next step will be to make it a university college. Its faculty, British and Egyptian, has as its object the creation of such a Sudanese University from which can come the men who will make Sudanese self-government a reality.

The Population and Its Economy. Estimates of the population vary from 6,000,000 upward. In the northern, or open, part of the country the population is Arabized and Moslem; in the south it is largely pagan and more truly African in culture and race. Important centers are Khartoum, Omdurman, Wadi Halfa, Port Sudan (on the Red Sea), Kassala, El Obeid and El Fasher.

Some four-fifths of the world's gum arabic comes from the Sudan (exports in 1938: 23,989 tons). High-grade cotton is produced in increasing quantities: over 400,000 acres under cultivation in 1941-2, from which 60,000 tons were exported. More than half of this acreage is in the Gezira Irrigation Scheme, to be taken over by the Government in 1950. Other vast producing areas merely await the construction of dams and irrigation systems. Livestock statistics for 1944 were: 3,195,000 cattle; 4,808,000 sheep, 3,991,000 goats; 1,109,000 camels. There is little mining or lumbering and almost no industry. Communications are afforded by government steamers on the Nile and its tributaries, some 2,000 miles of railroad and a meager highway system.

ROBERT GALE WOOLBERT.

ANIMAL INDUSTRY, Bureau of. A Bureau of the U.S. Department of Agriculture, established in 1884, which deals with the eradication and control of animal diseases and parasites, conducts research on the production of livestock and their products, and otherwise seeks to protect and develop the livestock, meat, poultry, and related industries. During the war the Bureau furnished consultants and otherwise assisted in plans for providing adequate supplies of meat, wool, and other animal products needed by military services and lend-lease agencies. Chief: A. W. Miller.

ANTI-NARCOTICS LEAGUE. The international control of the dangerous drug traffic which the League of Nations had developed highly after World War I seemed during 1945 to be the League activity best surviving World War II. The Permanent Central Opium Board stated, in an over-all Report, that, "broadly speaking, the direct control set up by the International Conventions has withstood the shock of war and most governments have supported the international control to a remarkable degree."

Substitution of the United Nations for the League of Nations, however, presented certain difficulties. The American Delegation at the San Francisco Conference, stressing the importance of the anti-drug work, urged that "everything be done to safeguard its continuing operation" through the United Nations. The Preparatory Commission was given instructions in this sense, which the Central Board immediately noted "with great satisfaction" and with certain specific suggestions. Shortly after, the Executive Committee in London drew up detailed recommendations with a view to final action by the First Assembly in January. All this gave

vitality to the Central Board's hope that there be "no break or hiatus" in the transfer from the League to the United Nations.

Meanwhile, the daily work continued. The Central Board met in London as usual in war-years but the Branch Office which had functioned successfully in Washington since 1940 was returned to Geneva pending final arrangements. Information was received from 49 countries and 66 territories; the regular reports were issued; several new ratifications were received; and, most notable single event, France notified the League of the "absolute prohibition of opium-smoking in all territories of the Far East under French authority," primarily French Indo-China.

ARTHUR SWEETSER.

ANTITRUST DIVISION. A Division of the U.S. Department of Justice charged with the enforcement of the antitrust and 30 kindred acts. The Division receives complaints and, in cooperation with the Federal Bureau of Investigation, conducts investigations which, where appropriate, lead to criminal prosecutions or suits in equity designed to break up monopolies, restraints of trade, cartels, agreements with foreign corporations, and restrictive patent arrangements. The Small Business Section of the Division receives complaints and appeals for help from small business concerns throughout the country and, when justified, represents their interests before other Government agencies. If the investigation indicates a violation of the antitrust laws, this Section recommends appropriate action by the Division. Assistant Attorney General in charge: Wendell Berge.

AQUEDUCTS. Canals, pipes, conduits and tunnels are included in aqueducts which are features of important postwar projects for municipal and industrial water supply, irrigation and hydroelectric developments. For the water supply of San Diego, Calif., and the adjacent U. S. Naval Station a 72-mile aqueduct is being built to bring Colorado River water from a connection with the existing aqueduct of the Metropolitan Water District of Southern California to the city's new San Vicente reservoir. It will be 42 to 93 in. in diameter, and is to be completed in 1947. Its cost will be divided between the city and the U. S. Navy. In 1939 San Diego had a civil population of 197,000 and military population of 17,500; under war conditions these figures were increased to 360,000 and 100,000, respectively.

On the Owens River aqueduct of the above District, steel siphons 10 ft. in diameter were reinforced by ring girders and additional supports. Portland, Ore., plans a 36-inch pipe line from the Mt. Tabor reservoir to the city; Denver has started a 23-mile tunnel through the Continental Divide to bring an additional water supply from the Pacific slope, and Saginaw, Mich., plans a 70-mile aqueduct from Lake Huron.

An aqueduct of exceptional length is to bring Colorado River water for irrigation on the elevated plateau of Arizona, surrounding Phoenix. Three plans are being studied: (A) from the Marble Gorge, near the Grand Canyon, with 140 miles of tunnel to a series of power plants; (B) from the Bridge Canyon, above Boulder Dam, with 72 miles of tunnel to the Cunningham reservoir and then 260 miles of canal; (C) pumping water from the Parker Dam up 1040 ft. to the above reservoir and its canals. On the Deschutes Irrigation project, in Oregon, a concrete arch bridge carries a box flume or conduit across the Crooked River,

the top of the flume forming a road. Numerous aqueducts are included in projects of the U. S. Bureau of Reclamation.

In the Union of South Africa, the government plans a 50-mile irrigation aqueduct from the Orange River, at Bethulie, to the Brak River. The city of Cape Town, faced with a water shortage, plans a third pipe from the Steenbras reservoir. The city of Mexico, also with a water shortage, expects to complete in 1946 its 35-mile Lerma aqueduct, with 10 miles of tunnel.

Pipe-line projects are active for conveying oil, oil products, gasoline and natural gas. But the U. S. Government will sell some of the long steel pipe lines built for war service when the submarine was a hazard to tanker navigation. Among those to be sold are the "Big Inch" and "Little Big Inch" lines from Texas to points on the Atlantic seaboard.

Amazing in conception, construction and operation were the multiple pipe lines built by American and British army engineers from England to France to supply the mechanized troops in the great invasion. Four lines of 3-in. pipe were laid from the Isle of Wight to Cherbourg, and 20 lines from Dungeness to Boulogne. The flexible pipes were wound upon floating steel drums 40 ft. long and 40 ft. diameter, which were towed across the water, unwinding as they went. Another method was to lay the pipe from a cable-laying steamer.

During the war a secret pipe line was built across the Isthmus of Panama to serve the Pacific fleet in case of damage to the Panama Canal. It had two 20-in. lines for fuel oil, a 12-in. line for gasoline, and a 10-in. line for diesel oil. Extension to Fairbanks of the Canol oil pipe line built in Alaska and Canada by the U. S. Army, was halted in June, because of improved military conditions and the elimination of the submarine hazard in the Pacific Ocean. Begun in 1942, it runs 600 miles from the Mackenzie River to refineries at White Horse (Yukon), with distribution lines 110 miles to Skagway, 587 miles to Fairbanks, and 266 miles to Watson Lake. Canada has an option to purchase its part of the line, and the United States has the right to purchase a certain amount of oil.

An 1800-mile line from Calcutta, India, to Kunming, China, was completed in April, to serve mechanized equipment on the Assam-Burma-China war front. A curious development was the use of bamboo instead of small metal pipe in lengths of 15 to 20 ft. The first natural-gas pipe line in Russia is being built from Saratov, in the Urals, to Moscow, 500 miles away, and will be equipped with American machinery. Russia is building an oil line from Constanta, Roumania, to Odessa on the Black Sea, as an extension of the existing line from oil fields to Constanta. Steel pipe has been ordered to duplicate the present line across Iraq, and a line from the Persian Gulf to the Mediterranean, backed by American interests, will avoid the heavy tolls on tankers using the Suez Canal.

See DAMS, TUNNELS, WATER SUPPLY.

E. E. RUSSELL TRATMAN.

ARABIA. A large peninsula in southwestern Asia. Area, approximately 1,000,000 sq. mi.; population, upwards of 10,000,000. The political subdivisions are treated separately below. Other countries in the Near East with Arab-speaking populations, but not included under the heading "Arabia," are Egypt, Iraq, Lebanon, Palestine, Syria and Trans-Jordan. The various parts of Arabia may be divided into two broad political categories: independent

states, and territories under British sovereignty, protection or influence.

They are all inhabited by almost solidly Moslem populations, though of diverse sects. The ancient Arab stock, still overwhelmingly predominant in the interior, has been diluted with African, Indian, Iranian and other elements along the coasts. Nomadism has diminished greatly in recent decades, even in the desert interior, and today the population is largely sedentary. Education is still largely religious in nature and confined to males, except where British or missionary influence has been felt. Economically the region is probably on the threshold of a renaissance due to the billions of barrels of oil in its subsoil, now in process of exploitation.

The two independent states are Saudi Arabia and the Yemen.

Saudi Arabia. This state occupies the interior desert as well as some of the dry coastal regions on both the Persian Gulf and the Red Sea. It is primarily the creation of its present ruler, King Ibn Saud. Following the First World War he annexed the Kingdom of the Hejaz to his original state of Nejd, thus coming into possession of the Moslem Holy Cities of Mecca and Medina, the pilgrimages to which are in normal times lucrative sources of income. There are two capitals, Mecca and Riyadh. Theoretically there is also a distinction between the governments of the Nejd and Hejaz, since the former is an absolute monarchy while the latter is nominally under a constitution.

The estimated area exceeds 700,000 sq. mi., with a population probably in excess of 5,000,000. There are several cities and even a few seaports, notably Jidda; but by and large the population does not congregate in large urban centers. Various dialects of Arabic are spoken. Ibn Saud and his desert subjects are fanatical followers of the puritanical Wahabi sect. The population is racially not entirely homogeneous, since for many centuries there has been a trade in slaves from Africa that has inevitably introduced considerable Negro blood into many parts of the country.

Saudi Arabia has only recently started to become a part of the world economy through the discovery of large oil resources now being developed by the American-Arabian Oil Co., a subsidiary of the Standard Oil Co. of California and the Texas Oil Co. The royalties from this oil production are being used to construct roads, expand irrigated areas, and in general to open up the country. Both the export and import trades of Saudi Arabia are statistically unimportant except for crude oil. The small production of cereals and animals goes almost exclusively to satisfy the local markets.

Yemen. This country, sometimes referred to as Arabia Felix, contains some 75,000 sq. mi. and a population of around 3,500,000. It is ruled by an hereditary Imam, whose capital is at San'a. Unlike Saudi Arabia, much of the Yemen is high and fairly well watered. Agriculture is carried on extensively, with such crops as barley, wheat, millet, and coffee. Coffee has been the country's principal export, much of it coming out through the port of Mocha.

Until recent years the Yemen has been virtually inaccessible to Europeans, and even today few are allowed to penetrate into the country. In the same way, the Imam has pursued a policy of almost complete isolation from world affairs. However, the Yemen has become a member of the Arab League. The population is Arabic-speaking, with some Negro blood evident here and there. There are also remnants of once important Jewish communities.

Aden. This is the only British crown colony in

Arabia. It is located at the southwestern tip of the peninsula at the entrance to the Red Sea. The city of Aden, the capital, lies some 100 miles east of the Straits of Bab-el-Mandeb. The island of Perim, just north of the Straits forms part of the colony, which has an area of 80 sq. mi. and a population of over 50,000. It is administered by a Governor aided by an Executive Council. There are no representative institutions. The colony produces almost nothing for export, and its sole function in the British imperial scheme is as a naval and supply base along the short route to India. Such commerce as there is consists largely of transit trade. The barren terrain obliges the inhabitants to import even simple foodstuffs from elsewhere. In 1939, 2,004 merchant vessels stopped at Aden, as well as 1,455 local craft. The inhabitants represent a mixture of Arab, Indian, Somali, and other African peoples.

The Aden Protectorate. North and east of the crown colony there extends a vast area of some 120,000 sq. mi., known as the Aden Protectorate. It is largely desertic. The Protectorate is under the general supervision of the Governor of Aden, but the actual administration is left mostly in the hands of the local sultans. The Western Aden Protectorate is comprised of 19 Sultanates, of whom the Sultan of Lahej is the Premier Chief. The Eastern Aden Protectorate encompasses the Hadhramaut (containing the Q'aiti State of Shihr and Mukalla and the Kathiri State of Seiyun), the Mahri Sultanate of Qishn and Socotra, the Wahidi Sultanates of Bir'Ali and Balihaf, and the sheikdoms of 'Irqa and Haura. The population is probably around 600,000, most of which is concentrated in the coastal cities and in the fabulous skyscraper towns nestling in the interior valleys. Many persons of Negro ancestry are encountered in this region. Trade is on a local scale, though some of the more prominent families of the Hadhramaut have acquired fortunes in Malaya and the Dutch East Indies.

Muscat and Oman. Located in the easternmost corner of Arabia, this country is nominally an independent Sultanate. It is, however, definitely within the British sphere of influence, which is predominant throughout Southern Arabia and in the Persian Gulf area. There are more than 82,000 sq. mi. and probably 500,000 inhabitants. Most of these are Arabs, with Indians and Negroes represented in some of the coastal centers. Muscat is the capital, but Matrah is the principal commercial center for what little trade there is in the Sultanate. Most of the country is hot and quite barren, the principal exception being the higher regions around the Jebel Achdar where there is some cultivation. Dates constitute the principal product and export commodity, with rice coming first among the imports. Few vessels call at Muscat and internal communications are of a primitive sort. Few outsiders ever visit the country.

The parts of Arabia within Britain's sphere of influence run a wide gamut of political arrangements.

Trucial Oman. Lying north of Oman along the coast of the Persian Gulf is a relatively small area controlled by six petty rulers known as the Trucial Sheiks. Their external affairs are under the control of Britain, which is represented by a Political Officer and a Residency Agent for the Trucial Coast. Altogether this area contains no more than 100,000 inhabitants.

Qatar. A shiekdom comprising the peninsula of the same name in the Persian Gulf, with a population of probably 30,000 and an area of 8,500 sq. mi.

Its status *vis-à-vis* Great Britain is similar to that of the Trucial Sheiks.

Bahrein Islands. An archipelago in the Persian Gulf off the coast of Saudi Arabia. On Bahrein, the largest of the islands, there are oil wells and refinery installations owned by a subsidiary of the Standard Oil Co. of California and the Texas Company. There is some pearl diving and intensive agriculture, but the chief export is oil products. Bahrein is also the chief outlet for the trade of the neighboring parts of Saudi Arabia. There is a hereditary ruling Sheik who of course leans heavily on the advice of the British Political Agent. The population exceeds 120,000 and includes Persian, European and American communities.

Kuwait. A small territory of less than 2,000 sq. mi. wedged in between Iraq and Saudi Arabia at the northwestern corner of the Persian Gulf. The hereditary Sheik is assisted by an advisory council and a British Political Agent. The population probably exceeds 100,000. Oil was discovered in 1938 and its exploitation will undoubtedly greatly alter conditions here as it did in the Bahrein Islands.

Events, 1945. The outstanding political development of the year in Saudi Arabia was the emergence of that country from its diplomatic isolation. Hitherto Ibn Saud had been rather wary of becoming too closely involved in Pan Arab affairs—an attitude ascribed not only to his natural diffidence but to his jealousy of the reigning monarchs in Egypt, Trans-Jordan, and Iraq. Early in January it was authoritatively stated in Egypt that the Arabian King had decided actively to support the other Moslem states in the Near East in the organization of the Pan Arab League, and had agreed to accept the decisions of the Alexandria Conference of October 1944.

Betokening this rapprochement was the official visit paid late in January by King Farouk of Egypt to the Hejaz. Though this visit was officially described as being primarily social and religious in its import, it was inevitable that the two sovereigns should talk a great deal of politics during the week they spent together hunting and attending ceremonies at the Holy Places.

A month later Ibn Saud visited Mr. Roosevelt aboard an American cruiser in the Great Bitter Lake of the Suez Canal, during the President's brief stopover in Egypt on his way back to the United States from the Yalta Conference. This was the first time Ibn Saud had left his country since he had become King. He traveled up from Jidda in his royal tent pitched on the deck of an American destroyer! The conversations of the two men were officially reported to have been marked with cordiality and understanding, though the communiqué issued after their meeting was not very revelatory.

The real nature of their discussion came to light only on Oct. 18 when Secretary of State Byrnes made public an exchange of letters between the President and the Arab monarch. The latter, in a communication dated Mar. 10, gave a rather remarkable "history" of the Palestine problem going back to 3500 B.C., supposedly proving the Arab case in that endless controversy. He concluded by asserting that "All we ask is that the Allies should fully realize the rights of the Arabs and for the present prevent the Jews going ahead in any new matter which may be considered a threat to the Arabs and to the future of every Arab nation, in order that they, the Arabs, may be assured of justice and equity in their lands." The President's brief reply, dated Apr. 5, stated among other things that "Your Majesty will recall that on previous occasions I communicated to you the attitude of the

American Government toward Palestine and made clear our desire that no decision be taken with respect to the basic situation in that country without full consultation with both Arabs and Jews. Your Majesty will also doubtless recall that during our recent conversation I assured you that I would take no action, in my capacity as Chief of the Executive Branch of this Government, which might prove hostile to the Arab people." The publication of these documents naturally brought a storm of protest from Zionist quarters (see PALESTINE).

On March 1 Saudi Arabia was at war with Germany and Japan, except for the Holy Places, which were technically to continue neutral. Shortly thereafter Saudi Arabia became the 45th of the United Nations.

The refinery of the American-Arabian Oil Co. at Ras Tanurah on the mainland north of Bahrein was reported nearly completed as the year opened. It was to have a capacity of 50,000 barrels a day. In addition the refinery on Bahrein was being enlarged and a pipeline was being laid to it from the mainland. Italian laborers from Eritrea were among those used in these building operations. Early in the year this oil company also completed surveying possible routes for a pipeline from the oil fields along the Persian Gulf to seven points on the Mediterranean: Tripoli, Sidon, Haifa, Gaza, El Arish, Port Said, and Alexandria. None of these routes was less than 1,000 miles in length and each was estimated to cost from \$55,000,000 to \$75,000,000—part or all of which might be covered by a United States Government loan.

By 1945 no less than \$100,000,000 in American capital had already been invested in Arabian oil, and it was confidently predicted that this sum would rise to \$1,000,000,000 within a decade or less. There were around 2,000 American technicians and businessmen in the country, plus 500 more in Bahrein. The American-Arabian Oil Co. also gave employment to over 10,000 Arab workmen. Oil was not the only American interest in Arabia. Among the other enterprises which might be mentioned were banking and shipping concerns, the Saudi Arabian Mining Syndicate working for gold in the northern Hejaz, agricultural missions seeking to improve irrigation systems and a military mission training Saudi Arabian troops. A great airport was also being built at Dhahran, near the oil fields. Though constructed with American money and under American direction, it was eventually to be turned over to the Saudi Arabian Government. All of these rapidly expanding American interests inevitably created diplomatic problems, which were the subject of conversations in Washington on July 31 and August 1 between the Amir Feisal, Minister of Foreign Relations for Saudi Arabia, and the State Department.

At the close of the year King Ibn Saud was preparing to go to Egypt in order to return Farouk's visit of the preceding January.

The Yemen was not drawn so closely into world affairs as Saudi Arabia, though in February it was authoritatively reported that the Imam's government had notified the Egyptian Foreign Ministry of its adherence to the protocol of the Arab League. The Yemen joined the Arab League in March and its representative took part in the periodic meetings of that body.

ROBERT GALE WOOLBERT.

ARCHAEOLOGY. The outlook for archaeological exploration this year has been little better than in the previous years of the war. There have, however, been some systematic digging and some

chance discoveries that should be recorded. At Assuan in Upper Egypt excavations have brought to light a fine Hellenistic temple built, so the inscriptions tell us, by one of the cavalry regiments of Ptolemy III. Nearby was recovered a marble statue of Venus. Some twenty miles south of modern Heliopolis Dr. Etienne Dreeton, director of the Egyptian Service of Antiquities, has discovered evidence in a tomb that ancient Heliopolis was situated at this place instead of at the site of the modern town. Here were found a great number of tombs which showed the place to be the ancient necropolis. Some of the inscriptions carry back to 5000 B.C. (the 1st Dyn.).

At Khirbet-Kerach, ancient Beth Yerach, on the southwest shore of the Sea of Galilee the Jewish Exploration Society has found far below the surface of the ground remains of buildings dating back 2,000–2,500 years. One of the finds was two groups of buildings, located on either side of a road ten meters wide, belonging to a suburb which was begun in the Ptolemaic period. One of the houses showed a paved courtyard, living-rooms, bath, kitchen, and storerooms. On the site was recovered a considerable amount of pottery, including some Rhodian jars the handles of which bore inscriptions which date them 220–180 B.C. Remains of what may have been temporary Roman barracks were also uncovered. The site of the town had been occupied from the fourth millennium to the 24th century B.C. The town had been destroyed and rebuilt several times. The height of its prosperity was reached in the middle of the 3d century before Christ.

At Alaca Hüyük, about thirty-five kilometers north of Bogaz Koy, excavations have been again conducted on this well-known site which have brought to light information which illuminates the culture of Anatolia before the coming of the Hittites (2100–1200 B.C.). In the graves, which lay between the levels V–VII, many vessels of gold were found. Not the least interesting was a silver idol the breasts and shoes of which were of gold. Besides this there came to light gold and silver bracelets and a silver spoon with a golden handle. Iron was apparently a treasured metal. The evidence recovered from this excavation reveals that a high culture existed here in Anatolia between 3000 and 2000 B.C.

Recent excavations at Tell Hassuna in northern Iraq show that settled communities existed here back to the Neolithic Age. Seven levels were uncovered, each of which afforded a village plan with the complete organization of a farming community. The site appears to have been occupied as far back as the fifth millennium B.C. Among the objects recovered were an almost-intact primitive sickle and a hoe of stone still showing traces of the bitumen with which the handle was attached. The earliest painted pottery, which is the oldest discovered in Iraq, is of the rectilinear geometric style.

OLIVER S. TONKS.

ARCHITECTURE. A marked discrepancy appeared in 1945 between the large bulk of work in architects' offices and the small amount of building in the field. From a state of relative inactivity architects' offices sprang into feverish action accelerated by the war's end. Meanwhile actual building declined to so low a point that the construction industry accounted for only 2 percent of the country's economic activity instead of the customary 11 percent. Skyrocketing costs made much of the paper work futile and, as the year ended, architects were

trimming away every possible excess item from their plans to save as many as possible of them for actual building.

In the war theaters the ruin became ever more appalling, with the destruction shifting naturally to Germany and Japan. The incomparable city centers of Nuremberg and Dresden were reduced even more completely than Warsaw had been, and a similar fate overtook innumerable other towns. In the case of Frankfurt, the historical heart of the city was gutted, but the works of I. G. Farbenindustrie were spared and along with them the modern housing. As the year ended scientists were declaring that it would now be possible to destroy every product of human culture in an area equal to the states of Illinois and Indiana combined, with a single atomic bomb.

City Planning. A wave of antagonism against any form of super-imposed control nullified the value of most theoretical planning projects completed in 1944 and widely publicized, such as the plan for Greater Boston. A competition similar to the Boston competition was initiated by the *Herald Examiner* in Chicago for judgment in July, but the announcement of awards was not made until December and there was no publicity.

A "super-colossal" model of Toledo by the industrial designer Norman Bel Geddes was completed at a reported cost of \$250,000 under sponsorship of the *Toledo Blade*. It was confined to transportation only, making grandiose plans for the twenty-four railroads entering Toledo and for the port, which is the third largest on the Great Lakes. Nevertheless, when the time came for action, the New York Central System announced a new station in the old location, to be designed by its own work forces.

Public. A significant project, which included elements not only of town planning but of the newer sort of functional public architecture, was the town of Oak Ridge, Tenn., housing a population of 75,000 workers on the atom bomb. It was erected in great haste and was necessarily chaotic but the town plan as a whole (Skidmore, Owings & Merrill, architects) was finely conceived, and there were some splendid individual passages among the self-contained community provisions that included schools, a shopping center, library, churches, hospital, and recreational center for the self-contained city.

Industrial. Latest dams and structures of the Tennessee Valley Authority (TVA), rushed through for war production, were released for publication during 1945. Designed and constructed by the engineering and architectural staff of the Authority, they displayed the same grand simplicity that had made the earlier TVA structures some of the most satisfying architecture of the modern world. Noteworthy among the new dams was the Cherokee Dam, five miles above Knoxville.

No details could yet be released about the huge atomic bomb plants at Oak Ridge and elsewhere.

Commercial. It was true of commercial buildings as of most others that those which were reported in the architectural press during 1945 had generally been built before war interdictions. This was true of the Sill Building at Bakersfield, California, a quite remarkable integration of architectural forms with pleasant working arrangements. Exterior office walls were entirely glass, well shaded by continuous, wide, cantilevered balconies toward the street, serving also, in the mild climate, as the only corridors. These balconies created powerful horizontal recesses alternating with a warm surface of

Pompeian red brick. Franklin & Kump and Associates were the architects.

There was great activity in store design, continuing trends familiar in recent years. In department stores, in particular, counters were made to follow "flow lines" as free as those of traffic highways, serving also to produce visual "pockets" more easily explored by the eye than the endless perspectives of rectangular rows of counters of previous custom. In many small stores the availability of bent lighting tubes and other new devices tempted the architects into a baroque treatment which effortlessly matched a low public taste.

Increasingly, industrial establishments used plants as showrooms, e.g. Sunrise Dairies, Hillside, New Jersey, Serge P. Petroff & Harvey P. Clarkson Associated Architects, and the very neat visitors' building of the John Morrell & Co. packing plant at Sioux Falls, South Dakota, Harold Spitznagel, Architect.

Social. The war has brought a fresh new genre in the form of grouped community facilities. The community building for the Holley Park Housing Project in Seattle, Jones, Ahlson & Thiry, associated architects, made very pleasant provision for recreation and nursery care in a grouping which was nicely and inconspicuously related. Among schools and hospitals some quite beautiful examples have been added, notably the Carmel High School, Carmel-by-the-Sea, again by Franklin & Kump and Associates. Here all the functional efficiency developed within recent years was incorporated in large, easy, and varied forms, many of them having the basic appeal of a large weathered barn, with rich textures, clean construction, and very sophisticated detailing. Perkins, Wheeler & Will added a wing to their very handsome Rugen School at Glenview, Illinois. A quite inventive and a very pleasant elementary school was the one at Paso Robles, California, by Frank Wynkoop & Associates, Architects and Engineers. Here extraordinarily pleasant interiors were created by the use of clerestory windows set well back over spacious floor areas of square classroom. At Berea, Ohio, J. Byers Hays, Wilbur Watson and Associates, Architects, managed a beautiful plan for a combined community, health and child center, achieving good separation among these facilities and a surprising intimacy of scale in relation with the housing development of which it was a part. Another good school was the Jackson School, Wayne, Michigan, by O'Dell, Hewlett & Luckenbach.

Among hospitals, the Midland Hospital (Michigan) by Alden Dow was a very unusual example, set in a richly wooded area and avoiding the hospital appearance altogether, giving the impression outside of being an unusually pleasant country club or inn. The planning was more centralized than the appearance indicated. At Petoskey, Michigan, Skidmore, Owings & Merrill, adding a new wing to their handsomely symmetrical Little Traverse Hospital, managed to improve the appearance rather than detract from it by an unusual splayed disposition of the new wing to fit falling land contours. A new lightness was introduced by the full-length window rows of the sunny bedrooms and corridors.

The most ambitious hospital project to be begun was the Tripler General Hospital on the Island of Oahu, Hawaii, by the U. S. Army Corps of Engineers and York & Sawyer, Architect-Engineers, with Paul Cret Consulting Architect. Designed to serve as permanent hospital for the Army base, it creates an entire village occupying 360 acres on a sharply rising site.

Among churches, the most remarkable was a tour-de-force by Bruce Goff for the "Seabees" at Camp Park, California. The unpromising material for the nave was a pair of giant-sized, arched, corrugated, metal-covered "Quonset" huts. When combined with wide transversely projecting pylons of salmon red brick, treated inside with insulating material, given dramatic though simply contrived lighting, and embellished with plant material and a pool, these made up into a building of quaint picturesque charm and considerable dignity.

Airports. In no field were the concepts of just yesterday so obsolete as in airports, and there was feverish design activity to correlate the innumerable new requirements set up by the performance of new planes and by new concepts of public convenience (v. *Architectural Record*, April 1945, "Airports, Building Type Study No. 100, in Collaboration with *Aero Digest*.")

Newly finished work was very scarce, however, except for the terminals of the Air Transport Command, set up all around the world under direction of Charles M. Goodman, architect. The most complete was at Washington, D. C. This was very unusually fresh and free in planning, in composition, in planting, and in the very direct use of well-proportioned wood-and-glass units, largely prefabricated.

Recreation. Near Denver, Colorado, under the direction of Burnham Hoyt, Architect, there took shape the Red Rocks Amphitheater which may well take its place among the great architectural concepts of history. As in many of these supreme enterprises, the major part of genius lay in discerning how many things not to do. The original rock formation in the Rocky Mountain foothills was a sloping ledge bounded left and right by huge sandstone monolithic cliffs. With a minimum of excavation the sloping site was leveled for seats and excavated material was used to build a platform and storage house at the bottom. The natural formation itself is said to provide perfect acoustics, a whisper being audible from one end to the other, and the majesty of the setting is that of Nature, the hand of man doing only what was irreducibly essential to complete her work.

Residential. An unmistakable trend was in the direction of public acceptance for contemporary forms in architecture. A sampling of opinion among its readers by *McCall's*, a leading women's periodical, resulted in exactly one-third voting a preference for contemporary examples, despite the fact that financial restrictions have confined the number of contemporary houses actually built so far to a vastly smaller proportion of total operations.

The latest trends were expressed largely through models and competition drawings but some good houses were given publication. Among them was a pleasant H-shaped house, by W. W. Wurster of Wurster & Bernardi, creating a separate living and dormitory zone by means of a glazed gallery; a hillside house in San Francisco by Gardner Dailey, most agreeably linked with the garden by means of a "colossal-scale" two-story conservatory window reaching slightly above the main roofline; a town house in New York by William Lescage, making use of artificial light and ventilation to convert the dead interior of the long slab-shaped plan into useful bathrooms and utility space—the living room being allowed to occupy the entire length of the second floor, as usual in the new town-house type largely developed by this architect. There was the very personal, somewhat stiff but elegant house of the artist Millard Sheets in Claremont, done in association with Benjamin H. Anderson; a

house in northern California by John B. Yeon, in that half-ranch, half-forest lodge manner which makes for local charm in the area. A "solar" house, far more "modern" than any yet prefabricated, was prepared for the mass market by George Fred Keck and Edward W. Green, intended to fall within the \$6,000 to \$7,000 price range rather than the more customary \$2,000 to \$3,000 range. Finally, there were unpretentious houses carrying forward the vernacular building habits of America, one by Walter K. Behrendt for his own use at Norwich, Vermont (John Spaeth, Jr., associated), and the other a very individual little home of fieldstone and salvaged materials at Miami, Florida, by Alfred B. Parker, achieving distinction at a cost of no more than \$200.

New Materials. The war could not fail to leave new building materials and methods behind it. Among lumber products there were many synthetic forms of wood: the "impregs" made by impregnation with synthetic resins, with a controlled range of density and strength; the urea woods, made pliable for working, setting firmly later; hardwood made from soft woods by water-insoluble resins forced into the cells; fireproof wood, plywood tubing, wood bonded to metal or paper finishes. The chief use for much touted plastics turned out to be auxiliary functions such as bonding. For example, a hemp-fiber felt immersed in plastic compound could be molded with great ease to shapes such as furniture, boats, house-trim. Plastics were devised for insulation that would foam to fill hollow areas and set to retain their shape; cellular glass produced by the expansion of gas was becoming another favored insulating material. Plastic insulation replaced precious rubber on electric wiring.

A new hybrid doing the work of masonry was aluminum corrugated sheeting to serve as the outer wall face, with a backing of vermiculite concrete for fireproofing. In masonry, however, the chief progress came through adoption of the 4-inch "modular system" whereby doors, windows and other openings could be made in standard dimensions to fit openings without need for cutting brick or tile. In metals there was anticipated much enlarged use of aluminum, magnesium, stainless steel—but not a revolution. The wonders promised in house equipment, such as airplane heaters, did not materialize, but there was improved use of such new types as radiant heating not only in floors but—by use of copper—in ceilings. The full development of "reverse cycle" heating still seemed dependent on cheap electrical energy. There were new combination kitchen and utility plumbing assemblies on the market by the end of the year, new sealed and thermally insulated double or triple-glass window panes, new fluorescent and "cold cathode" lights, and plenty to go on for a "boom," provided sensible answers could be found to the problems of conversion and the market.

DOUGLAS HASKELL.

ARGENTINA. A republic of South America. Area: 1,079,965 square miles. Population: 13,906,694 (1943). Capital: Buenos Aires.

Argentina is the second largest of the Latin American republics. Two-thirds of its surface consists of plains; the remainder, of the Andean highlands extending north and south along its western frontier. A temperate climate prevails in most of the country, although low-altitude areas of the northwest are sub-tropical and southern Patagonia is cold, with snow falling the year around in Tierra del Fuego.

Government. Under the Constitution of 1853, a federal union of 14 provinces and 9 territories was established. The Constitution provides for a bicameral legislature composed of a Senate of 30 members, elected by provincial legislatures for 9-year terms (one-third to be elected every 3 years), and a Chamber of Deputies of 158 members directly elected for 4-year terms (one-half to be elected every 2 years). The President is chosen by electors for a 6-year term, and cannot immediately succeed himself. He is to be assisted by a Cabinet of 8 members. Provincial governors are elected by local suffrage.

President Ramón S. Castillo was overthrown by a military coup on June 4, 1943. General Pedro P. Ramírez assumed the presidency on June 6, 1943, and he was succeeded by Brig. Gen. Edelmiro J. Farrell on Mar. 10, 1944. The Congress was dissolved shortly after the 1943 revolution, and political parties were abolished.

Events, 1945. As the year opened, the Argentine Foreign Ministry was awaiting the reply to its request that a conference of American foreign ministers be called to consider the position of the Buenos Aires Government in the American family of nations. It came on Jan. 8, when the Governing Board of the Pan American Union voted unanimously, the Argentine delegate abstaining, to defer the request indefinitely. This decision was taken, the Board asserted, "in view of the fact that the American nations cooperating in the war effort have agreed through diplomatic channels to hold a conference in the near future to study war and postwar problems."

Argentina reacted promptly to this rebuff. On Jan. 11 the Foreign Ministry instructed the Argentine representative to the Pan American Union to inform that body that "as long as Argentina's rights are not recognized and the procedures of consultation are altered, as . . . is implied in the resolution taken by the Governing Board . . . the Argentine Government has decided to refrain from participating in the meetings of the Pan American Union."

There were also repercussions in Buenos Aires, where Foreign Minister Orlando Peluffo and two of his principal aides resigned on Jan. 15. Peluffo's statement that he had stepped out, "not for reasons connected with my official functions, but because of my points of view regarding the Government's recent orientation of domestic matters," suggested that other than international factors may have been involved. On Jan. 17 Finance Minister César Ameghino was named Acting Foreign Minister; and Amaro Avalos, a retired lieutenant colonel, was appointed Minister of Agriculture to succeed Gen. Juan D. Pistarini, who had held the post temporarily.

The "orientation" to which Peluffo referred may have been an apparent tendency to court democratic sentiment within Argentina, which accompanied the overtures to the other American republics. The Government announced on Feb. 9 that the country had entered upon a "period of pre-electoral preparation," and on the same day it received a preliminary report of the commission which had been appointed to set up a new political party statute. And on March 10 Vice President Juan D. Perón announced that he would not be the presidential candidate of any political party, as the "military statute forbids me to do so;" but he left himself a loophole by adding that no person, whether soldier or civilian, could be deprived of his constitutional right to occupy the presidency.

These assurances had little effect on opposition

opinion. On Feb. 27 a manifesto appeared, signed by hundreds of citizens in all walks of life and affiliated with various political parties, requesting the restoration of full constitutional freedom. On March 2, 1,500 members of the Unión Cívica Radical, the country's most powerful political party, issued a statement condemning the Farrell-Perón regime as a "political system alien to the national spirit." And on March 19, 400 Socialists in Buenos Aires province made the first open attempt since the June 1943 revolution to unite liberal forces by calling for the creation of a "great national movement" in favor of constitutional government.

To counteract this growth in opposition sentiment the Government now had ready to its hand a decree of Jan. 15, for the "suppression of crimes against the security of the state." Its general effect was to penalize severely every conceivable form of treason, espionage and sabotage, and to strengthen the Government's control over labor and industry. It was regarded as a new weapon for the Government against its internal enemies on both the right and left, and against any hostile foreign influence.

On Feb. 21, 19 American republics convened in Mexico City for an Inter-American Conference on Problems of War and Peace, in accordance with the announcement made by the Pan American Union on Jan. 8. Neither Argentina nor El Salvador was invited, but El Salvador was admitted during the course of the conference.

One of the final acts of the conference before it adjourned on Mar. 8 was to hold out an olive branch to Argentina. Resolution LIX declared "That the unity of the peoples of America is indivisible and that the Argentine Nation is and always has been an integral part of the Union of the American Republics." Argentina was then invited to identify itself with the common policy by signing the Final Act of the Conference. Finally, there was a warning that lip service would not be enough: "The conference hopes that the Argentine Nation will cooperate with the other American Nations."

It had been evident, before the Conference invitation was offered, that Argentina would accept it. On Feb. 17, the Foreign Ministry released a note addressed to the German Foreign Office, energetically protesting against a German "threat" to deny safe conduct to seven Argentine diplomats awaiting exchange in Goteborg, Sweden, and warning that if this attitude were maintained, Argentina would consider it an "act of hostility." This was backed up by a press campaign apparently intended to arouse the reportedly apathetic population in favor of a declaration of war against the Axis. (On February 28 the Berlin radio stated that the Argentine diplomats would be repatriated.) On Feb. 20 the Foreign Office announced that German funds in Argentina would be embargoed to defray the cost of two Argentine ships sunk and one damaged by submarine action, and to cover expenses of internment of the crew of the Admiral Graf Spee. British Foreign Minister Anthony Eden told the House of Commons on March 7 that the Argentine Embassy had assured him that no persons accused of war crimes would be permitted in Argentina, nor could they acquire property or deposit capital there. Argentina resumed its seat in the Pan American Union Governing Board on Mar. 12, when Rodolfo Arias, charge d'affaires in Washington, attended a special meeting in honor of the Acting Foreign Minister of Brazil, Pedro Leão Velloso.

The final indication that the Farrell Government

had decided on its course came on Mar. 23 when the nationalistic Minister of Justice and Public Instruction, Rómulo Etcheverry Boneo, resigned, stating: "In view of the course that it is now desired that our foreign policy should follow in its objectives and procedures, I find it impossible to continue to collaborate with the President." (The Minister of Agriculture, Col. Amaro Avalos, was designated Acting Justice Minister on Mar. 26; he was the seventh man to have held the post within 22 months.)

After a long Cabinet meeting on Mar. 27, the Government issued a communiqué stating that it accepted the invitation of the Mexico Conference and "adheres to the Final Act of the said conference. To the end of identifying the policy of the nation with that of the other American republics . . . there is declared a state of war between . . . Argentina . . . and Japan. There is also declared a state of war between . . . Argentina and Germany, in view of the character of the latter as an ally of Japan." A week later the 20 other American republics recognized the Argentine Government, ending a diplomatic quarantine of more than a year.

Buenos Aires followed up its declaration of war with an anti-Axis campaign that seemed sincere: all resident nationals of Germany and Japan were ordered to register as "aliens under surveillance," and their funds and property were placed under government control; 700 persons were arrested in a large-scale hunt for spies, saboteurs and enemy sympathizers; and confiscation of Axis companies was decreed.

Recognition of the Argentine Government meant the appointment of a new United States Ambassador. The man chosen was hard-hitting businessman-diplomat Spruille Braden. He made it clear, as soon as he reached Buenos Aires, that his Government had not changed its opinion of the Farrell regime in spite of its about-face in foreign policy, and his public utterances reflected a growing belief that the Colonels' regime was not following through on its fulfillment of the Mexico City resolutions. Secretary of State Stettinius backed the Ambassador on May 28 with a blunt statement that the United States was not in sympathy with a good part of Argentine policy.

(On Aug. 25 Braden was appointed Assistant Secretary of State in charge of Latin American Affairs, succeeding Nelson A. Rockefeller.)

Foreign Minister Ameghino replied to the Secretary with new pledges, and some democratic gestures were made. But news which came through and around a tightened Argentine censorship told another story. Wholesale arrests of business leaders, newspapermen and other opponents of the Farrell-Perón regime were reported. People were being seized on street cars when they were overheard criticizing the Government. Arnaldo Cortesi of the New York Times cabled his paper that "things have happened in Buenos Aires recently that exceed anything this correspondent can remember in his 17 years' experience in Fascist Italy."

The United States increased its indirect pressure on Argentina on June 25 when Assistant Secretary of State William L. Clayton reported that four known "spearheads of Axis economic penetration" in Argentina were in "process of elimination," but that 104 others had not been touched.

Meanwhile, formidable new opposition to Perón came into the open at home. The principal Argentine business and industrial organizations, long hostile to the Government, virtually declared war

on it on June 16 with a full-page newspaper advertisement protesting the "dangerous consequences" of the official economic and social policies. Perón deprecated this attack. He was glad to see, he said, that the country's "real industrialists" were not among the signers—an obvious reference to the cattle interests which are the backbone of the Argentine economy. Three days later the "real industrialists," represented by the powerful Argentine Rural Society and the Rosario Rural Society, expressed their "absolute solidarity" with business and industry, and on June 22 the Industrial Union, the only important business group that had not signed the original statement, gave its endorsement. And the Buenos Aires Association of Lawyers condemned the Government's treatment of political prisoners.

On June 28 the universities staged the first successful anti-government protest demonstration. Fifty thousand students, representing every Argentine university and every student organization from left to right, walked out of their classes for one day. Most professors joined the demonstration.

In July the political parties, suppressed since December 1943, entered the attack. More than a thousand Radical leaders used a party banquet as a forum for harsh attacks on the Government and renewed pledges of non-cooperation with it. And the small but influential Socialist Party adopted a resolution that the Government "had failed politically, mentally and morally."

At a military "comradeship dinner" preceding the celebration of Argentine independence day (July 9) President Farrell defied his opponents. Then he executed a tactical withdrawal by announcing that the long-promised elections would be called before the end of the year, that they would be "completely free," and that "we are not manufacturing our own successors"—an apparent reference to Perón's presidential ambitions.

All this time U. S. Ambassador Braden had been carrying on his outspoken campaign against the rulers of Argentina and in support of the country's democratic elements. Late in July he was the victim of a brief but intensive counterattack. Hundreds of anti-Braden posters appeared on the walls of Buenos Aires and Calle Florida was white with leaflets. These depicted the envoy as a tough cowboy who was trying to run Argentina and they tried to connect him with a recent disastrous fire in a Chilean copper mine founded by Braden's father but owned by other interests for many years. The climax of the smear campaign was a mass meeting in the Casino Theater in memory of the miners who died in the Chilean disaster. The Government disavowed the campaign but the police made no effort to interfere with it and it was far too well organized to be the work of individual fanatics. During its later stages Braden was out of the city. When he returned a crowd of 2,500 democrats, including political and economic leaders of the country, gave him a triumphant reception at the railroad station.

Farrell's announcement of forthcoming elections intensified political activity. Undeterred by Farrell's declaration of July 8, Perón was busily seeking political support. The large and somewhat unwieldy Radical Party offered a good hunting ground. Some elements of it seemed receptive but the party organization turned him down sharply and decided to expel any of its leaders who accepted government posts or collaborated with the Government in any way.

On Aug. 1 the Government announced new rules under which political parties would be allowed to

resume activity. Federal electoral courts would be named. Within ten days after they were set up, they would appoint provisional committees of party members to reorganize each of the major parties: National Democrat, Radical and Socialist. The Government added that "there is no reason why the Communist party cannot take part in political activities." In the meantime, parties would be allowed to hold indoor meetings without police permits and lifting of the four-year state of siege was promised "at the opportune moment." (This was done on Aug. 6.) Political leaders were highly critical of the reorganization plan, which they feared would enable Perón to "reorganize" parties for his own ends. Announcement of these changes was one of the last acts of Navy Minister Rear Admiral Teissaire in his second capacity as Acting Minister of the Interior. On Aug. 29, J. Hortensio Quijano, a Radical, was named permanently to the post; he was immediately expelled from the party.

Small-scale street clashes had been no novelty in Buenos Aires during the first part of the year. But the surrender of Japan and the end of World War II brought on the bloodiest riots since the June 1943 revolution. Student victory celebrations turned into anti-government demonstrations, and these resulted in street battles between the students and nationalist groups. The unofficial three-day (August 14-16) toll was four dead, some 200 injured, and considerable property damage.

A minor Cabinet crisis developed on Aug. 22. Finance Minister Ceferino Alonso Irigoyen resigned, charging that the Army had interfered with his efforts to reestablish constitutional normality, and Foreign Minister César Ameghino also gave up his post. Perón took advantage of the opportunity to add two more renegade Radicals to his Cabinet: Armando G. Antille in the Interior Ministry, and Juan Issac Cooke in the Foreign Ministry.

An Argentine White Paper issued on Sept. 11 purported to show how the Farrell Government had fulfilled the pledges embodied in the Final Act of the Mexico City conference. Washington was unimpressed. And on Sept. 19, Argentine democrats held a great March for Freedom and the Constitution which was a complete repudiation of the Government. A crowd conservatively estimated at 250,000 paraded through the streets and plazas, swore solemn allegiance to the constitution and dispersed quietly and in order: "Buenos Aires lived one of its great days yesterday," *La Prensa* said on the following morning.

But the Government struck back hard. The state of siege was reimposed on Sept. 26. Democratic newspapers were raided and there was a wave of wholesale arrests of prominent opposition businessmen, educators, politicians and newspapermen. The roundup ended as suddenly as it had begun and within a few days most of the prominent prisoners had been released. The Government was apparently satisfied with its show of defiance.

Argentine students went into action again on Sept. 28, when a strike was called in all six Argentine universities and students barricaded themselves in university buildings. Police measures against the strikers were ineffective until Oct. 4, when the officers went seriously to work. Several students were badly injured when police took La Plata by assault, and one by one the other universities capitulated or were overrun. There were serious riots at the end of the strike as relatives and aroused citizens protested the rough treatment of the students, many of whom were girls.

Through all this storm of opposition, Perón seemed unmoved: "Everybody is demanding my

head but thus far no one has come to get it," he boasted. Students, businessmen, politicians, workers did not matter as long as the Army stood behind him.

But on the night of Oct. 8 the Army suddenly turned against the Colonel. The younger officers at Campo de Mayo, the great Army base in suburban Buenos Aires, saw the reputation and prestige of the service being damaged by Perón's political activities. They wanted to remove the Army from politics altogether and return the Government to the people. General Eduardo Avalos, commander of Campo de Mayo, was as ardent a nationalist and militarist as Perón, but he was also an opportunist and a personal rival of the Colonel's. He quickly assumed leadership of the young officers' movement. The Government could not stand against the Army, and on Oct. 9 it was announced that Perón had resigned as Vice President, War Minister and Labor Secretary; he was confined on the penal island of Martín García.

The rebellion spread as older officers joined it, and it took a liberal trend. Newspaper suspensions were lifted, political prisoners released, and elections called for April 7, 1946. On Oct. 12, the entire Cabinet resigned with the exception of Avalos, who had been made War Minister, and Rear Admiral Hector Vernengo Lima, newly appointed Navy Minister. The following day Avalos and Vernengo Lima took over all but two Cabinet posts and, with Farrell, formed in effect a ruling triumvirate.

Perón was out but it quickly became apparent that there was no one to take his place. The officers differed as to whether to oust Farrell and hand the Government over to the Supreme Court, or to leave the Government in power until elections could be held; suspicious civilians hesitated to cooperate with the military.

The result was virtual paralysis of government, which lasted for several days and gave Perón his chance to come back. On Oct. 16 he claimed to be ill and had himself transferred from Martín García island to the Central Military Hospital in Buenos Aires. Here he was able to get in touch with the labor elements, comparatively small in number but tough, armed and well-organized, whom he had won over to his side long before.

There were scattered disturbances in the industrial suburbs on that day. They increased in intensity and on the following day spread into Buenos Aires itself, where strikes and organized terrorism shut down all transportation and business. The strong police force, which Perón had built up as a counterweight to the Army, made no attempt to interfere. Finally, Perón left the hospital and 50,000 persons crowded into the Plaza de Mayo as word went out that he would address them.

Shortly before midnight Perón appeared with Farrell. The President embraced him publicly as the crowd roared its approval. The Avalos-Vernengo Lima Cabinet had resigned, he announced; an ardent Perón supporter had been named Labor Secretary, and the Government would not be turned over to the Supreme Court. Perón called on all workers to take part in a 24-hour general strike to celebrate the "day of glory" and for a day his "labor" supporters, described as mostly irresponsible rowdies, ruled Buenos Aires. Observers called the whole performance an example of organized disorder reminiscent of early Nazi tactics. When it was over Perón was in power again, although he took no post in the Government and retired from the Army.

Attention turned then to the forthcoming election, the date of which was advanced from April 7 to Feb. 24. Supporters of Perón (Peronistas) opened headquarters on Nov. 9 and the opposition also went into action. The country's largest party, the Unión Cívica Radical, traditionally avoids coalitions and a stubborn group had been fighting a proposed electoral union of parties opposed to Perón. But on Nov. 14 the Radicals finally agreed to make common cause with the Socialists, Communists and Progressive Democrats, on condition (acceptable to the other parties) that both Presidential and Vice Presidential candidates be Radicals. The new coalition (Democratic Union) included every major party in Argentina with the exception of the conservative National Democrats; but all leading National Democrats had repudiated Perón. The lines were now clearly drawn and the country settled down to a bitter last-ditch struggle. Anti-Semitic outbursts became frequent, the religious issue was dragged in, and street demonstrations by both sides kept Buenos Aires stirred up. Both the Peronistas and the opposition staged large-scale demonstrations late in December.

The Government on Dec. 20 put into effect a decree granting widespread wage increases to practically all Argentine workers. It ordered increases ranging from a minimum of 10 percent to a maximum of 25 percent for those in the lower income groups, and payment of an annual bonus of one month's wages. This was believed to be a substitute for a profit-sharing plan devised by Perón, which the Cabinet had rejected; and Labor Secretary Col. Domingo A. Mercante credited Perón with "labor's new gains." The organized business community declared that it would be "absolutely impossible" to comply with the decree.

The campaign speeded up still more as the year ended. Perón completed an energetic week-long campaign swing through the northern provinces. And on Dec. 31 the Radicals nominated José P. Tamborini, former legislator and Cabinet Minister, for President, and Enrique M. Mosca, one-time Governor of Santa Fé, for Vice President. They would be supported by all the parties of the Democratic Union.

Foreign Relations. Argentine foreign policy during 1945 was concentrated chiefly on its relations with the other American republics as a group (see *Events* above). Its place in the international system was defined at the United Nations Conference on International Organization at San Francisco, when as a result of its declaration of war on the Axis, and over the strenuous objections of the Soviet Union, it was admitted to membership in the United Nations.

Argentine relations with the United Kingdom were much more cordial than with the United States during the year. At the annual Fourth of July luncheon of the United States colony, the British Ambassador, Sir David V. Kelly shared the platform with United States Ambassador Spruille Braden, and seemed to answer reports that Britain and the United States were at odds on Argentine policy by echoing Braden's indirect attacks on the Farrell-Perón regime: "Just by imprisoning a few thousand Gestapo toughs," he said, "you do not kill the ideas which put them in power. Like a hydra with its hundred heads, ideas continually rise again, wherever there is suitable ground for them to grow in and whenever those whom they menace become slack or disunited." But two months later, when Braden had become Assistant Secretary of State in charge of Latin American affairs, and U. S. policy had stiffened, a British

Foreign Office spokesman told the press that Britain and the United States would abandon their co-ordinated foreign policy toward Argentina and would conduct their future relations with that country on an individual basis. Britain had not been advised in advance that the United States was adopting a new policy, the spokesman asserted. There were reports from Ottawa that Canada might follow London's lead.

The Foreign Office admitted that Britain's dependence on Argentine foodstuffs made a "stern" attitude impossible, and British businessmen, supported by their Government, exerted every effort to strengthen trade ties with Argentina. During the spring a group of British businessmen and technicians, whose expenses were paid by the London Government and who were called "Britain's post-war spearhead in South America" by local traders, arrived in Buenos Aires. By the end of the year it was reported that the British were definitely getting off to a big lead in the fight for the huge Argentine market. In December, Leslie Hore Belisha, former British War Minister, toured Latin America on behalf of unidentified but non-governmental British interests. Some commentators remarked, however, that at this time British activity in Argentina consisted more of promise than performance.

It was apparent that Sweden, also, was making a major drive for South American, including Argentine, trade. A mission representing Swedish heavy industry had visited Argentina in 1944, and its accomplishments were reflected in official figures for Swedish-Argentine trade in the first quarter of 1945. Argentine purchases from Sweden amounted to more than \$4,500,000 as against less than \$2,000,000 during the same period of 1944; but Argentine exports to Sweden declined from \$4,853,000 in the first three months of 1944 to \$1,396,000 in 1945.

Early in August Sweden signed an agreement with Argentina providing for exchange of Swedish manufactured goods for Argentine agricultural products, except beef, mutton and certain other meats, "in the largest measure possible," and "for an indefinite time." Among the urgently needed articles which Argentina would receive were steel bars, pipes, ball bearings, surgical instruments, oil-well drilling machinery, electrical equipment, telephones and accessories, machinery, motors and engines, and electric-light bulbs.

A financial agreement signed during the fall by Argentina and France marked the restoration of direct trading between the two countries after the wartime lapse. A feature of the agreement was a credit of 150,000,000 pesos to cover Argentine exports to France. While the products to be traded were not specified, it was understood that France would get mainly wool, grains, meat and quebracho extract while Argentina would receive perfumes, wines, champagnes and essential oils.

While Argentina's relations with her immediate neighbors remained officially correct, they were clouded by reiterated charges that the Buenos Aires Government had imperialistic ambitions. Democratic Argentine exiles in Montevideo declared that such opposition nationalist parties as the outlawed Integralistas in Brazil and the Blanco Nacionalistas in Uruguay were working with Argentine nationalists to rebuild the old Viceroyalty of the River Plate, which had included most of the southern part of the continent. Both Chile and Uruguay showed signs of nervousness. In an interview with the Santiago weekly *Ercilla*, Alfredo Rosende, chairman of the executive committee of the important Chilean Radical party, stated that

the Argentine dictatorship threatened the peace of America and that Chile must face that menace "which one day may force us to change the Christ of the Andes for machine-gun nests and barbed wire entanglements."

Tension between staunchly democratic little Uruguay and its powerful neighbor was increased by the proposal of Uruguayan Foreign Minister Rodríguez Larreta that the American republics agree to joint intervention in any American country which denies democratic rights to its people. *La Época*, Perón's journalistic mouthpiece, bitterly attacked Uruguay and made veiled hints that the Montevideo Government had better watch its step. Argentine hostility was also manifested in such petty ways as by enforcing literally all the wartime restrictions on travel and business between the two countries.

Economic Conditions. Continued Argentine prosperity was viewed as inflationary, and as leaving unsolved such serious economic problems as an acute shortage of fuel, deterioration of the transport system, diminishing supplies of essential raw materials, and the constantly increasing cost of living.

By December the worst part of the fuel crisis seemed to be over. Gasoline rationing was scheduled to end on Jan. 1, 1946, and sufficient reserves of fuel oil were being built up so that it would probably no longer be necessary to burn grain.

The transportation system, however, was badly disabled by lack of railroad equipment, trucks, tires and spare parts. This made it difficult to get agricultural products from the interior of the country to the ports, and cut heavily into shipments to regular customers as well as proposed shipments of Argentine food stuffs to war-devastated Europe.

Food supplies for export were further reduced by a prolonged drought in the principal farming and cattle areas. Corn, wheat and linseed crops were far below normal, and cattle fattening was affected in some places. At the end of the year private grain interests estimated that the wheat crop would be no more than 3,000,000 tons. This is approximately the domestic consumption, which would leave only the previous year's carry-over for export. The same sources estimated that this would not amount to more than 1,000,000 tons, in spite of much larger figures put forward by the Government.

Exports in general fell off during the first half of 1945, reversing the wartime trend.

The third annual report of the State Merchant Marine, issued in December, showed impressive accomplishments. The fleet had been started when the Government seized a number of Italian ships blockaded in Argentine ports. Other ships were bought or leased, and in 1944 the fleet carried 5,435,898 tons of exports and 498,298 tons of imports. It made a net profit of \$7,200,000 which was added to a reserve fund which now amounts to \$16,320,000. The fleet was reported to be in the market for up to 1,000,000 tons of shipping.

Late in December the Argentine Government decreed the creation of a state-controlled air transport fleet to serve both domestic and international routes. Its backbone would be the *Lade* (Líneas Aéreas del Estado), an army-operated state line, which private lines would be asked to join. It was emphasized that there would be no interference with international lines already operating in Argentina, such as Pan American Airways and Pan American-Grace Airways.

The People. Ninety-seven percent of the population is estimated to be of European descent, chiefly

Spanish and Italian; the remainder of Indian and mixed extraction. Argentina's population is predominantly urban with an estimated 75 percent concentrated in towns and cities of over 1,000 inhabitants. Highest regional density of population (in the eastern pampa) is about 26 persons per square mile; densities in all other regions are less than 8 per square mile. The three largest cities are: Buenos Aires, 2,600,000; Rosario, 517,000; and Córdoba, 274,000.

Spanish is the official language. The Roman Catholic Church is supported by the State, but other faiths enjoy complete freedom. In 1943 religious instruction (Roman Catholic) was made compulsory in primary and secondary schools.

Argentina is rapidly developing its educational opportunities and facilities. It is estimated that at least 85 percent of persons over 18 years of age are literate, while recent official figures give 11 percent illiteracy for the country as a whole, with only 2 percent in the Federal Capital. Primary education is now free and obligatory. There are over 14,000 elementary schools with a total of more than 2,000,000 pupils; 250 high schools with a total enrollment of about 125,000; and 6 universities having a total student body of some 39,595. Argentina has more than 100 normal schools and a wide variety of institutions giving specialized instruction in agriculture, art, commerce, industry, etc.

National Economy. Argentina's economy is based on agriculture and cattle raising. Wheat and corn are the most important crops, but linseed, other grains and cereals, sugarcane, cotton, potatoes, and grapes are also significant. Before World War II some 60 percent of the wheat, 80 percent of the corn, and 90 percent of the linseed were exported. Argentina was the world's leading exporter of corn and linseed, and one of the chief exporters of wheat. The war caused a sharp decline in exports of these crops. Production figures for the leading crops in 1943-44 were: 6,800,000 metric tons of wheat; 1,573,000 metric tons of linseed; 8,730,000 tons of corn; 5,512,000 tons of sugarcane; 119,921 metric tons of cotton; 1,404,000 tons of potatoes; and 251,900 metric tons of grapes.

Cattle raising is second in importance in the country's economy. Argentina normally produces three-fourths of the world's exports of chilled beef, and is the second largest exporter of mutton, and third of wool. Frozen and canned meat, hides, casein, and butter constitute the chief products of the livestock industry. Total livestock in the country as of June 30, 1945 included: 34,010,300 cattle; 56,181,800 sheep; 8,009,700 hogs. In 1943, packing and slaughterhouses handled 6,698,000 beef cattle, 11,900,000 sheep, and 3,500,000 hogs. Production of dairy products in 1944 included: 47,332 metric tons of butter and 72,042 metric tons of cheese. In 1943, 28,599 tons of casein were made.

Argentina is the leading manufacturing country of Latin America. The essential elements for extensive development of heavy industry, however, are lacking. Coal and iron deposits are limited and of low quality; waterpower sites are chiefly located in undeveloped areas. Processing of agricultural products is the leading industry, food, beverage, tobacco, and textile industries are important, while leather and chemical manufactures are increasing. Other manufactures include: cement, paper, electrical equipment, tires, glass, pharmaceuticals, and fabricated iron and steel products.

Foreign Trade. The total value of Argentine exports in 1944 was 2,352,881,000 pesos. Of this the United Kingdom received 37 percent; United

REFUGEES

Painting by Cpl. William Teason (Kingman AAF, Arizona), 9th Service Command, and shown in the Army art contests, sponsored by Special Services Division. These produced 215 winning paintings, drawings, sculptures, photographs—exhibited at the National Gallery, Washington during the summer of 1945.

LOW ALTITUDE FORMATION

Painted by Lt. Richard H. Wilt (Green-
ville AAF, S.C.), Fourth Service Command.

TO WHOM IT MAY CONCERN

Painted in tempera by Sgt. Roy Q. Tir-
man. (Ordinance Office, Detroit, Mich.)

THE DUST IS WHIRLING IN THE DUST

Painted in tempera by Pfc. Arthur M. Kraft. (Santa Ana AAB, Calif.)

FOG

From the painting by Jon Corbino, awarded a \$500 prize in the 2nd Annual "Portrait of America" exhibition. (*Pepsi-Cola*)

COCKTAILS

From the painting by Guy Pène Du Bois, awarded the \$1,200 Altman Prize

A FAREWELL TO PISA

From the painting by Edward Laning, awarded the M. V. Kohnstam Prize of \$250 at the 56th annual exhibition of the Art Institute of Chicago. (*Life—Midtown Galleries*)

States 22.2 percent; and Brazil 9.3 percent. Principal exports are agricultural and pastoral products. Wheat, corn and linseed lead the agricultural exports; meat, hides, wool, dairy products, by-products and residues constitute the chief animal products exported. Meat exports accounted for about one-eighth of the total tonnage exported in 1944, and made up one-third of the total value of exports. In that year a total of 786,416 metric tons of meat products were exported of which the bulk went to the United Kingdom. During 1944 Argentina exported 141,861 metric tons of hides and skins. Leading groups of exports in 1944 listed according to value: livestock products, 1,340,164,000 pesos; agricultural products, 596,141,000 pesos; forest products, 39,810,000 pesos; minerals, 26,338,000 pesos.

Argentine imports in 1944 reached a total value of 1,007,154,000 pesos. Brazil supplied 34.2 percent; United States 15.1 percent; United Kingdom 8 percent. Textiles, foodstuffs, paper and wood and their manufactures, and chemical products comprised Argentina's chief imports. In 1944 the three most valuable groups of imports were: textiles, 261,964,000 pesos; wood and manufactures, 128,941,000 pesos; food, 109,755,000 pesos. Other important groups of imports were: paper, cardboard, etc.; chemicals, drugs, oils, paints; fuels and lubricants; iron and manufactures.

HARRY B. MURKLAND.

ART. On the eve of the great war, with American art-students hurrying back as quickly as possible to the safety of the homeland, watchful observers said: "This war is going to be terrible for all the world but at least we shall have one recompense: our artists now will be obliged to go native. This puts a period to the business of imitating European styles in painting. We shall perfect our own."

Much of this, it now appears, was wishful thinking. It is true that many of the younger painters, impressed by the publicity and high prices which were gained by the Iowan, Grant Wood, did hie themselves back to the districts they had come from, and almost over night, or so it seemed, we had an enormous number of proficients plying the local legends everywhere and demanding support from local museums—for another development during the recent years was a vast increase in minor museums. Every small town had one. And shortly, with so many artists being "local," it was discovered that that was not so easy a way to become distinguished as it had been. Even Grant Wood, John Steuart Curry and Thomas H. Benton, who were the first to lead the cohorts into the homespun regions, were no longer so heartily acclaimed as they had been. There was no doubt but that all these men were valiantly forgetting the styles of Europe; but were they developing first rate styles of their own? This was not so sure. Apparently more than patriotism is required for the founding of a style, although patriotism and the other warm emotions are, naturally, a help. Nor is patriotism a complete urge to collecting, since it pushes the collector only just so far. It is an unpleasant implication to saddle upon humanity and yet at this moment it would appear that fashion and finance are the chief factors that have led recent American citizens into picture-buying. Certainly fashion and finance had something to do with a marked change in the public taste made evident during the year. For many reasons 1945 was historic, but in the annals of art, it will be the year in which we "went modern," in which the taste for abstract art grew.

It is too early to analyze all the forces back of this astonishing change, but some of them may be noted. One potent influence was undoubtedly the presence in America of a number of internationally famous modernists. Among these were; Fernand Leger, Andre Masson, Marcel Duchamp (painter of the famous "Nude Descending a Stairway"), Yves Tanguy, Kurt Seligmann, Max Ernst, Jacques Lipshitz, Chagall and of course the indubitable Salvador Dali. All these men have pronounced and unmistakable styles and when they took part in general exhibitions their art was dominant. This was not lost upon our native artists, nor upon the collectors. Another point not lost was the fact that the dealers in modern art were reporting extremely good sales. Still another opinion-making episode was the sale in the spring of the Walter P. Chrysler, Jr. collection of modern art. Mr. Chrysler's collection had grown to unwieldy proportions and he decided to let some of his less important holdings go. Everybody in the art world knew that Mr. Chrysler was weeding his collection out. There was no illusion about that. It was supposed he would have to take a loss in order to better the standard of his collection as a whole. But he did not take a loss. The prices he received for his "discards" were sensationally high and the profits upon the whole transaction were most impressive. For instance, a panel by the late Piet Mondrian consisting of black lines on white with a rectangular patch of plain color in one corner, and which, a few short years ago would not have been considered a work of art at all, fetched \$1,400. The memorial show of Mondrian's work at the Modern Museum had made a profound impression upon the public, and had probably given him an "auction rating." The memorial show of Kandinsky at the Museum of Non-Objective Art had also been very effective.

It was not, however, until the Whitney Museum's annual show of "contemporaneous American art," which occurred in the autumn, that it became apparent how deeply this agitation for modern art had seeped into the native consciousness. All the galleries on the lower floors of the museum—those usually considered the most desirable—were given over to the works of the abstract painters, and the artists dealing with easily legible subject matter were relegated, for the most part, to the upper floors. The effect of this distribution of the pictures cannot have been intended, yet it was inescapable. Those who ardently champion abstract art were jubilant at the emphasis thus given. Those who insist that art must have subject matter clearly expressed were disappointed. In any case the great number of non-representational pictures marked a significant change in the Whitney Museum exhibitions, hitherto so conservative. Whether or not it was good modernism is another matter. The press, characteristically pleased with novelty, was on the whole kind to the show. One of the exceptions was this writer who, in a burst of annoyance at the American artist's willingness to accept a position among the second-rate, labelled the collection dull and insisted that no one among the new abstractionists came within hailing distance of the aforementioned Parisian modernists. It might be added, for the sake of the record, that the American modernists of most promise at the present time are Matta, Morris Graves, Rufino Tamayo and Mark Tobey. All four seem to be travelling upon their own power and have already arrived at considerable distinction. They will be watched hopefully.

At the Metropolitan Museum of Art two out-

standing events occurred, one a great popular success and the other a feast for the experts. The first was the show of Chinese Mandarin robes, the largest and most important ever shown in America, dramatically lighted to show the effects the superb costumes made when worn in temples or at court; and the other was the re-installation of the Museum's own collection of Greek sculpture. The Museum does not possess a Venus de Milo nor a Dying Gladiator but it has an impressive assortment of corroborative smaller pieces that provide experts with sidelights on Greek history and artists with incentives to perfect their own styles. The activities in all the great museums of America were strenuous throughout the year, and many of them gained important masterpieces. The Frick Museum in New York showed for the first time a large bronze bust by Coysevox and important paintings by Chardin, Constable, and Goya. The late Percy S. Strauss's collection of Italian primitives was presented to the new museum at Houston, Texas. Samuel H. Kress made a further gift to the National Gallery at Washington of eighty paintings and twenty-six sculptures. The same institution received from Lessing J. Rosenwald an addition to his former donation of 1,740 prints. Just as the year was closing the National Gallery received a large cargo of great masterpieces of art from the public and private collections of Germany. It was announced at once that this importation was a matter of temporary expediency and that the pictures were eventually to be returned to the galleries to which they belonged. It was not announced that they were to be publicly shown in Washington but the mere presence of these works of art in the National Gallery is looked upon as an indication that such an exhibit may be held. If it does the event may easily be the most interesting of the new year.

HENRY MCBRIDE.

ASIA. Including the Asiatic part of the U.S.S.R., the continent of Asia has an area of about 16,752,600 square miles and a population estimated at 1,200,000,000. See the separate articles on ARABIA, CHINA, INDIA, JAPAN, and the other Asiatic states and territories.

ASSEMBLIES OF GOD, General Council of the. A religious organization incorporated in Arkansas in 1914 by a group of independent pastors interested in a distinctively evangelistic type of mission work. Headquarters, 336 W. Pacific Street, Springfield, Mo. For statistics, see RELIGIOUS ORGANIZATIONS.

ASTRONOMY. With the end of World War II, many astronomers and astrophysicists were released from secret war-related endeavors to resume their pursuit of pure science at observatories and technical laboratories throughout the world. Such significant developments as were announced during the year revealed that the photographic and research programs of many astronomical organizations, although greatly curtailed, were satisfactorily fruitful.

Of special note was the final achievement by scientists employed by the United States government of the release of atomic energy on a large and explosive scale, helping to bring the war to a speedy conclusion. It was recalled that the precise theoretical groundwork for obtaining energy from the interior of the atom was established in the early years of this century by astronomical physicists such as Einstein, Bohr, and Rutherford. The power (except heat) at present obtainable in

large amounts is the result of conversion of but a minute amount of mass into energy, being largely incidental to the atomic fission which divides a uranium or plutonium nucleus into two nearly equal parts. It may therefore be readily appreciated that the present success is just a small step toward obtaining all the energy latent in any total mass annihilation. Einstein has shown that the energy equivalence of mass is given by the simple formula $E = MC^2$, where C represents a velocity of light of about 3×10^{10} cm/sec. In more familiar terms, a mass of one kilogram (2.2 lbs.), if totally converted into usable energy, would equal 25 billion kilowatt-hours or the total electrical power output of the United States for a two months period in the year 1939.

Some years ago the Belgian astronomer Lemaitre suggested that a somewhat similar explosion of one gigantic, all-encompassing, original atom may have produced the elements of our existing physical universe, including the Milky Way and other galaxies, our sun and solar system, and all the interspatial debris of meteors, comets, and star-dust. This theory stated further that the observed red-shift in the spectra of remote galaxies is explainable as the evidence of the continuing expansion of our entire universe, following the original cosmic explosion of several billion years ago.

A new theory of the details of planetary evolution was proposed by C. E. von Weizsäcker, of Germany. It is supposed that a spherical shell of gas, rotating about our primitive sun, gradually took on a disk shape within which sub-vortices accounted for the ultimate formation of the planets. A great advantage of this assumed process is that the light hydrogen and helium components of the rotating gaseous mass, in dissipating themselves from the outer edge of the disk, carried away some of the "troublesome angular momentum that constituted the main obstacle to success of so many theories" of planetary evolution.

Work on the 200" telescope at Mt. Palomar, California, was resumed and is expected to be completed about 1947. Announcement was made of the appointment of Dr. Ira S. Bowen as director of Mt. Wilson Observatory, and the administrative merger of Mt. Wilson and Mt. Palomar as soon as the 200" telescope, the largest in the world, is completed. The research program will be under the joint supervision of the California Institute of Technology and the Carnegie Institution of Washington, D. C. Dr. Bowen is well known for his interpretation of the once mysterious solar element "nebulium" as ordinary oxygen and nitrogen in unusual states of electron activity.

A report in the U.S.S.R. Astronomical Circular, by Dr. I. S. Astapowitch, suggests the possibility that the earth has a tail, somewhat like cometary trains. Study of the sun's counter glow, or gegenschein, in the earth's night sky revealed wave lengths which might be expected from the earth's extremely tenuous atmosphere at distances beyond the moon's orbit. This would make a "tail" about 50 earth-diameters long. It is said to consist of minute particles moving in hyperbolic orbits, convex to the sun because of the pressure from its radiation.

A new lunar map, twenty-five feet in diameter—the largest ever made, has been completed by H. P. Wilkins, prominent English selenographer. Based on telescopic observations and photographs, it is to be reproduced on the more convenient scale of 100" diameter, and will provide an invaluable reference chart for astronomers interested in detecting surface changes on the moon.

A. C. Clarke, in the *Journal of the British Astronomical Association*, reviews the possibility of using radar-tracking equipment in solar system parallax determinations. By timing the reflection of radio pulses sent to distant objects, a mechanism is provided believed capable of easily measuring the distance to the moon or planets. Reports have been received of echo-delays corresponding to distances of 700,000 mi; others up to 68,000,000 miles have yet to be confirmed. Topographical details may also be disclosed by the nature of the reflected pulses, and this technique gives promise of telling much about the surfaces of the planets, especially cloud-covered Venus.

Lowell Observatory astronomer Giclas detected in May the periodic return of two well-known comets, Pons-Winnecke, last seen in 1939, and comet Kopff. In April and June, two new comets were discovered by the Harvard Observatory station at Bloemfontein, South Africa.

The total eclipse of the sun on July 9 was widely observed along a path extending from northwestern United States, across Canada, Greenland, Norway, Sweden, Finland, and European Russia. The Royal Canadian Air Force expedition made a complete aerial record of the spectra of the solar corona and chromosphere throughout totality, for study of polarization effects, also direct camera photographs of the corona and prominences, these being the first such records made at an altitude of 30,000 feet. Extensive programs on timing of contacts, shadow-bands, meteorological data, flash spectra, sky-light intensity, radio interference, and corona measurements were successfully completed in the United States, Sweden, and elsewhere. At Butte, Montana, the New York City Amateur Astronomers Association's expedition obtained what is believed to be the first full-color photograph of the totally eclipsed sun enveloped by the descending shadow-cone of the moon.

On August 28, the Swedish astronomer Dr. Nils Tamm of the Kvistaberg Private Observatory found another nova, or exploding star, in the constellation of Aquila. This was the third nova discovered by Dr. Tamm in the same region of the sky. Its observed magnitude was 7.5, just below naked-eye visibility. Analysis of its spectra shows two surrounding shells of gas expanding at speeds of 2100 and 1300 km/sec. Based on a computed distance of 8000 light-years, the nova's absolute magnitude, or intrinsic luminosity, is -6.8 , or about 40,000 times as bright as our sun would be if placed at a comparable distance.

On December 18-19, a total eclipse of the moon occurred, the last for at least three years, according to computations made thus far by astronomers of the United States Naval Observatory.

GEORGE V. FLACHY.

AUSTRALIA. A self-governing dominion of the British Commonwealth of Nations. Capital, Canberra. Australia proper includes 6 states and two territories, with a total area of 2,974,781 square miles. The Commonwealth of Australia also has political control of Papua, Norfolk Island, the Ashmore and Cartier Islands, the uninhabited Australian Antarctic Territory and Nauru (mandated to the British Empire). The territory of New Guinea, comprising Northeast New Guinea, the Bismarck Archipelago and part of the Solomon Islands, is administered by Australia under a League of Nations mandate.

Government. Executive power is vested in a Governor-General appointed by the Crown and in a ministry responsible to the Federal Parliament.

There is a Senate of 36 members (6 from each state) elected for 6 years and renewed by half every three years, and a House of Representatives of 75 members apportioned among the states on a population basis and elected for three years. Governor General, the Duke of Gloucester (assumed office early in 1945). Prime Minister, Joseph B. Chifley, chosen by the Labor Party to succeed John Curtin, who died on July 5, 1945.

Events, 1945. Australia's transition from war to peace was gradual but decisive. It was announced at the end of August by the leader of the Opposition, Mr. A. W. Fadden, that the Advisory War Council would be dissolved immediately. The Council was constituted in October, 1940, after the Labor Party had refused to join the National Government in Parliament, which the general election had almost evenly divided. All of the original members were present at the final meeting on Aug. 31, except Mr. R. C. Menzies, who withdrew early in 1944, and the late Prime Minister John Curtin.

The cost of the war to Australia, according to figures published in October, was more than £2,000,000,000. Two of every three men between 18 and 40 served at some stage on a full-time basis in the fighting services. Casualties were 95,561, including 29,365 known deaths from all causes and 6,009 men missing. Prisoners unaccounted for at the end of September were approximately 4,000.

Steps were immediately taken by the federal government to relax wartime controls at a pace calculated to avoid mass unemployment and to stimulate the building industry. All powers of direction to jobs by the Government were relinquished, and in selected industries employers were permitted to seek and employ labor without first seeking government permission. Bans on starting new industries without official permission were lifted, and war production and war contracts were tapered off.

Foreign Affairs. After hostilities with Japan ended the Australian Government consistently maintained that it had received insufficient consideration in the negotiations. In a statement issued on Aug. 24, Herbert V. Evatt, Minister of External Affairs, said that the United States Department of State had rejected Australia's claim to have General Sir Thomas Blamey represent it in Japanese peace discussions, that Britain had attempted to relegate the Dominion to a subordinate status, and that the Australian Government had resorted to direct dealings with Gen. Douglas MacArthur and the United States Minister at Canberra to obtain recognition of Gen. Blamey at the surrender ceremonies.

Evatt reached London on Sept. 6, in time for the last of a series of conferences held by British Foreign Secretary Ernest Bevin in preparation for the meeting of the Big Five Foreign Ministers, and presented Australia's case for a more severe attitude towards Japan. Evatt stayed some weeks in Britain, and acted in the place of S. M. Bruce, retiring High Commissioner for Australia, until the arrival of the new resident minister, J. A. Beasley, who was Minister of Defense in the Australian Cabinet. At the meetings of the Far Eastern Advisory Commission in Washington in November, Evatt was named chairman of the policy subcommittee. In an address before the National Press Club in Washington on Nov. 16, the Australian Minister for External Affairs challenged the need for continuing the wartime practice of determining international issues by unanimous agreement of the Big Three and called for more democratic procedure.

Australia's participation in the United Nations Conference for International Organization at San Francisco from April to June was prefaced by an official visit to France by Evatt, High Commissioner S. M. Bruce and Army Minister F. M. Forde. Evatt discussed with French Foreign Minister Bidault the association of France, Britain, United States and Holland in establishing control of the Pacific and the question of trusteeships. The Australian delegation at San Francisco, under the chairmanship of Sir Frederick Eggleston, Minister to the United States, was active throughout the conference in offering amendments for the protection of middle and small powers. Australia was represented at the conference of the International Labor Organization which opened in Paris on Oct. 15.

The termination of lend-lease arrangements by the United States in August was followed immediately by the curtailment of Australian purchases in this country. The Australian Government put a value of \$835,004,000 on supplies, services and facilities provided through June 30, 1945 to all United States forces, as against American lend-lease exports to Australia in the same period amounting to \$1,154,000,000. Millions of dollars' worth of United States Army Air Force communications were transferred to the Royal Australian Air Force after the end of hostilities with Japan.

Official figures released in Canberra on July 22 showed that marriages involving American men and Australian girls reached 5,957 at the end of 1944 but that a large number of such marriages failed. Forty-eight per cent of the Americans married Queenslanders, 21 per cent Victorians and 19 per cent residents of South Wales. On July 20 Prime Minister Chifley introduced in the House of Commons a bill which would enable a girl who married an overseas service man since the beginning of the war to institute divorce proceedings in Australia without the necessity of travelling to the husband's homeland.

Australia's first consulate general in the United States was opened in New York City on Nov. 14 with C. V. Kellway, former deputy director of Australia's war supplies procurement office in North America, as consul general. On Feb. 2 the Australian cabinet appointed Alfred Stirling High Commissioner to Canada. Members of the Australian delegation to the United Nations Conference at San Francisco visited Canada before returning to their homes. The new Soviet Minister to Australia, N. M. Lifanov, presented his credentials to the Australian Prime Minister on July 12.

Political Changes. The Duke of Gloucester, new Governor General of Australia, reached Canberra on Jan. 29 to assume his post, to which he was appointed in November, 1943, and was sworn in the following day. On April 18 the Duke and Duchess arrived at Hobart for a five-day visit to Tasmania.

Labor Prime Minister John Curtin, who took office two months after Pearl Harbor, died in Canberra on July 5. He was buried near Perth, in Western Australia. Because of a protracted illness he had been absent from the San Francisco Conference. The death of the Prime Minister while holding office brought into direct operation the constitutional royal prerogative. The Governor General of Australia, the Duke of Gloucester, who was in the Solomon Islands visiting Australian troops, flew at once to Canberra to perform his vice-regal function in appointing a new first minister to the Crown. The Duke chose Army Minister Francis M. Forde, who had been acting prime

minister during Curtin's illness, except at the time of Forde's absence at San Francisco, when Commonwealth Treasurer Joseph Chifley took his place.

Chifley was elected Prime Minister on the first ballot of the Parliamentary Labor Party on July 12 and thus became the 16th prime minister of Australia. The party decided not to exercise its option to elect the entire list of ministers afresh, but filled the one vacancy with Herbert V. Johnson, general president of the Australian Workers' Union, thus preserving Western Australia's representation in the Cabinet. Chifley, a native of Bathurst, New South Wales, and the son of a blacksmith, entered politics from the ranks of the Railway Locomotives Engine Drivers' Union. He first entered Parliament as a labor member in 1928, and in 1935 he was a member of the Royal Commission on Monetary and Banking Systems, a position which furnished background for his work as Commonwealth Treasurer and his activities in preparing the banking legislation passed in Australia in 1945.

The new Prime Minister and his ministry were sworn in by the Governor General on July 13, after the resignation of F. M. Forde, whose seven-day term as prime minister was the shortest in Australia's history. There were few Cabinet changes. The Prime Minister retained his post as Commonwealth Treasurer and assigned Herbert Johnson, the new member, the portfolio for the Interior. The creation of two new offices, that of Minister of Housing, added to the duties of Hubert Lazzarini, Minister for Home Security and Works, and that of Immigration, placed with Information under Arthur A. Calwell, indicated the new Prime Minister's interest in the further development of the social services. There had been no important cabinet changes since Feb. 1, when the late Prime Minister had reassigned portfolios.

Premier of Western Australia Willcox was succeeded on July 31 by F. J. S. Wise, former Minister of Lands and Agriculture in successive Western Australia governments, who became at the same time leader of the State Parliamentary Labor Party. A new Labor Cabinet was set up in Victoria on Nov. 21, with John Cain, Labor Party leader, as Premier and Treasurer.

Banking Control. The Government's bill providing for the extension of federal control of Australian banks was introduced in the House of Representatives on March 8 by Commonwealth Treasurer Joseph Chifley. In a pre-session meeting on Feb. 20 the Parliamentary Labor Party decisively rejected a proposal by extremists in the party for the nationalization of the trading banks. The Government's program as presented to the House took the form of two bills. The first gave permanence to the wartime controls of trading banks which were voluntarily accepted from the short-lived Fadden Government of September, 1941, and which were made legal by the national security regulations promulgated by the present government soon after it took office in October of that year. The second extended the functions of the Commonwealth Bank and abolished the Commonwealth Bank Board.

The bills reflected the Labor Party's long-cherished conviction that in the depression years of 1929-33 the Commonwealth Bank Board and the trading banks pursued an unnecessarily harsh deflation policy and thus caused wide-spread suffering. In the 1945 bills the Commonwealth Bank was empowered to direct the loans and investment policies of the trading banks, control interest rates,

and take over control of foreign exchange. The Commonwealth Bank was empowered to set up a separate division to carry on a general banking business like that of the trading banks.

The banking bills aroused strong favorable and opposing sentiments in Australia as they passed through the several stages in both houses. This was heightened when Treasurer Chifley refused to accept any vital amendments to the bills. The House concluded its approval of the bill on June 29 and the Senate on July 26. By Aug. 2, when both houses recessed until Aug. 29, the trading division of the Commonwealth had opened new branches in accordance with the policy prescribed in the new banking legislation that the Commonwealth Bank should actively compete with private banks.

Australia's financial position at home and abroad was not adversely affected by the introduction and passage of the banking legislation. Australia's largest war-time conversion operation, that of £60,000,000 war loan from a five per cent to a 3½ per cent basis, announced in March, was successfully completed at the end of May. Since Australia had in the past paid up to 6 per cent for sterling loans, the result showed general confidence in the Australian financial situation.

Nationalization of Air Lines. The Government's intention of taking over all interstate civil airlines operations in Australia, announced in November 1944, was expressed in the Nationalization of Air Lines Bill which passed through all of its stages unamended in the House of Representatives on July 31. The nationalization proposal produced active opposition at all stages. It was repeatedly charged by the opposition that the step was a violation of Curtin's pledge in the 1943 election that no industry would be socialized in war time, and that the Government was illegally assuming power over air transport which was refused in the 1944 constitutional referendum. (See YEAR BOOK for 1944, p. 55) In September the Australian National Airways Proprietary Ltd., owners of most of the Australian airlines, took steps to test the validity of the legislation by applying to the High Court for an injunction restraining the Government from interfering in any way with the company's operation of its airline services.

The England-Australia air route was reopened on Feb. 1, after more than four years of difficulty and improvisation. The first direct flight from Sydney to London brought a copy of the *Sydney Morning Herald* for June 2 to the office of the *London Times* on the evening of June 5. On Nov. 2, the R.A.A.F. transport command's 7,000-mile regular four-day service to Tokyo was begun.

Industry and Employment. A White Paper tabled in the House of Representatives on May 30 by Minister for Postwar Reconstruction Dedman assured the country's servicemen, servicewomen, and war workers of peacetime employment. The document, entitled "Full Employment in Australia," described a works program covering housing, harbors, airports, power projects, irrigation and other construction. It expressed the Government's intention of keeping the total expenditure at a level sufficient to employ all resources, with the aid of the new banking system's powers of regulating the flow of credit to ensure stability in capital spending. A section of the press reacted unfavorably to the proposals, arguing that they would require further controls to an intolerable point.

Throughout the year, but at an accelerated speed after the fall of Japan, Australian industry made plans for peace-time expansion. In April it

was announced that General Motors-Holdens Ltd. had reached an agreement with the Australian Government under which it would manufacture cars in Australia with the use of local raw materials and facilities wherever possible. The Government reserved the right to assist other private concerns to enter the field. The large Broken Hill Proprietary Company, Ltd. and associated companies announced in October their plans for spending over £A.7,000,000 on works to increase steel supplies. In November Prime Minister Chifley approved the building of two oil refineries, one in New South Wales and the other in Victoria, by a joint Australian-American Company. Approval was granted on condition that 60 per cent of the shares should be Australian-held and that the company should import its own raw materials on a sterling basis. At about the same time Courtaulds' plans for establishing a rayon plant in New South Wales was announced from Sydney. The staff of 4,000 at the new factory was to be Australian, except for experts from Britain. Commonwealth plans included the standardization of railway gages wherever practicable and the development of Northern Territory.

Industrial disputes in coal, iron, steel, and shipping industries in the final months of the year were allowed to proceed without decisive action by the Government, although Prime Minister Chifley repeatedly gave warning of their disastrous effects upon the Australian economy. Speaking in Melbourne on Nov. 26, Chifley told the coal miners that he would not tolerate dictation from miners or any other union and that he supported the New South Wales Trades and Labor Council's advice that the coal strike be settled by arbitration. Two days earlier Chifley had described the trade union movement in New South Wales as chaotic, with the rank and file of some unions refusing to acknowledge their elected leaders. He said that it was a comic opera situation when he was obliged to resort to the dollar pool to buy steel to keep at work in South Australia people who were financially supporting the New South Wales strikers. The steel strike in New South Wales, which originated in a dispute at the Broken Hill Proprietary over an employee's change of job, was at this time in the hands of the New South Wales Industrial Commission.

A scheduled labor-management conference was postponed on Dec. 2 until better conditions should prevail. Seamen on all coal ships out of New South Wales stopped work on midnight of Dec. 1. Coal mines throughout the state were shut down and a general strike in other areas was threatened. By Dec. 10 Sydney was blacked out because of cuts in gas and electricity supplies. Shipments for Tasmania were affected and commerce with New Zealand was threatened. Up to this time the Commonwealth Government maintained a hands-off attitude, possibly because of the importance in the dispute of the struggle between left-wing and right-wing labor factions.

Immigration Policy. The problem of increasing the population of Australia through immigration was under consideration throughout the year. Army Minister Forde, writing in *The Times* (London) on Jan. 26, emphasized the urgency of a larger population as a means of defense, in view of the fact that an island continent of three million square miles must now be held by a total population of only 7,300,000. He said that Australia should aim at a target of 20,000,000 by the end of the present century, with the migrants coming largely from Britain. Speaking on the same sub-

ject in Canberra on Feb. 12, Forde said that in addition to the hoped-for steady flow of British migrants, Australia would welcome Continental Europeans. The Commonwealth, he continued, had already decided to bring to Australia within three years 51,000 orphan children from Greece, Yugoslavia, Poland, Norway, the Netherlands and other areas. It was announced from the capital in April that these children, who will be wards of the state, will have their primary education in large towns, their secondary in country centers. The experience of caring for British evacuees will be utilized in developing the scheme.

Arthur Calwell, newly appointed Minister for Immigration, told the House of Representatives at Canberra on Aug. 2 that Australia and Great Britain had agreed in principle to free passages for British demobilized service men and women, and their dependents, who wished to emigrate to Australia, as well as to assisted passages for civilians. No large-scale emigration was to be undertaken, however, until Australia had successfully demobilized and re-employed the members of her own fighting forces and until the housing and slipping situation had improved. By the end of the year the Government was prepared to admit 70,000 immigrants annually and, in view of the shortage of migrants of British stock, to admit other nationalities.

Food Production. The drought which was increasing in severity at the end of 1944 was finally broken by rains in June, 1945, but not until it had caused damage which was to be felt for a long time. In grazing areas the feed could not be restored immediately and the problem of maintaining stock remained acute. While the drought lasted sheep were kept alive in some instances by hand-feeding. Supplies of grain for pigs, poultry, and dairy cattle were imported from the United States. In all, three-fourths of the Australian sheep country was drought-stricken and large areas in New South Wales, Victoria and South Australia were virtually denuded of stock. Cattle losses were less severe, because of the greater mobility of cattle and because the cattle areas were less seriously affected. Many had to be killed, however, with the result that meat exports to the United Kingdom suffered less than was expected. Dairy products seriously declined and there was a disastrous mortality among farm horses. By October the outlook was better. Generous rainfall further improved the crop situation. At the end of October the Australian wheat crop was estimated at 135,000,000 bushels, only 3,000,000 bushels below the average.

In the last three months of the year a movement to send gifts of food to Britain, to fill a part of the gap caused by the stoppage of Lend-Lease, gathered momentum. Warships returning to Britain undertook to carry the foodstuffs, and on Nov. 9 the battleship King George V took the first 100 tons of the Victorian Government's gift shipments. Food from Sydney was consigned to a second warship. The South Australian Government pledged £A.10,000 and appealed for large private donations, with the assurance that all gifts would be carried free on the state railways. After a week's visit to Tasmania the Duke of York left with 1,133 cases of food for transshipment to the United Kingdom. The shipments from Australia included jellies and jams, and a variety of canned goods.

Tax Reduction. In the budget introduced in the House of Representatives on Sept. 7, 1945, the Australian Prime Minister and Treasurer, J. B. Chifley, announced a reduction of 12.5 per cent

in the income tax. "Although there appears to be no case for an immediate reduction in taxation at the present time," Chifley said, "it is felt that if no relief were granted now, national production might suffer because of the harmful effects on incentive." The reduction, effective immediately, represented 6.25 per cent for the last half of the current year. Corporate taxation was not altered but stockholders benefited from the reduced individual rates. In order to meet the cost of the social services a social service contribution, entirely separate from the ordinary income tax, was introduced at the rate of 7.5 per cent on present taxable incomes. The combined income tax and social service contribution was not to exceed 87.5 per cent of the existing income tax.

A luke-warm reception was given to the announcement of the tax reduction, chiefly on the ground that it was not sufficiently generous. After the change the Government would still be collecting about twice as much as in its first year of office, during the costliest phase of the war. The financial situation in Australia at the end of the year was far from easy. The cost of the social services was growing and many new enterprises, including the pressing needs of employment, housing and land development, had scarcely begun to make their requirements felt.

Population. More than one-half of the 7,300,000 people in the country live in large coastal towns and cities, the largest of which are Sydney, Melbourne, Adelaide and Brisbane. Vital statistics of Australia show an increasing birth rate (17.9 per thousand in 1940 to 19.1 in 1944) and a decreasing death rate. Civilian deaths fell from 74,486 in 1943 to 69,596 in 1944.

Education and Religion. Elementary education in Australia is free and compulsory, with less than four per cent illiteracy among the adult population. Chief religious affiliations, in the order of their numerical strength, include the Church of England, Roman Catholics, Presbyterians, Methodists and Baptists.

Production. Sheep raising in Australia (125,000,000 head) yields one-fourth of the world's wool supply. The value of wool exports in 1939-1940 amounted to \$185,000,000, a figure which dropped when exports in bales decreased from 3,063,000 in 1938-1939 to 1,959,000 in 1942-1943 because of increased local demands. Approximately 1,205,120,000 pounds of beef, another important primary product of Australia, are produced per year. Primary production in toto (including mutton, lamb, pork, butter, cheese, wheat) was valued at \$604,000,000 in the last normal year, 1939. In contrast to that figure, manufacturing industries in the country produced goods amounting to \$215,190,170.

Foreign Trade. Imports during the year 1942-1943 were valued at £ (stg) 212,106,701, and exports amounted to £ (Australian) 123,052,435.

ALZADA COMSTOCK.

AUSTRIA. A state of central Europe (see EVENTS below). Area: 32,432 square miles. Population (1939): 6,650,000. Vienna, the capital, had 1,918,462 inhabitants; Graz, 210,175; Linz, 131,423. See YEAR BOOKS for 1938 and 1939 for prewar statistics.

Events, 1945. The fall of the Third Reich saw the first victim of Hitler's aggressions emancipated from Nazi rule after seven years of subjugation. Liberation was followed by Allied control rather than by the full independence envisaged at the Moscow Conference of 1943. It was likewise

followed by currency inflation and acute economic distress. Important steps were nevertheless taken toward a new Austrian democracy which would ultimately assume responsibility for its own internal affairs.

Exit Hitler: Re-enter Renner. Allied plans for sharing military control of Austria were prepared, though not publicized, at Yalta while Marshal Fedor I. Tolbukhin's 3rd Ukrainian Army fought its way across Hungary toward Vienna. Soviet broadcasts appealed anew for an uprising against the enemy and pledged respect for Austria's integrity and social system. Red units swept into the capital early in April, aided by anti-Nazi partisans. The final street battles were less destructive than those in Budapest. On April 12-13 all of Vienna fell to Soviet forces, which took 130,000 prisoners. On April 28 units of Lt. Gen. Alexander M. Patch's U.S. 7th Army in Bavaria crossed the Austrian border near Berchtesgaden and soon took Braunau (Hitler's birthplace), Salzburg and Linz, and joined Soviet detachments in clearing the provinces of the remnants of the beaten Wehrmacht.

Along with Léon Blum, Nicholas von Kallay, Nicholas Horthy, Jr., Hjalmar Schacht, Richard Schmitz (former Mayor of Vienna) and other notables, Kurt Schuschnigg, last pre-Nazi Chancellor, was liberated in northern Italy early in May after seven years of relatively mild confinement in various Nazi camps. He disclaimed all future political ambitions, although year-end rumors spoke of his possible appointment as envoy to the Vatican. At the same time Arthur Seyss-Inquart, Austrian "Trojan horse" of 1938, was seized in northwestern Germany by Canadian forces. In its first list of over 300 Nazis to be put on trial as war criminals (issued December 3), the new Austrian regime included Seyss-Inquart, Ernest Kaltenbrunner and Baldur von Schirach, all on trial in Nürnberg, as well as Anton Rintelin, Wilhelm Glaise-Horstenaus, Theodor Habicht and Alfred Frauenfeld.

With Soviet approval, an Austrian Provisional Government was announced in Vienna on April 28 under the 74 year-old Social Democrat, Dr. Karl Renner, first Chancellor of the Republic of 1918 and signatory of the Treaty of St. Germain. Renner now assumed the Chancellorship and the Ministry of Foreign Affairs, which he had held in 1920. His Cabinet included 3 Social Democrats, 4 Christian Socialists ("People's Party"), 3 Communists and 3 non-party men. Owing to the absence of prior consultation, due apparently to various misunderstandings rather than to any deliberate Soviet policy, Washington and London withheld recognition of the Renner regime. Austrian "independence" was nevertheless proclaimed by the new authorities, who rescinded Nazi statutes, restored Republican legislation, outlawed the NSDAP (National Socialist Party) and made provision for punishment of its members. Throughout the year, however, Austria remained occupied territory rather than an autonomous community.

Allied Occupation. Sundry controversies delayed the implementation of joint military control. On May 24, Field Marshal Sir Harold Alexander proclaimed the establishment of an Anglo-American Military Government for the Austrian areas to be assigned to the forces under his command. A month later General Mark Clark was appointed commander of American forces in Austria in anticipation of the creation of 4 occupation zones, with Vienna, like Berlin, to be divided into 4 districts. This arrangement was gradually brought into being in the provinces, but with no common

policy accepted by the occupying authorities. Americans were alleged to be tolerating the retention of Nazis in many posts, while Russians, in addition to living off the country (like the French in the Tyrol), were said to be indulging in numerous depredations and abuses.

Not until early August did Anglo-American forces enter Vienna, whose people were facing currency chaos and famine. The illness of Marshal Ivan S. Konev, coupled with divergent views regarding the food problem, produced further delays, as did the hesitant policy of Washington and London toward the Renner Government. On August 8, a joint Kommandatura was set up in the *Innere Stadt* of the capital. But the Allied Control Council for Austria did not begin to function until mid-September, with Marshal Konev and Lt. Gens. Clark, Emile-Marie Bethouart and Sir Richard McCreery representing the Big Four.

Recognition. In deference to British desires, Chancellor Renner moved in September to broaden his regime. On September 26 a Provincial Conference of representatives from 9 provinces upheld the Renner Cabinet and endorsed its pleas for the abolition of the demarcation lines between the zones, the reduction of the occupying forces and the early restoration of Austrian sovereignty. It further recommended a general election and strengthened the influence of the conservative-clerical People's Party at the expense of the Communists by increasing its representation in the Government and taking control of police and elections out of the hands of the Communist Minister of the Interior, Franz Kohnner.

Harmony between the U.S.S.R. and the Western Powers was not promoted by the London Conference of Foreign Ministers nor by Soviet seizure of the Zistersdorf oil fields early in October, following the rejection by the Cabinet, on Anglo-American advice, of Soviet proposals that half the shares in a projected Austro-Russian oil company be granted to the Soviet Union. These and other properties were regarded by Moscow as part of the "German assets" assigned to the U.S.S.R. by the Potsdam accords of August. On October 7, however, London and Washington indicated that recognition would be granted to the Renner Government. On the 20th the Allied Control Council announced: "The authority of the Provisional Austrian Government, broadened as a result of the Provincial Conference, shall extend under the guidance and control of the Allied Council to the whole of Austria. One of its main duties will be to hold free elections as early as possible and not later than December 31, 1945."

New frictions followed with the revelation, on October 21, that Moscow had offered to exchange diplomatic representatives with Vienna, while Washington and London contemplated only *de facto* recognition, with foreign affairs among the areas of administration reserved to the Allied Council. This issue was resolved in November by the elevation of the political advisers of the members of the Council to the rank of "Political Representatives to the Austrian Government." By the end of the month Allied controls were functioning more smoothly, thanks to the amicable relations which had developed between Clark and Konev. On January 7, 1946, Washington, London, Paris and Moscow announced formal recognition of the Austrian Government.

Elections. In preparation for a popular poll, the Renner Cabinet ordered a re-examination of voting lists to insure the exclusion of all Nazis from the franchise. Both Social Democrats and

Communists accused the People's Party of seeking to enlist Nazi support and appealing to the clerical-fascist elements formerly represented in the *Heimwehr* and the Christian Social Party of Dollfuss and Schuschnigg. Leopold Figl, elevated to leadership of the Party early in September, was above such reproaches, but some of his associates were not. On November 11 the Party's Vice President, Baron Raoul Bumballa, resigned in protest at clerical influences and at the anti-Semitic speeches of the Honorary President, Leopold Kunschak.

On November 25 some 3,500,000 Austrians (62 per cent of them women) cast their ballots for members of a National Assembly and Provincial Diets in the first free election in 15 years. The electorate was smaller by 700,000 than it had been in 1930, most of the absentees being war prisoners or disfranchised Nazis. The People's Party, despite (or because of) its fascist taint, won 85 seats in the Assembly, the Social Democrats 76 and the Communists, always weak in Austria and now discredited by the Soviet occupation, only 4. On November 28 Renner submitted his resignation to the Political Council (a committee of party leaders) but was asked to carry on until a new Cabinet could be formed. On the following day the Constitution of 1920, suspended by the Dollfuss dictatorship in March 1933, was restored to force, pending possible proposals for change by the new parliament.

The Figl Government. On December 4 the Political Council named Figl as Chancellor-designate, with all parties agreeing to continue the coalition. Figl appointed Kunschak as President of the National Assembly and prepared a list of Ministers for approval by the Allied Council. Konev vetoed Social Democrat Andreas Korp for having held office under the Nazis and Julius Raab and Vincent Schumy of the People's Party as clerical-fascists. The new Cabinet as finally approved by the Council on December 18 was as follows:

Chancellor and Foreign Minister—Leopold Figl, People's Party.
 Vice Chancellor—Adolf Schaerf, Socialist.
 Minister without Portfolio to act in foreign affairs—Karl Gruber, People's Party.
 Minister without Portfolio—Alois Weinberger, People's Party.
 Minister of the Interior—Oskar Helmer, Socialist.
 Under-Secretary for the Interior—Ferdinand Graf.
 Education and Culture—Felix Hurdes, People's Party.
 Justice—Joseph Gero, Nonpartisan.
 Finance—George Zimmerman, Nonpartisan.
 Agriculture—Joseph Kraus, People's Party.
 Trade and Construction—Eugene Fleischhaeckel, People's Party.
 Transport—Vincent Vebles, Socialist.
 Power Economy and Electrification—Karl Altmann, Communist.
 Food—Hans Frenzy, Socialist.
 Social Welfare—Karl Maisel, Socialist.
 Minister of State Property and Planning—Peter Kraulain, People's Party.
 Under-Secretary for State Property and Planning—Karl Waldbrunner, Socialist.

On December 20 the two chambers of parliament, meeting jointly, unanimously elected Renner President of the Republic for a 6-year term. He at once swore into office the members of the new Cabinet who assumed responsibility to the National Assembly or lower house.

Unfinished Business. At the beginning of 1946 numerous problems confronting the new Government remained unsettled. Whether a new Constitution for the Second Republic was to be prepared was still undecided. A complex scheme of currency revaluation had been inaugurated in December but was by no means completed. The "German assets" subject to removal by the U.S.S.R.

were also not defined as yet to the satisfaction of all concerned. Famine was averted by UNRRA, but no solid basis of independent national sustenance was yet in sight. On British initiative, negotiations were opened in December for a substantial reduction of the 100,000 Allied troops in Austria (comparable, said Figl, to "four elephants in a row boat"), but no accord had been announced by January. Neither were any steps taken toward the withdrawal of the Allied Council or the conclusion of a peace treaty. Such advances depended in part upon the adjustment of various frontier disputes, e.g. Yugoslav claims to southern Carinthia and Styria, temporarily occupied by Tito's Partisans in May, and Austrian hopes (formally expressed to the Allied Council in mid-November) of recovering from Italy the South Tyrol.

Austria's domestic political prospects depended upon the duration of the coalition and an avoidance of a repetition of the tragic cleavage of the early 1930's between Social Democratic workers and clerical-conservative peasants and property owners. Austria's economic future depended upon trade relations with her neighbors and upon the progress of reconstruction throughout Danubia and Balkania. The crucial decisions shaping the Austrian future remained to be made not in Vienna but in Washington, London, and Moscow.

FREDERICK L. SCHUMAN.

AUTOMOTIVE SAFETY FOUNDATION. A philanthropic organization supported by annual contributions from more than 200 companies in the motor vehicle, parts and accessory manufacturing, rubber, petroleum, financing, and cement industries. Organized in 1937 and expanded in 1942, the Foundation makes grants of funds and staff services to a wide range of national organizations active in the program for safer and more efficient highway transportation. Chairman: Paul G. Hoffman. President: Pyke Johnson. Vice-Presidents: Norman Damon and G. Donald Kennedy. Headquarters: Tower Building, Washington 5, D. C.

BADMINTON. The badminton bird that fell an early captive to wartime restrictions did not obtain its freedom early enough last year to permit major competition and this sport was confined largely to backyard and clubhouse play. The only event of notice held was the Eastern doubles championship in New York, where Frank Williamson and Frank Janensky of New Rochelle won the men's title. Miss Helen Gibson of Westport, Conn., and Miss Mary Schlemm of Boston annexed the women's final and Miss Gibson and Lee Gustavson combined for the mixed doubles crown.

THOMAS V. HANEY.

BAKER ISLAND. An island in the Pacific (just north of the equator; 176°31'W.) which was discovered by Michael Baker, of New Bedford, Mass., in 1832. It has been formally considered an American possession since 1935 when colonized by students of a Hawaiian boys' school. The island is less than a mile in diameter. By an Executive Order issued May 13, 1936, the island was placed under the jurisdiction of the U.S. Dept. of the Interior. Its strategic importance lies in its position between Hawaii and Pago Pago, American Samoa, and in its use as a refueling station on the route between Hawaii and New Zealand. Early in 1942 U.S.

armed forces were withdrawn but in the fall of 1943 they reoccupied the island without opposition and built a radio and aerological station.

CHARLES F. REID.

BALTIC STATES. The three states, Estonia, Latvia, and Lithuania, which separately proclaimed independence from Russia in 1918, were reannexed by the Soviet Union in 1940 in the guise of constituent republics. Occupied by German forces in 1941, they were ruled by Reich Commissioners until their liberation in the fall of 1944. For the governmental setup in each country prior to 1944, see *YEAR BOOK* for 1943, pp. 189, 322, and 341. The latest reliable statistics are given in the article on each country in the *YEAR BOOK* for 1941. For the reintegration of the three states into the framework of the Soviet Union, and extension of their state rights, see the *YEAR BOOK* for 1944, pp. 58-59.

Events, 1945. Developments in the Baltic States, in 1945, remained for the most part shrouded behind an impenetrable veil of censorship imposed by the Soviet authorities. No foreign correspondents were admitted to those parts, and the scant information available from Soviet sources does not add up to a comprehensive picture of life in the reconstituted Baltic Soviet republics. As a result, most of the news concerning the Baltic countries in the past year dealt with their international status rather than with internal events, and referred to them as a group rather than as individual states.

Recognition Still Withheld. The salient fact of an otherwise highly confused situation was that both the United States and Great Britain continued to withhold formal recognition of the Baltic countries' incorporation into the Soviet Union, and that Washington at least continued to maintain diplomatic relations with legations whose governments long ago had ceased to exist for all practical purposes. In August it was reported that the State Department for the time being had shelved all further consideration of what to do with this embarrassing problem, leaving it to be solved by the Council of Foreign Ministers at the eventual peace conference.

The Soviet Government, while it did not press the issue in the diplomatic field, made several indirect bids for at least *de facto* recognition of its claim to represent the Baltic nations as component parts of the U.S.S.R.

The first such bid was made prior to the San Francisco Conference of April, 1945. In the organizational discussions, Russia endeavored to have the three Baltic republics, as well as the Ukraine and White Russia, seated at the conference, but was finally dissuaded on the plea that to raise the Baltic question at that time would cause embarrassment to everyone.

Next, at the International Conference of Cooperatives in London, on Sept. 12, J. L. Rone, Latvian member of the nine-man delegation sent by the Soviet Union, introduced a motion that Latvia, Estonia, and Lithuania should be recognized by the Conference as "independent national republics and therefore eligible to full membership in the International Cooperative Alliance." Mr. Rone declared, in support of his motion, that under the Soviet Constitution the three Baltic States were independent republics having the right to establish diplomatic relations with foreign powers and to be independent members in international organizations. In spite of considerable opposition, the resolution presented by Mr. Rone eventually was passed by the Conference, thus giving the Soviet

Union the first international recognition in this delicate question.

The issue again was brought up in the course of the inter-Allied conferences at which the indictment against the principal Nazi war criminals was drawn up (cf. *GERMANY*). In the text of the indictment finally agreed upon, the Baltic countries were referred to as "Soviet Socialist Republics." This designation caused inquiries as to whether the American and British signatures on the document constituted an indirect recognition of the Soviet claim by the governments of the United States and Great Britain.

Thereupon Supreme Court Justice Robert H. Jackson, the chief American prosecutor, in a letter to his British, Russian, and French colleagues wrote on Oct. 6: "In the indictment of German war criminals signed today, reference is made to Estonia, Latvia, Lithuania and certain other territories as being within the area of the U.S.S.R. This language is proposed by Russia and is accepted to avoid delay which would have been occasioned by the insistence on an alteration in the text. The indictment is signed subject to this reservation and understanding: I have no authority either to admit or to challenge, on behalf of the United States, the Soviet claims to sovereignty over such territories. Nothing, therefore, in this indictment is to be construed as a recognition by the United States of such sovereignty or as indicating any attitude, either on the part of the United States or on the part of the undersigned, toward any claim to redistribution of such sovereignty." Less explicitly, but no less clearly, a British Foreign Office spokesman indicated on Oct. 19 that the attitude of his government in the matter was the same as that set forth by Justice Jackson.

The Refugee Problem. One of the most puzzling problems resulting from the unsettled international status of the Baltic countries was still unsolved by the end of the year: no one apparently knew what to do with the more than 200,000 refugees or "displaced persons," whom the Russian and German armies had driven from their homesteads in Estonia, Latvia and Lithuania.

In mid-October—that is, at a time when some 80 percent of all displaced persons in the American, British, and French zones of occupation in Germany had been sent on their way home—it was officially estimated that the Allies still had on their hands some 21,000 Estonians, 47,000 Lithuanians, and 61,000 Latvians. In addition, Sweden listed 30,000 Baltic refugees, and there were many more thousands scattered throughout the rest of Europe.

Virtually all the 129,000 Balts in the Western Allies' zones of occupation were classed as "probably not repatriable," because of their anti-Soviet tendencies, and some 20,000 of them were described as "violently anti-Russian and pro-Nazi." This state of affairs caused grave concern at General Dwight D. Eisenhower's headquarters, and one officer with wide experience in the handling of displaced persons told a New York Times correspondent on Oct. 14: "In their camps they have organized a secret police run on Gestapo lines, and they are discouraging those Balts who really wish to return home." However, because of the United States' policy of non-recognition, American officials were reluctant to compel any Baltic citizen to return home. Sweden offered in June to repatriate free of charge all those Balts in the country who were prepared to go back.

Economic Reconstruction. By Soviet account, the economic rehabilitation of the sadly devastated

Baltic countries made great progress in 1945. In particular, the Soviet press devoted a great deal of attention to the development of the Estonian shale industry, whose output not only provides liquid fuel for the factories, power stations, and homes of Estonia but is also used for the production of gas for the great industrial city of Leningrad. According to an article in the Moscow *Pravda* of July 21, by the Premier of Soviet Estonia, Arnold Veimer, the country's shale mines are expected to better the 1941 production by the end of 1945. New shafts, providing work for 40,000 miners, are to be sunk in the next three years.

In all three countries, the redistribution of land, which had been initiated immediately after the entry of the Red Army, was brought to a conclusion. Large estates, especially those belonging to the "Baltic barons," were divided up among poor or landless farmers. There were some indications that this land reform was not proceeding smoothly everywhere, for on March 15, *Pravda* called for a "decisive attack on Kulak elements" in the Latvian S.S.R. The paper also complained that the returning Communist Party organizations were not doing enough to offset the "German Fascist usurpers and their helpers, the Latvian German Nationalists," who had "poisoned the consciousness of the workers of Latvia with false propaganda."

Decorations. In September it was announced in Moscow that 350 men and women guerrillas of the Lithuanian Soviet Republic had received decorations for gallantry and valor in battles against the German invaders. The title of "Hero of the Soviet Union," one of the top awards in the U.S.S.R., was conferred on two Lithuanian citizens.

JOACHIM JOESTEN.

BANKS AND BANKING. The chief role of the banking system in the national economy during 1945 was to absorb additional huge amounts of Government securities, thereby assuring the success of new Treasury financing. As in the previous war years, the increase in Government security holdings of the banks expanded deposits correspondingly, and inflated the nation's money supply to new peak totals.

The increase in commercial bank deposits lifted member bank reserve requirements. Expansion of currency circulation made inroads into bank reserves at the same time. The Federal Reserve banks provided additional reserves by expanding their portfolios of Government securities. In this way, a basis was provided for the further expansion of the nation's credit structure. The persistent increase in purchasing power increased the danger of a runaway price rise, since supplies of consumer goods remained quite limited, so that

price ceilings were kept largely intact despite the end of the war.

A keen demand for Government securities by the banking system produced a strong market for Treasury obligations, despite heavy new financing by the Government during the year. The Treasury contributed to the strength of the government bond market by issuing short-term obligations freely. Banks seeking to obtain higher rates of return had to bid in the open market for the relatively limited amounts of longer-term issues available, thereby raising their quotations.

Commercial Banking. Commercial banks expanded their holdings of Government securities by about \$10,000,000,000 during 1945, which compared with net purchases of \$17,716,000,000 during the preceding year. The increase in commercial bank holdings of Government securities was equivalent to about 20 percent of the growth in the interest-bearing national debt of the United States for the year. If increases in Government security holdings by the Federal Reserve banks, mutual savings banks, and the Postal Savings System are taken into account, the banking system as a whole is found to have played even a more important role in Government financing. Between Dec. 31, 1941, and Sept. 30, 1945, approximately the period of United States participation in World War II, the banking system absorbed 46 percent of the increase in the direct and guaranteed debt of the Federal Government, as can be seen from the following recapitulation:

OWNERSHIP OF UNITED STATES GOVERNMENT DEBT

[Estimates, in billions of dollars]

	Outstanding		
	Sept. 30, 1945	Dec. 31, 1941	Increase
Federal Reserve Banks	23.3	2.3	21.0
Commercial banks	83.5	21.8	61.7
Mutual savings banks	10.0	3.7	6.3
Postal Savings System	2.8	1.3	1.5
Total banking system	119.6	29.0	90.6
Individuals	58.5	13.5	45.0
Corporations and associations excluding banks and insurance companies	30.0	4.3	25.7
Insurance companies	23.2	8.2	15.0
State and local governments	5.0	0.5	4.5
U. S. Government agencies and trust funds	23.8	8.2	15.6
Total nonbank investors	140.5	34.7	105.8
Total interest-bearing direct and guaranteed debt	200.2	63.8	136.4

Bank loans and investments other than in Government securities showed only minor changes during the year. With the end of the war, loans for war

TABLE 1—INVESTMENTS, LOANS, AND DEPOSITS OF REPORTING MEMBER BANKS IN 101 LEADING CITIES
(Monthly data are averages of weekly figures. In millions of dollars)

Months of 1946	U.S. Government Obligations	Other Securities	Commercial, Industrial and Agricultural Loans	Loans to Brokers and Dealers in Securities	Other Loans for Purchase or Carrying of Securities	All Other Loans	Demand Deposits Adjusted	Time Deposits
January	44,345	2,889	6,405	1,958	1,593	2,436	35,506	7,802
February	44,074	2,954	6,320	1,754	1,283	2,411	36,493	7,980

September	45,555	3,349	6,096	2,346	1,788	2,631	38,748	9,122
October	45,264	3,286	6,267	2,121	1,406	2,644	39,331	9,238
November	45,373	3,239	6,669	2,225	1,445	2,705	39,751	9,335
December	48,710	3,296	7,148	2,785	2,994	2,899	37,591	9,343

purposes declined, while some increase was reported in loans and applications for loans for ordinary commercial and consumption purposes. Owing to the very strong cash position of business, however, demands for commercial credit were necessarily limited. Bank loans for war purposes, which reached a peak of \$3,500,000,000 at the end of 1943, declined moderately during 1944 and rapidly in the latter part of 1945. This was true particularly of Regulation V loans guaranteed by

compared with \$355,000,000 in the same period of 1944. Prevailing business prosperity and higher security prices increased realized profits on investments and recoveries, while losses and charge-offs were reduced. Though income taxes were higher, the net profits of member banks were \$391,000,000 for the first six months of 1945, as compared with \$314,000,000 for the same period of 1944.

The higher level of bank earnings received some attention from regulatory authorities and in Congress. It was asked whether such earnings were becoming excessive in view of the fact that the chief function of the commercial banking system had become the monetization of a large part of the national debt, rather than making loans to industry, commerce, and agriculture with a considerable degree of risk. Bankers pointed out that they hope eventually to make loans and corporate investments in large volume again, and that such commitments would again cause losses and charge-offs, as in the past, while security profits and recoveries would taper off. They also stressed the point that cash dividends declared by member banks had risen but slightly, amounting to \$116,000,000 in the first half of 1945, compared with \$108,000,000 in the same period of 1944. Larger earnings are thus being used to build up the capi-

the Government. A considerable part of the loans granted by banks during 1945 consisted of term loans to larger enterprises, many of them to refund outstanding bond issues.

Changes in bank investments, loans and deposits from month to month during 1945 are shown in Table 1.

Acquisition of additional Government securities by the banks, many of intermediate term, tended to increase bank earnings. During the first six months of 1945, gross earnings of member banks of the Federal Reserve System reached \$1,016,000,000, as compared with \$901,000,000 in the corresponding period of 1944. Virtually all of this increase consisted of interest received on Government obligations. Expenses rose, chiefly because of higher wages and salaries, but net current earnings for the first half of 1945 were \$415,000,000, as

tal resources of the banks, which is regarded as highly desirable in view of the enormous increase in their deposits and the likelihood that more business loans involving risk will be made in the future. Critics of the high level of bank earnings suggested the sale to the banks of special issues of Government securities with a lower coupon rate or higher taxation of bank earnings as a solution.

Banks increased their capital during 1945 not only through the reinvestment of earnings, but also, in many instances, by the sale of new shares. A number of banks distributed stock dividends, by means of which part of the surplus account was capitalized and distributed to stockholders either in the form of new shares or through an increase in the par value of outstanding shares. However, the expansion of deposits generally outdistanced the increase in capital, so that the ratio of capital

funds to deposits declined further to a new low record.

Bank Legislation. Congress passed a series of amendments to the Federal Reserve Act to head off the possibility that the ratio of gold certificate holdings to deposit and note liabilities of the twelve Federal Reserve banks would decline below the ratios originally inserted in the law. At the same time, other changes were made in monetary legislation to win support for the bill from more conservative elements in Congress. The amendments, approved June 12, 1945, reduced the reserve requirements of Federal Reserve banks against their note and deposit liabilities to 25 percent, and only gold certificates could be counted as reserves by these institutions. The authority previously given temporarily to the Federal Reserve banks to pledge as collateral for Federal Reserve notes outstanding direct obligations of the United States Government was extended indefinitely. The Thomas amendment of May 12, 1933 was amended to terminate authorization for the issuance of \$3,000,000,000 of greenbacks, a power that had never been used. The authority granted the Federal Reserve banks to issue Federal Reserve bank notes, which have no gold certificate cover, as distinct from Federal Reserve notes, was also terminated. The issue of Federal Reserve bank notes had been authorized by Congress during the banking crisis of March, 1933.

Other important banking legislation enacted during 1945 related to international finance. The President signed on July 31, 1945 the Export-Import Bank Act of 1945, expanding the lending authority of that institution. This law increased the capital of the Export-Import Bank to \$1,000,000,000, and the institution was authorized to make loans and incur guarantees in an aggregate amount of \$3,500,000,000, or three and one-half times its authorized capital. A number of credits for foreign governments were arranged following the passage of this law. The bank obtains funds over and above its capital through the sale of notes to the Treasury.

The United States led the way in ratifying the Bretton Woods Agreements when the President signed, on July 31, the Bretton Woods Agreements Act, which accepted membership for the United States in the International Monetary Fund and the International Bank for Reconstruction and Development. It was provided in the law that the Governor of the International Monetary Fund appointed by the President would also serve as Governor of the International Bank, a step that was expected to assure that nations needing longer-term credits would be directed to the Bank, so that they would not freeze the resources of the International Monetary Fund. With this same end in view, the act set up a National Advisory Council on international monetary and financial problems, which was to consist of the Secretary of the Treasury as Chairman, the Secretary of State, the Secretary of Commerce, the Chairman of the Board of Governors of the Federal Reserve System and the Chairman of the Board of Trustees of the Export-Import Bank. This Council is required to recommend general policy directives for the guidance of the representatives of the United States on the Fund and the Bank, and to advise on major problems arising in the administration of these institutions. This legislation drastically amended the Johnson Act of 1934, which prohibited loans to foreign governments in default on obligations due the United States Government, by exempting foreign governments which hold membership in the Fund and the Bank.

The Green Act authorizing sales of Treasury silver to industry was allowed to lapse at the end of 1945, despite urgent demand for this metal because of inability to effect purchases abroad for domestic industrial requirements. The silver bloc in Congress sought an amendment to bar sales below a price of \$1.29 per ounce, which compared with 71.11 cents per fine ounce at which silver was sold by the Treasury until Dec. 31, 1945.

The Money Supply. Although the war came to an end war, the nation's money supply increased almost as much in 1945 as in the preceding years. Currency in circulation increased \$3,208,000,000 during the year, compared with \$4,858,000,000 in 1944. Demand deposits in banks rose by \$8,970,000,000 compared with \$6,127,000,000 for the year before. The annual rate of turnover of demand deposits of banks in 100 leading cities outside of New York declined from 17.3 in 1944 to 16.1 in 1945. The annual velocity of demand deposits of New York City banks increased from 22.4 in 1944 to 24.2 in 1945.

Changes in ownership of bank demand deposits between July 31, 1944 and July 31, 1945 were as follows:

CHANGES IN OWNERSHIP OF DEMAND DEPOSITS
(In billions of dollars)

	July 1944	July 1945	Increase Dollar Amount	Per- centage
Domestic business	37.6	42.4	4.8	13
Personal	18.4	23.0	4.6	25
All others.....	3.6	4.2	.6	17
	59.6	69.6	10.0	17

The end of the war did not bring about an immediate halt in the expansion of currency in circulation. The desire to keep more cash on hand during the period of transition, uncertainties, higher tax payments, inability to obtain many consumer goods, and population shifts incident to the end of the war tended to increase the volume of currency in circulation. The expansion of currency from month to month during 1945 is shown in Table 2.

Federal Reserve Policy. Federal Reserve banks bought more than \$5,000,000,000 of United States Government securities in 1945, to offset the further expansion of currency in circulation and to provide member banks with additional reserves, to enable them to absorb additional Treasury obligations. Excess reserves of member banks of the Federal Reserve System were thus kept above the \$1,000,000,000 level, in accordance with the policy pursued during the war period. The bulk of the Government securities acquired by the Reserve institutions consisted of certificates of indebtedness. On Jan. 2, 1946, reflecting huge open market purchases during the war, the twelve Federal Reserve banks held \$24,091,000,000 of U.S. Government securities, of which \$21,601,000,000 consisted of Treasury bills and certificates.

The chief offset to Government security purchases by the Federal Reserve banks during 1945 was an increase of \$2,892,000,000 in Federal Reserve notes outstanding. A second offset was an increase of \$1,849,000,000 in deposits of the Federal Reserve banks. Gold certificate holdings of the twelve Federal Reserve banks declined by \$582,000,000 during the year, reflecting moderate losses of gold to Latin American and European neutral nations during the last phase of the war era.

With the end of the war, the task of the Federal Reserve System changes in character. Any

decline in currency circulation or inflow of gold would lift excess reserves, thus permitting a reversal of open market policy and a contraction in the Government security portfolio of the Reserve banks.

The Federal Reserve System intensified its efforts to bring additional commercial banks into the par clearance system. Under this system, Federal Reserve banks collect out-of-town checks without charge for banks which do not deduct exchange charges on checks drawn upon them. The Board of Governors of the Federal Reserve System issued a memorandum to member banks stating that, after Aug. 1, 1945, member banks could not absorb for their customers exchange charges deducted from checks drawn on non-par clearing banks deposited by these customers in their bank accounts,

complicated it. On Feb. 5, margin requirements for extensions of credit on listed securities by brokers, dealers, and banks were raised from 40 to 50 percent. On July 5, margin requirements were raised further from 50 to 75 percent, the highest level ever reached. It was recognized, however, that the expansion of the money supply made this action of limited effectiveness, for numerous speculators and investors were able to pay cash for the securities they wanted to purchase.

JULES I. BOGEN.

BAPTISTS. A religious group, probably evolved from the Anabaptist movement of the 16th century, which adopted the principle that immersion is essential to valid baptism. The first Baptist churches were established in Amsterdam in 1608, in London in 1611, and in America, probably at Providence, R.I., in 1639. There are a score or more denominations in the United States which use the name *Baptist*, the largest of which are treated below.

Northern Baptist Convention. This body of the Baptist denomination was composed in 1945 of 36 conventions in 33 States, the District of Columbia, and Puerto Rico. The annual meeting for 1944 was held in Atlantic City, N. J. The 1945 annual meeting was omitted, owing to the war emergency. The next annual meeting will be held in Grand Rapids, Mich., May 21-26, 1946.

The leading denominational papers are: *Baptist Observer* (Indianapolis); *Baptist Record* (Pella, Ia.); *Missions* (New York); and *Watchman-Examiner* (New York).

The foreign mission field includes Assam, Burma, South India, Bengal-Orissa, South China, East China, West China, Japan, Belgian Congo, and the Philippine Islands. The work of the Convention covers domestic, city, and foreign missions; higher education, social service, Sunday schools, and pensions for clergy.

The total membership of the Northern Baptist Convention for 1944-1945 was 1,570,446, distributed among 7,314 churches, mostly above the Mason and Dixon Line. The total amount of funds received and expended by the churches and their agencies, as of Apr. 30, 1945, was \$20,470,926 for church operating expenses and \$6,313,350 for missions, education, and philanthropy.

The officers for 1945 were: Mrs. Leslie E. Swain, President; Rev. J. B. Smith, and C. J. Howell, Vice Presidents; Rev. J. C. Hazen, Corresponding Secretary; Rev. C. M. Gallup, Recording Secretary, and H. J. Manson, Treasurer.

Headquarters of the General Council, the executive body to which is entrusted the work of the Convention between annual meetings, are at 152 Madison Avenue, New York N. Y.

Southern Baptist Convention. This body of the Baptist denomination was formed in 1845, when Southern Baptists withdrew from the national

TREASURY WAR FINANCING

WHERE THE WAR MONEY CAME FROM

except where such charges do not exceed \$2 for any one depositor in a month. Absorption of exchange charges by banks for their customers was held to violate the Federal Reserve Act's prohibition of interest payments by member banks on demand deposits. By the end of the year, only about 2,000 commercial banks, chiefly of small size, remained outside the par clearance system. Every commercial bank in 24 States, and the District of Columbia, had joined the par clearance plan.

The Board of Governors of the Federal Reserve System took cognizance on two occasions during the year of the persistent rise in stock prices, and the growing security market speculation that ac-

organization on account of the slavery issue and also for the better administration of the work of the Convention. It comprises 20 State conventions functioning in the Southern and Southwestern States and extending through New Mexico, Arizona, and California.

The Centennial celebration of the organization was held in 1945 but plans for a centennial convention were cancelled because of the war. Features of the Centennial Crusade were evangelism, enlistment, education, rehabilitation, stewardship, and benevolence.

Officers for 1945 were: The Honorable Pat M. Neff, Waco, Texas, President; Rev. Louie D. Newton, and Rev. Wm. H. Williams, Vice Presidents, the Rev. Hight C. Moore and Mr. J. Henry Burnett, Recording Secretaries; the Rev. Austin Crouch, Executive Secretary (retired during 1945), and the Rev. J. E. Dillard, Secretary of Promotion. Executive Committee offices are at 127 Ninth Avenue, North, Nashville 3, Tenn.

The statistics for 1944 were as follows:

Churches (congregations)	25,965
Ordained ministers	24,011
Church members	5,667,926
Sunday Schools	24,626
Enrolled in Sunday Schools	3,380,630
Enrolled in Baptist Training Unions	759,885
Enrolled in Missionary Unions	719,186
Value of church property	\$259,740,715
Gifts to local work of churches	\$ 59,295,901
Gifts to missions and benevolences	\$ 17,303,519
Total contributions	\$ 76,599,420
Schools and colleges fostered	65
Students enrolled—regular session	28,707
School property	\$ 47,379,498
Endowment funds	\$ 30,230,845
Property of 18 Children's Homes	\$ 7,946,953
Property of 21 hospitals	\$ 19,364,058

National Baptist Convention of America. The 65th annual session was held in St. Stephen's Baptist Church, Kansas City, Mo., Sept. 5-9, 1945. Meeting jointly with the parent body were the Woman's Auxiliary Convention, the Baptist Brotherhood Union and the Junior Women.

The Convention authorized the secretary of its Foreign Mission Board and the president of the Woman's Auxiliary Convention to visit the foreign fields, including Cuba, Puerto Rico, Liberia and West Coast Africa.

The Convention went on record as favoring a permanent FEPC, the repeal of the Poll Tax, passage of an Anti-Lynch Bill, Full Employment Legislation, and a vigorous postwar rehabilitation program.

The statistician's report showed that there were 48 state conventions, 700 district and county associations represented in this body, by messenger and by enrollment, and that the numerical strength of the present convention was 2,365,821. Cash totaling \$46,000 was reported from the Kansas City session. \$10,000 was appropriated to foreign missions, \$4,000 to home missions, \$6,000 to education, \$1,000 to benevolence work, and \$800 to the editorial work of the *Union-Review*.

The following major officers were elected: Rev. G. L. Prince, President; Rev. G. C. Daniels, Secretary; Rev. A. A. Lucas, Treasurer; Rev. A. L. Roach, Field Secretary; Rev. Wm. Grimbale, Corresponding Secretary; Rev. L. B. Tolson, Statistician; Rev. M. C. Allen, Auditor.

The 1946 session of the Convention will be held with the Mt. Zion Baptist Church, Columbia, S. C., in September, 1946. The National Baptist Publishing Board, Henry A. Boyd, Secretary, 523 2nd Ave. North, Nashville, Tenn., is the acceptable headquarters.

BASEBALL. Followers of baseball who had watched our national pastime stagger through three War years viewed the season of 1945 with a feeling of apprehension for even the most optimistic leaders feared that it couldn't be done again in the face of increased travel restrictions and the continued departure of the big-name players for the services.

Yet when the curtain fell on the last game in October many of the fans were left limp in the wake of two torrid pennant races that drew a record total of more than 11,000,000 admissions, and a seven-game world series that surpassed all previous figures with \$1,592,454 in receipts.

Following the collapse of Germany in May, the game got an amber light and when Japan capitulated in August all sports received the green signal. For the most part, the quality of baseball was far below par, but fans obtained some measure of reward when the big stars of other years, such as Bob Feller and Hank Greenberg, began to come back from the wars.

The game provided news all the year round. The first big story broke as early as Jan. 26, when Col. Larry MacPhail, who had retired as head of the Dodgers in 1942 to accept an Army commission, grabbed the headlines with an announcement that he was heading a three-man syndicate that had just purchased the rich New York Yankee baseball empire. MacPhail, Dan Topping and Del Webb bought the Bronx Bombers and all their farm holdings from the estate of the late Col. Jacob Ruppert for \$2,800,000.

On April 24, the sixteen major league club owners came up with another surprise package in the announcement that they had chosen Albert B. (Happy) Chandler, then United States Senator from Kentucky, as commissioner to succeed Kenesaw Mountain Landis, who until his death late in 1944, had ruled baseball with an iron hand ever since 1921.

Meanwhile pennant races that were to reach fever pitch before October had started after the major leaguers had spent their third year of enforced spring training in northern camps. A number of veterans and untried new players were enlisted to relieve the manpower situation and the quality of play was indeed poor. However, the fans came out in force. At the close of the regular campaign, the Dodgers, Giants and Cubs in the National League and the Yankees and Tigers in the American showed attendance figures that soared over the million mark. The Tigers led with 1,280,321, while the two circuits, attracting 11,375,185, set an all-time high, topping their 1944 total by 2,400,000.

The St. Louis Cardinals were picked to repeat in the National League, but the Redbirds, finally war-riddled and brought down to the level of their opponents, had their three-year reign ended when Charley Grimm's Chicago Cubs came crashing through. It was another surprising MacPhail maneuver that helped the men of Grimm, for the new Yank owner, having obtained American League waivers on Hank Borowy, sold the New York pitching ace to the Cubs for \$100,000. This astounding move provided just the lift Chicago needed, for Hank went out to win eleven games, against two defeats, and on the next to the last day of the regular campaign the Cubs clinched the pennant.

An unusually hot race marked the American League play and at times six clubs, including the feared Yanks, were in the thick of the fight. But on the last day, Steve O'Neill's Detroit Tigers, who had lost out in their final game of 1944, turned

back the Browns and finished a mere half game in front of the Washington Senators.

The return of Greenberg served to stimulate the Tigers and Big Hank brought the pennant to Detroit with a mighty home run on the last day of the regular season. Hank's power hitting and the pitching of Hal Newhouser, a 25-game winner, just about did the trick and they did it again in the world series.

The October classic presented a weird assortment of baseball and, although there were a few innings of brilliant feats, the boys for the most time appeared to be engaged in a comedy of errors. Numerous records for misplays were set, but the series did unfold the best-pitched contest in series history when Claude Passeau of the Cubs hurled a one-hitter. Only two Tigers reached first, one on a single, the other on a pass and neither advanced to second.

The scramble continued until the deciding seventh game, when Newhouser, making his third appearance in the series, triumphed over the Cubs by 9 to 3, to give the world championship to Detroit.

Additional surprises came in the wake of the big October show when it was announced that Billy Southworth, successful manager of the Cardinals, had been released to become manager of the Braves, and when the Dodgers signed Jackie Robinson of the Kansas City Monarchs for their Montreal farm, the first time a major league club ever had signed a Negro player. Indications were that other Negroes would follow the brilliant young shortstop into the big time.

Newhouser, one of the greatest hurlers of modern baseball, was chosen as the American League's most valuable player for the second straight season, while Phil Cavarretta of the Cubs won similar honors in the National circuit. Cavarretta captured his league's batting crown with an average of .355 while George Stimweiss, fleet-footed Yankee, paced the American with .309.

Louisville defeated the Newark Bears, 4 games to 2, in the little world series. Newark won the International League's Governors Cup play after finishing behind champion Montreal in the regular season. Milwaukee captured the American Association pennant, Atlanta was victor in the Southern Association, and Portland finished on top in the Pacific Coast League.

New York University carried off Metropolitan Conference laurels, Princeton paced the Eastern Intercollegiate League, and Michigan retained its championship of the Western Conference.

THOMAS V. HANEY.

BASKETBALL. The biggest sports scandal since baseball's "Black Sox" episode of 1919 rocked the game of basketball in January of last year when New York detectives, making an investigation of clothing thefts, unexpectedly uncovered the fact that Brooklyn College players had accepted \$1,000 in bribes to "throw" a contest with Akron University and had tentative plans to do likewise when they met St. Francis, their traditional borough rival.

When a suspect in the thefts, hoping to establish his innocence, blurted to police that he had done nothing more than accept a basketball bribe, he started a real uproar in collegiate circles. Brooklyn immediately expelled the offending players, New York made certain their collaborators were punished and cries for closer supervision of the college court game were heard all over the nation. Officials of most arenas where the big attractions are staged drove off known gamblers and made

sincere efforts to enforce that much neglected rule of "no betting allowed."

Despite the scandal, this country's leading winter sport, which survived many storms during the period of wartime travel restrictions and player shortages, continued its upward swing in popularity. New York's Madison Square Garden, under the guidance of the genial Ned Irish, again stole the spotlight with its colorful program of double-headers.

A rangy band of Oklahoma Aggies, led by the seven-foot Bob Kurland, earned the right to be called national collegiate kings by defeating DePaul University, 52-44, in a Red Cross benefit game that brought together the winner of the Garden invitation tourney and the National Collegiate Athletic Association champions.

The Aggies began their march to the throne when they subdued Arkansas, 68-41, while New York University was downing Ohio State, 70-65, in the N.C.A.A. semifinals. Then, with Kurland scoring 22 points, the Westerners turned back N.Y.U., 49-45, in the last round.

DePaul, paced by All-American George Mikan, won the invitation tourney by routing Bowling Green, 71-54, in the final round after crushing Rhode Island State, 97-53. The year's biggest Garden court crowd, 18,253 persons, saw the great Mikan tally 53 points to equal Rhode Island's total and set a new Garden record. Mikan then registered 34 markers in the deciding game with Bowling Green.

Paired against the Oklahoma Aggies in the benefit game that netted more than \$50,000 for the Red Cross, DePaul lost by 52-44 Kurland, with 14 points, and Cecil Hankins, with 20, proved too accurate for the Blue Demons, whose attack bogged down when Mikan was ruled out on personal fouls after 14 minutes of action.

Pennsylvania carried off the Eastern Intercollegiate League crown to end Dartmouth's 7-year reign and the Quakers added to their laurels by conquering Army, 61-52, the setback being the first in 28 starts for the Cadets, who compiled a record of 30 victories against that lone setback over a span of two seasons.

Other college champions in 1945 were: Western Conference, Iowa; Pacific (Southern), U.C.L.A.; Pacific (Northern), Washington State and Oregon, tied; Big Six, Iowa State; Big Seven, Utah; Southwest, Rice; Southern, North Carolina; Southeast, Kentucky; Ohio Conference, Akron; Mason-Dixon, American U.; Southwest Border, New Mexico, and Missouri Valley, Oklahoma Aggies.

The G2 Depot quintet won the championship of American forces stationed in the United Kingdom, while Bainbridge, Great Lakes and Mitchel Field were among the service leaders competing at home. The Phillips 66 Oilers of Bartlesville, Okla., kept their national A.A.U. men's crown and the Nashville, Tenn., Convacs won women's laurels. The Philadelphia Sphas retained American League honors and the Fort Wayne, Ind., Zollners annexed the world professional title.

THOMAS V. HANEY.

BATTLE MONUMENTS COMMISSION, American. A Commission created by Congress in 1923 to erect, or control the erection of, monuments to the American forces in Europe during World War I, and to maintain the American national cemeteries and memorials in Europe. Chairman: Gen. John J. Pershing.

BELGIAN CONGO. Belgium's only colony, located in central Africa and embracing a large part of the

basin of the Congo River. Area, 902,082 sq. mi. Capital, Léopoldville.

Government. The administration is under the general supervision of the Belgian Minister of Colonies, normally an appointee of the King, and is assisted by a Colonial Council. At the head of the actual administration is a Governor-General, assisted by a Vice-Governor, state inspectors, and six provincial governors. The provinces are in turn divided into districts and these are subdivided into administrative territories. The frame of government is thus centralized, hierarchical and with little place for native participation.

The Congo is saddled with a large debt, though not unwieldy in view of the Colony's expanding economy. In 1939 the figures were: consolidated debt, 3,992,980,029 francs and floating debt, 480,004,400 francs, in addition to 1,368,957,250 francs of guaranteed capital. In 1944 government receipts were 1,765,683,000 francs and expenditures were 1,601,405,000 francs.

Events, 1945. The end of the war obliged the Congo authorities to seek ways and means for readjusting the colony's economy to a peacetime basis. The impetus of wartime needs had caused an increased production of such items as copper, pitchblende (from which uranium is extracted), rubber and palm oil. At the same time, local industries were expanded or created to provide goods which could no longer be imported, such as textile manufactures.

During the latter part of the year the Sabena Company, a Belgian concern, reopened its air services between the Congo and the mother country. At the same time shipments of coffee and palm oil to Belgium were resumed by sea. A permanent peacetime air connection with the United States seemed assured when an examiner of the Civil Aeronautics Board in Washington recommended that Pan American Airways, which had operated a service from Miami to Léopoldville from September, 1941, to August, 1945, be granted the only American certificate to operate into the Congo from New York via the Azores.

A Belgian field hospital with a native medical staff operated on the Chindwin front in Burma, alongside the African divisions from the British colonies.

Characteristics of the Population. The native population on Jan. 1, 1944, was 10,486,291. Whites numbered 34,888, of which two-thirds were Belgians. Most of the natives are Bantu and Sudan Negroes, with a few Nilotic tribes in the northeast and some Pygmies scattered in the interior.

The Belgians point with pride to the number of schools available for the natives. Most of these schools are provided by Christian missions, though many are subsidized by the government. In 1943 there were 5,413 subsidized primary schools (293,099 pupils) and 53 subsidized secondary schools (3,691 pupils). Not subsidized were 194 primary schools (42,222 pupils), 8,669 rural schools (238,342 pupils), and 22 professional schools (1,288 pupils). In general, instruction in technical fields is emphasized rather than in social or broadly cultural studies.

The great mass of the natives is still pagan. The work of the Christian missions is carried on by some 4,000 missionaries (three-fourths of whom are Roman Catholics), without whose activities the government would have been compelled to engage far more widely in educational and welfare work than is now the case. Compared with adjacent colonies, the Belgian Congo has in recent years enjoyed a reputation as one of the most progressive

in health and sanitary measures. The Belgians proceed on the theory that a healthy native population is an economically efficient one.

The Economy of the Country. The Belgian Congo is, industrially speaking, one of the most advanced colonies in Black Africa. The country is rich in mineral resources, fertile soil and potential water power (only 7 per cent of the colony's potential water power—second largest in the world—is now utilized). The natives have shown themselves readily adaptable to work in mines, factories and offices. The Belgian régime has also been very friendly to the introduction of outside capital. As a result the production of the Congo's plantations, mines and textile mills has been highly profitable.

Production figures for 1943 are as follows: rubber, 12,000 metric tons; peanuts, 50,000 tons; cotton, 43,000 tons; palm oil, 120,000 tons; copper, 156,850 tons; gold, 15,138 kilograms; diamonds, 4,882,000 carats (world's leading producer by weight); tin, 23,967 tons; as well as important amounts of manganese, zinc and iron.

The colony's foreign trade, much of which passes through the port of Matadi on the lower Congo, in 1943 amounted to: exports, 2,289,475,009 francs; imports, 2,905,604,082 francs. The United States and the United Kingdom each took 1,500,000,000 francs' worth of Congo products. The United States also provided imports worth 980,646,000 francs. The return of peace was, however, expected to alter the direction of the Congo's trade relations.

The Congo River and its larger tributaries are navigable for varying distances. The Congo itself is broken at several points by cataracts, around which railroads have been built. Navigable rivers total more than 7,500 miles, railways 3,106 miles, and roads 55,000 miles. Before the war the Congo was served by several international airways and possessed an extensive internal network operated by the Sabena Company.

Ruanda-Urundi, Territory of. These two districts, formerly part of German East Africa, were assigned to Belgium as a B Mandate after World War I. The Territory has an area of 20,152 square miles and a population of 3,775,335—one of the most dense in Black Africa. The capital is Usumbura. In 1925 the Territory was joined administratively with the Belgian Congo and placed under the direction of a vice-governor. In 1941 there were 3,601 mission schools with 236,920 pupils. Cattle-raising is important. The chief exports are cotton, coffee, hides and tin.

ROBERT GALE WOOLBERT.

BELGIUM. A kingdom of Western Europe. Capital, Brussels. King, Leopold III, who was crowned Feb. 23, 1934; he was a German prisoner-of-war from May 27, 1940 to May 8, 1945. (For his present status, see below under **EVENTS**) Regent, Prince Charles, Leopold's younger brother, who took the oath on Sept. 21, 1944.

Area and Population. The area of Belgium, including the districts of Eupen and Malmédy, is 11,775 square miles. The estimated population on Jan. 1, 1942, was 8,257,392. The people are of two distinct races, the Flemings, of Germanic stock and the Walloons, of Celtic or Alpine racial origin. French and Flemish are official languages. Estimated populations of the chief cities on Dec. 31, 1938: Brussels and suburbs, 912,774; Antwerp, 273,317; Ghent, 162,858; Liège, 162,229. Living births per 1,000 inhabitants numbered 15.3 in 1939, 13.4 in 1940, 12.0 in 1941, 12.9 in 1942, and 14.7 in 1943; deaths, 13.8 in 1939, 16.1 in 1940, 14.5 in 1941, 14.6 in 1942 (including military),

and 13.4 in 1943 (including military). The infant mortality rate per 1,000 live births was 73 in 1939, 85 in 1940, 84 in 1941, 78 in 1942, 68 in 1943, and rose to 77 in 1944. The death rate per 1,000 was 15.7 in 1944.

Government. The Constitution of 1831, as amended in 1921, vested executive power in the King, acting through a Ministry responsible to Parliament. See YEAR BOOK for 1940, for the governmental system existing at the time of the German invasion of May 10, 1940. For the establishment and composition of the Belgian Government in Exile during the war see YEAR BOOK for 1944, p. 66-67.

Education and Religion. Previous to the war there were (Jan. 1, 1939) 1,222,164 pupils in 13,438 elementary schools, 86,279 students in 273 secondary schools, and 10,775 students in the four universities at Brussels, Louvain, Ghent, and Liège. Roman Catholics form a large majority of the inhabitants who profess a religious faith. There is full religious liberty.

Events, 1945. For liberated Belgium, 1945 was a year of many and severe crises. Like other nations freed from the German yoke, Belgium learned the hard way that liberation is not enough; that it is merely the first stage in a long and painful process of political, economic, and moral recovery.

Victim to the Last. The classic victim of unprovoked aggression, Belgium was not spared the final spasms of war. Nazi Germany's last fling at offensive action, the Ardennes offensive of December, 1944, hit her with full force, adding more death and destruction to the grievous total sustained before liberation.

By the end of January, the "bulge" which the returning Germans had driven into southeastern Belgium had been wiped out, and Belgian territory had once more been cleared of the invader, but in the rear lay scores of wrecked Ardennes cities—Houffalize, St. Vith, Laroche, Bastogne, and Malmédy in particular—and thousands of civilian dead or wounded.

Even more destructive than the re-invasion of about one-fifth of Belgium's soil was the sustained robot-bomb offensive which the Germans directed at the great Belgian port of Antwerp in the last months of the war. From October, 1944, through March, 1945, Antwerp was subjected to continuous bombardment, on a larger scale than even London, by robot bombs and rockets. More than 2,900 persons were killed in the city of 600,000, and some 57,000 houses were damaged beyond repair. Militarily, however, the bombardment was a complete failure. Only 5 percent of the Nazi missiles hit the port area, where 30,000 dockers kept unloading ships, regardless of the bombs. Thus Antwerp became truly the key to Allied victory, speeding more than 2,000,000 tons of supplies to the fighting lines. Liège also was hard hit by rockets and robot bombs, losing 27,000 houses in three months, and 1,045 killed.

Change of Government. Even before the military danger to Belgium had been removed completely, the political crisis which had been simmering since liberation (see 1945 Year Book) erupted again. Nation-wide dissatisfaction with Prime Minister Hubert Pierlot's handling of such matters as the purge of collaborationists, and the bid of the Resistance movement for a greater share in the administration, was enhanced by the sad state of economic affairs (see below).

Early in February the Pierlot Cabinet resigned after having grappled for four months with the problems of liberation. Prince Regent Charles's

choice then fell upon the dynamic Socialist leader Achille van Acker, author of a Belgian "Beveridge Plan," who had held the portfolio of Labor in the fallen Cabinet.

On Feb. 11 Premier van Acker formed his government, after overcoming the reluctance of the influential Catholic Party to enter a coalition including the Communists. The new Cabinet, comprising representatives of all four parties (Catholics, Liberals, Socialists and Communists) marked a decisive swing to the left, and a radical break with the old London group, of which only one member, Foreign Minister Paul-Henri Spaak, was retained. Conversely, the Resistance movement, to which van Acker himself belonged, was given increased representation.

The Constitutional Crisis. Hardly was the war won, and the political picture straightened out, when Belgium found herself enmeshed in a most serious constitutional crisis. It began the moment it became known, on May 8, that King Leopold III and his wife, Princess Rethy, had been freed from Nazi captivity near Salzburg, Austria.

Immediate and widespread opposition arose against the King's possible return to Belgium. It is important to emphasize that this movement, centered chiefly in the Socialist and Communist parties, and generally in the former Resistance, was not aimed at the institution of monarchy, or at the Saxe-Coburg dynasty *per se*; it was not an issue between monarchists and republicans, but between a headstrong, egocentric ruler, Leopold III, and his people. *L'affaire royale* never involved the King's brother, Charles, who had been installed as Regent in September, 1944, nor the heir apparent, the 15-year-old Prince Baudoin, both being truly popular in Belgium.

The objections raised by "The King's opposers" against Leopold personally were many and varied, the principal charges being that (a) his capitulation in May, 1940, was deliberate and premeditated; (b) that he had evinced, even before the war, pro-German and pro-Fascist sympathies; (c) that, contrary to his claims, he had not, under German rule, lived and behaved as a prisoner of war, since he twice visited Hitler in Berchtesgaden and even married again in captivity; (d) that he had been formally deposed by his Cabinet on May 30, 1940.

On May 10, Prince Charles, Premier van Acker, and other Belgian political personalities arrived by airplane at Villa Auhof, St. Wolfgang, Austria, where the King had been living "as a guest of the American Army" since his release from German captivity. The Premier later explained that his intention on this first of four flying visits to St. Wolfgang originally had been to take the King back to Brussels, but that he subsequently had changed his mind when he found that the events through which Leopold had lived had deeply affected his character; he hinted at a neurotic instability of mind which made the King unfit to govern.

Thus, when van Acker announced on his return to Brussels, on May 13, that the King would not be back for some time because of ill health, he was not really feigning "diplomatic illness," but was speaking the truth, though he did not specify at the time what ailed Leopold.

In the following weeks, however, it became amply clear that a majority of the population would not welcome Leopold back to the throne, even if he were in the best of health. One after another, the political parties in Parliament, with the single exception of the Catholics, went on record against a return of the King.

This widespread opposition notwithstanding, Leopold let it be known, in mid-June, that he had fully recovered and was prepared to resume his royal functions. In emphatic protest against this decision, Premier van Acker and his Cabinet on June 16 presented their resignations to the Prince Regent. A communiqué declared the Government could not "take responsibility for political events that inevitably will happen as soon as the King returns." This was taken to mean that there would be mass demonstrations and possibly grave disorders if the King, overriding the advice of the Cabinet, returned to Brussels.

Thus the crisis at last was out in the open. Public clamor for the King's abdication became more frequent and insistent. In the Walloon parts of the country, where Leopold was particularly unpopular because of his allegedly anti-French feelings, demonstrators shouted "Death to Leopold! Hang him!"

But the lonely exile at St. Wolfgang was not yet prepared to give up his throne. Even as the tendered resignations of the van Acker Government lay on the desk of the Regent, Leopold summoned various political leaders to his residence in an attempt to form a new Cabinet. Former Premier Paul van Zeeland, a Catholic, and Lieut. Gen. Ganshof van der Meersch, hero of the underground, were among those called by the King but both declined in view of the threatened complications at home. The powerful trade unions had made it clear by that time that they would call a general strike if Leopold returned.

Meanwhile, van Acker's Cabinet carried on, the Regent having in effect refused to accept its resignation, and on July 16 it was announced that the ministers would remain in office. The Premier declared that Leopold, though refusing to abdicate, had agreed not to return for the time being.

The King's stubborn fight for his throne thus ended in a provisional stalemate but it had the unwelcome effect of disrupting the national unity which van Acker had so laboriously cemented at the advent of his regime. Indeed, on July 17, the six representatives of the Catholic Party withdrew from the Cabinet in protest against the stand taken by the Premier and a majority of his ministers in the *affaire royale*. The Catholics then returned to the opposition in Parliament, leaving a virtual "popular front" regime in power.

Within a few hours of this split, the Chamber of Deputies voted by overwhelming majority to bar Leopold from returning to his throne without the consent of Parliament; a special act extending Prince Charles' regency for an indefinite period was passed by a vote of 98 to 6, with 32 members abstaining. The following day, July 18, the Senate ratified the action, though by a narrower margin: 77 votes were cast in favor of the measure, and 58 against it, five abstaining.

Thus the issue was closed to all practical purposes, but the heated debate in Parliament continued for a few more days. On July 20, Premier van Acker, in a two-hour address to the Chamber, substantiated most of the charges that previously had been levelled at Leopold. While refusing to consider the King a "traitor," van Acker found it intolerable for him to resume the throne, in view of his many past errors of judgment and his impaired health.

An even sterner indictment of the King was laid before the Chamber on July 24 by Foreign Minister Paul-Henri Spaak who charged Leopold with having been a defeatist in 1940 and also attacked the King's British military adviser at the time, Admiral

Keyes. M. Spaak introduced into the debate a hitherto unpublished letter written by Leopold on Jan. 25, 1941, in which the King severely criticised his ministers who had continued the fight in exile. "If Belgium survives today," declared M. Spaak, "it is because we disobeyed the King at that time. All those who carried out sabotage during the occupation, or worked against the Germans, likewise disobeyed the King." And he concluded: "Leopold no longer can be accepted as a symbol of unity."

On July 26 the Chamber closed the debate by a 95 to 68 vote in support of the Government. The long-drawn-out crisis thus ended in a draw. The King remained in Austria, to all practical purposes an exile, Prince Charles stayed as Regent, and the van Acker regime continued in office, minus its former right wing. Both factions left it up to the people to decide at the elections scheduled for March, 1946, whether or not Leopold should return to his throne. Toward the end of August it appeared that the King had resigned himself to a long exile; through a personal secretary, Prof. Jacques Pirenne, he applied for permission to enter Switzerland and take up residence there.

The King's application was granted by the Swiss Government, and on Sept. 29 Leopold and his suite crossed the border from Austria. Two days later the party arrived at Pregny, on the Lake of Geneva, where a villa had been prepared as future residence for the exiled monarch.

Soon, however, it became clear that if Leopold had abandoned his plans for an immediate return to Belgium, he had by no means accepted final defeat yet. For, even as the King arrived in Switzerland, a royal proclamation was released in Brussels by the semi-official Belgian News Agency in which Leopold once again defended his record under the Nazi occupation and made a new bid for his throne. Declaring that since his capitulation in May, 1940, he had "done nothing else" but resist the Germans, Leopold concluded his proclamation with these words: "Since the beginning of my reign, my only ambition has been to serve my country. Tomorrow, as yesterday and today, I shall remain faithful."

Premier van Acker promptly took up the challenge. In a speech to the Senate he asserted that the Government had in its possession evidence of Leopold's belief in a German victory and of a voluntary meeting with Hitler at Berchtesgaden. The document on which this assertion was based was made public on Nov. 2. It turned out to be a detailed account of the much-discussed Berchtesgaden meeting, in November, 1940, written by Dr. Paul Schmidt, Hitler's personal interpreter. According to Schmidt's account, Leopold "thanked the Fuehrer for all he had done up to the present for Belgium." Schmidt also quoted the King as having declared that "he entered this conversation with the Fuehrer in full confidence because he knew how to appreciate the great work the Fuehrer has undertaken and knew his wish to give Europe a durable peace based on justice, collaboration and understanding between peoples. With such a program the Belgians would certainly cooperate." The King also was said to have urged Hitler to counter-act British radio propaganda in Belgium.

In releasing Schmidt's memorandum to the press, after a translation of it had been forwarded to the King in Switzerland, van Acker emphasized that the authenticity of the document was not in doubt since it had been recovered by the Allies in German archives. Nevertheless, Leopold vigorously denounced the memorandum as biased, declaring that Hitler's words had been attributed to him.

On Nov. 10, the Catholic Party, headed by Ed-

mond Ronsé, renewed its attacks on the Government in a passionate parliamentary debate, while the conservative press denounced what it termed a scandalous political campaign against the King. The two-day attempt to overthrow the van Acker Cabinet broke down again, as the Senate on Nov. 12 gave the Government a 69 to 35 vote of confidence. This new defeat, however, also failed to shake the royalists' conviction that Leopold would return after the general elections in the spring of 1946.

Economic Recovery. The fall of the Pierlot Cabinet was due primarily to its inability to cope with the tremendous economic problems that arose from liberation. At the start of the year the outlook was sombre indeed. Food was scarce and consumer goods were not available except at exorbitant prices. Badly needed supplies from abroad were slow in arriving and fell far short of expectations. The country's transport system was overburdened by the exigencies of the Allied armies. Cold weather, freezing the canals, added to the difficulties. As a result, industry could not get going, and unemployment was widespread for months.

With the advent of the van Acker Government, matters showed a tendency to improve. Coal deliveries increased, and by the end of March the output of electricity was large enough to maintain the supply of current day and night. The number of unemployed was reduced by 100,000 in two months. The end of the war in Europe brought further improvement, especially in transportation and foreign trade. In June, civilian mileage on Belgian railroads for the first time exceeded that of the military, if only by a small margin.

Throughout the summer, however, the Belgians complained that their allies were hampering, rather than helping, the country's economic convalescence. There was dissatisfaction in Brussels, in particular, with the slow and cumbrous functioning of lend-lease machinery. It was pointed out—and the Foreign Economic Administration in Washington confirmed this—that reverse lend-lease by Belgium was about four times as great as American lend-lease aid to that country.

Indeed, goods and services supplied by Belgium—especially through the Allies' use of port facilities in Belgium—were valued at \$67,500,000 by May 31, as compared with only \$14,166,000 worth of American lend-lease exports to Belgium by May 1. As the United States' indebtedness to Belgium mounted, the press and public clamored for cash payments wherewith to buy American goods not obtainable under lend-lease.

In an attempt to cope with the tremendous public debt, which in four and a half years of German occupation had risen from 66 billion francs to 156 billion, the van Acker Government introduced a drastic program of taxation. The new financial plan provided, among other things, for total confiscation of all benefits made during the period of occupation on deliveries to the enemy, and a tax of from 70 to 95 percent on excess profits made during the same period on business not involving the enemy. At the same time, the Government partially lifted the restrictions placed on all bank accounts immediately following liberation.

The steady progress of economic recovery was highlighted by an official report on Sept. 23 that, in spite of demobilization and the repatriation of 100,000 former prisoners of war, the number of jobless had fallen from 300,000 in February to 110,000 in September. By that time, coal production had reached about 70 percent of prewar figures, while electric service was almost normal.

On Oct. 20 it was announced in Washington that an interim settlement of lend-lease relations between Belgium and the United States had been reached. Under this agreement, the United States recognized that Belgian reverse lend-lease to date exceeded lend-lease aid by \$90,000,000 and promised to settle this amount in the near future, partly in cash, partly by transfer of surplus property in Belgium, and partly through deliveries of raw materials and other goods ordered by Belgium in the United States.

The Purge. The new Government pursued with vigor the purge of traitors and collaborationists which had lagged under the Pierlot regime. Among prominent collaborationists arrested during the summer were Gerard Ronsée who had served the Nazis as "Minister of Interior," Raymond de Becker, German-appointed editor of *Le Soir*, and Gen. Lambert Chardonne, accused of having recruited men for the traitorous Rexist movement.

The leader of the Rexist, Léon Degrelle, however, managed to escape Belgian justice, at least temporarily. Degrelle, who had served with the German Army on the eastern front, fled from the Stettin sector in a Nazi plane which crash-landed on a beach near San Sebastian, Spain, on May 8. Slightly injured in the crash, the Belgian Fascist leader was interned by Spanish authorities, who rejected, however, a Belgian request for extradition on the grounds that Degrelle was a political refugee. On July 29 it was learned in Madrid that an unsuccessful attempt had been made to kidnap Degrelle from the military hospital at San Sebastian "for a one-way ride across the French frontier."

Up to June 1, 1945, out of some 70,000 persons arrested on charges of collaboration with the enemy, 8,538 were held in jail and 19,736 in internment camps. Belgian courts by that time had sentenced 1,150 persons to death, most of them *in absentia*; prison sentences had been imposed on 5,284 persons, including 1,656 cases of judgment *in absentia*. The death sentence was executed in 33 cases.

After liberation, the Rexist and the Flemish Nationalist parties were outlawed, and their representatives were deprived of their seats in Parliament. The resulting reduction of members, from 202 to 181 in the Chamber, and from 167 to 151 in the Senate, materially strengthened the leftist and anti-Leopold tendencies in Parliament.

Production. Previous to the war Belgium's manufacturing, mining, intensive agriculture, and extensive foreign commerce enabled it to support one of the densest populations of Europe (712 per square mile on Dec. 31, 1938). The area under cultivation was substantially expanded in 1941 and 1942, but showed a marked decrease in 1944 and 1945. Leading crops are wheat, rye, oats, potatoes, and sugar beets. Cattle numbers increased in 1945, approaching 1939 levels. On May 15, 1945, there were 780,556 dairy cows, 621,328 pigs, and 282,502 horses. Production of meat fell in 1944 to less than one-third of the prewar output; that of butter, margarine, and sugar also showed a marked decrease. Belgium possesses large mineral resources, especially coal, iron, and zinc ores. The average monthly output of coal was reduced from 1,979,000 metric tons in 1943 to 1,125,000 in 1944; that of pig-iron from 136,000 to 59,000 tons. Belgium also was an important prewar producer of glass, paper, cardboard, cement, cotton yarn, rayon, metal products, alcoholic beverages, etc.

Foreign Trade. Belgium's foreign commerce in

terms of money was drastically reduced during the war, from an average of 3,700,000,000 francs per month in 1939 to 750,000,000 francs in 1944. The decrease in quantity was even greater if the rise of prices during that period is taken into account. Imports in 1944 averaged 305,000,000 francs a month, exports 452,000,000.

Finance. The note circulation was 100,000 million francs in August, 1944. The Belgian franc was fixed at 176.6 to the £ sterling on Oct. 5, 1944. Belgium's domestic debt, rising steadily, reached 187,000 million francs in September, 1945.

JOACHIM JOESTEN.

BILLIARDS. Welker Cochran of San Francisco retained his world three-cushion title by defeating Willie Hoppe, the ageless cue artist from New York, 4,819 to 4,771 in a 90-block cross-country challenge tournament. The two stars played in thirteen cities from New York to San Francisco.

Willie Mosconi was the top man in pocket billiards for the second year in a row, the Toledo, Ohio, ace keeping his laurels when he turned back the challenge of the veteran Ralph Greenleaf of Detroit. The national amateur three-cushion crown was annexed by Edward Lee of New York.

THOMAS V. HANEY.

BIRTH CONTROL. A permanent injunction restraining U. S. Postmaster General Frank J. Walker from interfering with the mailing of the Consumer's Union *Report on Contraceptive Materials* was issued in March by Judge T. Alan Goldsborough of the United States District Court of Appeals. The injunction concluded a four-year action in the courts.

In May Mr. Walker was further overruled from barring Paul Popenoe's pamphlet, *Preparing for Marriage*, from the mails. The decision, said by a post office attorney to be "tantamount to a judicial repeal of the 72-year old (Comstock) law," upheld the Appellate Court's ruling that the Postmaster General had no power on his own judgment to exclude any publication from the mails without a hearing.

In Connecticut, the state legislature again defeated a bill which would permit a physician to prescribe birth control methods for married women when a question of health was involved. The bill was defeated by failure to report it out of committee. Two years must elapse before such bill can be reconsidered.

Previous to the defeat of the bill a statewide poll had disclosed an overwhelming majority, 85 percent of adult voters, in favor of birth control legislation.

Activities of the Planned Parenthood Federation. At the 24th Annual Meeting of the Planned Parenthood Federation of America held in New York City, Rev. Cornelius P. Trowbridge, rector of the Church of the Redeemer, of Chestnut Hill, Mass., was elected President of the Federation to succeed Dr. J. H. J. Upham, who assumed the chairmanship of the National Medical Council.

Forty of the city's most distinguished physicians at the Annual Dinner discussed "Responsibility for the Health of Tomorrow's Family." Dr. R. C. Williams, Assistant Surgeon General, United States Public Health Service, announced the Service's policy on child spacing—"any state deciding to develop a planned parenthood program could expect from Public Health Service the same consideration that would be given to any other proposal in connection with state health work."

Two \$500 awards of the Albert and Mary Lasker

Foundation were presented to scientists who had made the most significant contribution to research in the field of infertility and contraception. Dr. John MacLeod, Department of Anatomy, Cornell University Medical College, received an award for research in the motility of the human sperm. Dr. Felix J. Underwood, Health Officer of the Mississippi State Health Department, received the award for his contribution to better maternal and child health by including planned parenthood in the State public health program.

Before a luncheon audience of 1,300, Mrs. Franklin D. Roosevelt addressed a Symposium of representatives of eleven public and private agencies whose mutual interests share a concern for the well-being of the American family. Included in her address, which was carried over a nation-wide network, was an endorsement of the planned parenthood movement. In a subsequent interview, reported in a nationally circulated magazine, Mrs. Roosevelt reiterated her attitude toward planned families.

Planned parenthood services for Negro groups expanded considerably during the year. Full time Negro consultants have been added to staffs of Illinois, Maryland and Washington, D. C., leagues. Plans to include discussion of child spacing in the year's programs of the National Congress of Colored Parents and Teachers were formulated. Miss Mary E. Langford was added to the Federation's staff as field consultant on Work with Negroes. She has initiated and carried out demonstrations in various areas of the country. In October the Hannah Stone Planned Parenthood Memorial Center opened in Harlem, New York's congested Negro center, where the stillbirth and infant death rate and maternal mortality is three times that of any other section of the city. Offsetting such needed service was the closing in Philadelphia of the Maternal Health Center in the Douglas Hospital.

1945 witnessed a growing cooperation with mental and tuberculosis hospitals. Miss Lillian W. Turnbull, recently appointed State Director of the Iowa League for Planned Parenthood, reported cooperation with three of the State's mental hospitals whereby instruction in birth control became a part of the routine of discharging patients. Likewise patients on leaving the State Tuberculosis Sanatorium are referred to the Iowa City Clinic for contraceptive instruction.

With growing awareness that the minister is the key person to guide a program of marriage education and counselling, the National Clergymen's Advisory Council published a syllabus on such matters for use in seminaries, community training schools and by individuals interested in marriage and family counselling.

Latest reports indicate that Planned Parenthood services are now available in 599 active clinics; 241 are located in public health departments; 65 in hospitals; 256 in extra-mural clinics, and in 37 communities where no clinic exists, a referral system cooperated with local physicians.

Fertility Clinics have been added to the services of a number of clinics during the year; in the Chicago clinic over 100 women received treatment for infertility. Basal temperature charts to aid in determining optimum fertility in individual patients, together with patient instruction, were made available to clinics and private physicians.

Important among the publications of the year is the reprint of Dr. Jacob Yerushalmy's study of 7,000,000 births. Dr. Yerushalmy, chief statistician in the United States Public Health Service, con-

cluded from his study that the country's high still-birth rate could be lowered by properly spacing the time between births. The Federation's pamphlets, *The Soldier Takes a Wife*, addressed to the returning soldier, *Planning to Have a Baby?* and *Population and Peace* were the year's best sellers. Mailing lists included clergymen, physicians, public health officials, public and school libraries, teachers, hospital nurses, professors of economics, key "opinion makers," writers, authors of medical and nursing textbooks and thousands of individual requests for literature from every state in the union. During 1945 more than sixty articles favorable to the program of Planned Parenthood appeared in popular and professional magazines with national and state circulation. Polls taken throughout the year in schools and colleges have indicated an overwhelming number of youths in favor of sex education, including birth control information as a "practical help in preparation for marriage." A fifteen minute radio transcription of *Am I My Brother's Keeper?* dramatized by nationally known radio performers, was made available to all Planned Parenthood centers. Many leading radio stations throughout the country have included on their programs a discussion of the Federation's program.

FOREIGN REPORTS

China. Resolutions favoring birth control were passed by the Kuomintang, the Chiang Kai-Shek ruling party. "Eugenic measures" adopted by the party congress were far more advanced than that of any western power and became part of a post-war program.

Japan. Japanese leaders announced a definite program of birth control as solution to overpopulation. Baroness Shizuyo Ishimoto, long advocate of birth control for her country, has been named candidate for the lower house of the Diet. If elected she will seek to promote a planned parenthood policy and a democratic way of life for women.

Russia. While not banning the use of contraceptives, Russia embarked upon a "baby incentive" program to offset her war losses. Prizes and cash allowances were given to mothers as stimulus to large families.

Egypt. The Grand Mufti's decree that birth control was legally and religiously permissible to Moslem people was recently made known to the Western world in a translation from the Arabic.

France. The French Government was reported to have ordered vast quantities of testosterone (male hormone) for treatment of devitalized French soldiers returning from German prison camps.

India. Dr. Gyan Chand, Professor of Economics, Palna College, recommended birth control as part of a national health service to meet a birth and death rate, one of the highest in the world.

Canada. In July, a generous program of "baby bonuses" was instituted throughout the Dominion.

D. KENNETH ROSE.

BOBSLEDDING. The Mount Van Hooevenberg Olympic run at Lake Placid was closed during the war, but plans for its reopening and the resumption of title racing were given impetus near the close of 1945 when Gov. Thomas E. Dewey and legislative leaders approved the expenditure of \$12,000 to recondition the big New York slide.

No competition has been held since 1942, when the following champions were crowned: Jimmy Bickford and Bill D'Amico, North American two-man team; Jimmy Bickford, Hugh Bickford, Dick Morse and Lou Miron, North American and national A.A.U. four-man team; Bud Washbond and

Nick Ruscitto, national A.A.U. boblet, and the Bickfords, national two-man bob team.

THOMAS V. HANEY.

BOK FOUNDATION. The Mary Louise Curtis. A philanthropic organization which has as its principal activity the support of the Curtis Institute of Music in Philadelphia. Grants have also been made to the Settlement Music School, Philadelphia, and the Research Studio, Maitland, Fla., the latter being a kind of "laboratory" for painting. Financed by gifts of \$12,500,000 from Mrs. Mary Louise Curtis Bok, the Foundation was created in 1931 for the support of music, fine arts, science, invention, or general education. Address: 1726 Locust Street, Philadelphia 3, Pa.

BOLIVIA. A republic of South America. Area: 416,040 square miles. Population 3,533,900 (1942). Capital: Sucre is the seat of the Supreme Court and nominally the capital, but La Paz, the largest city, is the actual seat of the Government.

About three-fifths of Bolivia is composed of tropical lowlands, the remainder of high plateaus and mountains. Humid tropical climate prevails in the lowlands, temperate in the plateau areas, and varying extremes of cold at altitudes above 13,000 feet.

Government. Bolivia is a centralized republic of 9 Departments, under the Constitution of 1938, which was amended by a Constituent Assembly elected in July 1944. The Constitution provides for a bi-cameral Congress: a Senate of 27 members (3 from each Department), elected for 6-year terms, one-third elected every 2 years; and a Chamber of Deputies of 110 members, elected for 4-year terms, one-half retiring every 2 years. Regular sessions of the Congress open on August 6 of each year for a 60-day period, which may be extended to 90 days when desired. The President is elected for a 6-year term, and is assisted by a Cabinet of 9 ministers.

The Constituent Assembly confirmed President Gualberto Villarroel, who had assumed the presidency in December 1943 as a result of a coup d'etat which overthrew the government of President Enrique Peñaranda del Castillo.

Events, 1945. Bolivia was in a critical political situation at the turn of the year, as liberals in the other American countries, the opposition within Bolivia, and Bolivian exiles abroad opened fire on the new Government which had been set up on the last day of 1944. The year's-end shakeup had restored the allegedly pro-Nazi Nationalist Revolutionary Movement (MNR) to power, with its leader, Victor Paz Estenssoro, in the post of Finance Minister, although elimination of MNR influence had been one of the conditions on which the other American republics had recognized the regime of President Gualberto Villarroel in mid-1944.

The Government in La Paz was officially silent in the face of charges of double dealing, but its supporters argued that the Army did not wish to continue governing indefinitely, and that it had no other choice but to call on the country's largest party and the one with the heaviest representation in the Constituent Assembly. It was only because the Government had made it so that the MNR was the dominant party, the opposition countered.

Enemies of the Villarroel regime found an immediate issue in the fate of the aged Senator Luis Calvo, Genuine Republican, and Senator Felix Capriles, Unified Socialist, who had been missing since the November 1944 uprising in Oruro. Late in January the bodies of the two senators were

found at the bottom of a ravine on the road to Yungas, near La Paz. Their hands had been tied behind their backs and their skulls crushed. The opposition charged that they had been murdered by the Government. This issue continued to agitate the country throughout the year; as late as November 21 a minority bloc in the Constituent Assembly paid posthumous tribute to Calvo and Capriles.

Reports on conditions within censorship-shrouded Bolivia varied widely during the early months of the year. Exiles, representing both rightist commercial and industrial interests known to Bolivians as *La Rosca* (the Ring), and the Leftist Revolutionary and Communist parties insisted that the Villarroel regime was fascist and was carrying on a reign of terror. Other observers reported that conditions were fairly normal and that the more severe repressive measures had ended with the liquidation of the November revolt. They stressed the nationalistic and socialistic character of the Government and its determination to brook no serious opposition, but saw signs that it was adopting a less extreme position than at the beginning of its power. On February 16, President Villarroel signed a decree lifting the state of siege; and a crisis within the MNR led to the expulsion of reportedly pro-Nazi Dionisio Fojanini as a "traitor."

The exiles continued their opposition, however. Exiled leaders of five political parties cabled the Mexico City Inter-American Conference on Problems of War and Peace from Chile to call attention to the "bloody deception" by which the Villarroel regime had won diplomatic recognition.

And in June the Bolivian Democratic Union organized in La Paz in 1944 was reorganized in Santiago, Chile, to include the same five parties: Liberal, Genuine Republican, Republican Socialist, Unified Socialist, and Leftist Revolutionary (PIR). The coalition denounced Villarroel's regime as terroristic and Nazi-Fascist and pledged itself to carry on an open and relentless battle against it. Luis Fernando Guachalla, former Bolivian Ambassador in Washington, was elected president of the Bolivian Democratic Union. (Late in September the Republican Socialists reiterated their opposition to the Villarroel Administration but withdrew from the UDB.)

Bolivia witnessed a strange political interlude when on March 12, according to an official announcement, several men ambushed and fired on an official car in which Villarroel and his family were driving between La Paz Heights and the city. One bullet struck the car but the rest went wild, it was said; the assailants were arrested.

A few days later the Government issued a correction: "The act was committed by persons without any political affiliation who, being in a state of drunkenness, tried to halt the automobile in order to get transportation back into town. They have been placed at the disposal of ordinary authorities for attempts against the public safety." The men arrested were reported freed on March 28.

The Constituent Assembly was scheduled to convene at the beginning of July but was unable to do so for two days because of lack of a quorum.

On the second attempt, only 66 of 137 legislators appeared, including members of the MNR and a few others; a majority of the opposition delegates were no longer in the country. The session finally got under way on July 4.

On July 5, Interior Minister Edmundo Nogales denied rumors of unrest, declared that domestic tranquility was a necessary prerequisite to eventual retirement of the Army from the Government and

establishment of rule by political parties, and guaranteed administration aid in the reorganization of political groups. The opposition, he charged, was carrying on a campaign of agitation and subversion.

One of the first acts of the assembly was to approve unanimously a general amnesty decree covering "all persons involved in political crimes," including participants in the previous November's abortive uprising. Villarroel declared on July 26 that he would approve the measure, but he pledged "vigorous and energetic defense" of the principles of the December 1943 revolution which had placed him in power. A month later PIR leader Ricardo Anaya, exiled in Chile, stated that the first of that party's leaders to test the amnesty by returning to Bolivia had been arrested.

Altering an earlier schedule, the assembly agreed on August 1 to remain in session until the end of the year and to reconvene as a regular congress on August 6, 1946. On October 9 it prepared to transform itself into a congress by drawing lots to eliminate 64 members. Those eliminated included 29 MNR members, 16 independents, 9 Liberals, 8 independent Socialists, 1 Genuine Republican, and 1 member of the PIR.

The assembly on October 31 elected Jesus Montellano Vice President of the republic, and it adjourned *sine die* on November 24. President Villarroel and Vice President Montellano solemnly swore to comply with the constitutional reforms adopted by the assembly, which included: women's suffrage in municipal elections; a six-year presidential term instead of four; freedom of labor unionization; juridical equality of husband and wife before the law; recognition of common-law marriages after two years; and authorization to the Government to establish export monopolies in certain raw materials.

Another factor arose to plague the Villarroel Administration as the year neared an end. For months the President had been trying to win the support of the Indian masses of Bolivia by promising them land and the abolition of forced labor.

Some of them took him literally and tried to seize land. Bloody clashes resulted which intensified the problems of the Government, already serious enough because of the bad economic situation. And in the last weeks of 1945 the four parties of the Bolivian Democratic Union again reorganized their coalition, re-naming it the Democratic Anti-Fascist Front and issuing a fiery manifesto against Villarroel.

Economic Conditions. Mounting living costs kept Bolivia in a precarious economic state during 1945; economic pressure contributed largely to the instability of the Government.

President Villarroel high-lighted one of the country's basic economic problems early in January, when he declared that it was necessary for the nation to feed itself before it could be free to carry out social progress. He outlined a program for the systematic development of the cattle industry and wheat farming, and a few months later the Government put forth a postwar economic plan which included: (1) restrictions on the circulation of foreign exchange, to build up reserves; (2) encouragement of domestic industry; (3) integration of the eastern departments into the national economy so that the tin industry could be supplemented as a source of national wealth by oil and agriculture. On March 28 it was announced that the Bolivian Development Corporation and the United States Export-Import Bank had granted an estimated \$360,000 in credits to local industries

to aid them in reducing the republic's needs for imported food, particularly fruit and meat. "The time is short," Finance Minister Paz Estenssoro told a correspondent, "and if we do not set up our own industry and grow our own food, then Bolivia might become a ghost country."

But tin was still the mainstay of the Bolivian economy, and the end of the war in Asia and the prospective reopening of Far Eastern mines lent a sense of urgency to the country's economic planning which was reflected in the political tension. Cabinet ministers believed that they had about two years in which to put their economic house in order before the Malayan tin mines were again shipping to the western world. It was a gigantic task, and the determination of the ruling soldiers and nationalistic, socialistic members of the MNR to accomplish it against any opposition may have explained some of the ruthlessness of the Government.

The Foreign Economic Administration in Washington announced late in February that it had signed a new tin contract with Bolivia. It provided a 3½ cents per pound price increase for the balance of the life of the basic tin contract; a retroactive increase of 2 cents a pound for the period, July-December 1943; a new schedule of smelter charges; and maintenance of standards of health and working conditions for labor.

On February 11 the Villarroel Government approved a 1945 budget of an estimated \$25,040,000, including: \$5,300,000 for the armed forces; \$1,740,000 for the Interior Ministry; \$600,000 for the Foreign Ministry; \$3,620,000 for education; \$920,000 for labor; \$1,660,000 for public works; \$480,000 for agriculture; \$700,000 for communications; and \$1,720,000 for "obligations of the state."

Reviewing his 21 months in office, President Villarroel declared in October that his administration had curbed inflation, stabilized the currency, aided agriculture and industry, and advanced social reform. Nevertheless, on November 22 he found it necessary to warn the country to prepare to face an acute economic crisis in 1946. The national budget would be reduced by about one-sixth, he declared, and he expected every Bolivian family to reduce its own expenditures. He foresaw no improvement until the end of 1947, when the measures the Government was taking should have effect.

Foreign Relations. Although liberals in the other American republics were critical of the character of the Bolivian Government, there was little formal change in relations between La Paz and other capitals during 1945.

The keynote of Bolivian-United States relations was sounded early in January, when the Bolivian Ambassador in Washington, Victor Andrade, said that the return of the MNR to the Government would not mean a change in its policy of cooperation with other countries of the hemisphere. On the same day, officials of the United States Department of State asserted the same thing.

The United States scored a diplomatic success early in the spring, when it shipped 10,000 tons of wheat to Bolivia to relieve a shortage caused when alleged transportation difficulties held up a wheat shipment from Argentina. It was announced on July 26 that the Bolivian Development Corporation had signed a \$500,000 contract with a United States firm for construction of a highway between Cochabamba and Santa Cruz.

Relations with Argentina, traditionally determined on hegemony over its weaker neighbor, preoccupied the Bolivian Foreign Ministry.

The most active issue between the two countries was that of smugglers who were trying to run rubber into rubber-hungry Argentina. Early in March the Ministry of Agriculture reached an agreement with the United States Rubber Development Corporation to control this smuggling, which was draining away rubber needed for the war effort of the United States. The agreement provided for transit permits for rubber shipments within the national territory, careful watch on the frontiers and declarations by producers of all stocks on hand.

In return, the Bolivian Government was to receive \$30,000 to fight smuggling and \$200,000 to increase rubber production.

On April 17, President Villarroel, other Bolivian officials, and Argentine representatives attended the opening of an Argentine Industrial Exposition in La Paz. The fair drew praise from the local press; *La Calle* declared that "the public has been impressed by the enormous program of Argentine agriculture, stock raising and manufacturing." The exposition closed in the middle of May, after having been visited by some 62,000 persons.

This effective Argentine propaganda was backed up by action. On May 31, the Bolivian Government published a decree authorizing the establishment, in La Paz, of a branch of the Argentine National Bank, and a week later President Villarroel announced a program of economic collaboration with Argentina, calling for a large Argentine investment in the development of Bolivian oil and joint completion of the Yacuiba-Santa Cruz railroad. Villarroel told the press on July 20, that Bolivia was then sending 120 cubic meters of petroleum daily to Argentina, and that this amount would shortly be increased to 150 cubic meters.

At the same time, the Bolivian Government counteracted Argentine imperialism by dealing with Argentina's rival, Brazil. During the spring Foreign Minister Gustavo Chacón visited Rio de Janeiro and brought back an agreement which covered: (1) a method of financing the projected Vilavila-Santa Cruz railroad; (2) speeding of construction of the Corumba-Santa Cruz railroad; and (3) intensification of oil exploration in eastern Bolivia.

The perennial Pacific seaport issue between Bolivia and Chile became active again when Victor Andrade, Bolivian delegate to the United Nations Conference at San Francisco, expressed the hope that at some time in the future the Assembly of the world organization might study the possibility of revision of the 1904 treaty by which Bolivia had lost her seacoast to Chile. The hope was repeated in La Paz and the Chilean press, as usual, rose to the bait, but no action was taken and the furor died down by the end of the year.

Other 1945 developments in Bolivian foreign relations: In September, the Constituent Assembly approved six commercial, cultural, and transportation conventions which had been negotiated with Paraguay in 1939, and later that month President Villarroel paid a state visit to Paraguay; establishment of diplomatic relations with the Soviet Union was formalized on April 19; Bolivia severed diplomatic relations with the Franco Government of Spain on September 31, because of Spanish "hostility" to the democratic allies during the war.

The People. Over half of the total population of Bolivia are Indians; 32 percent are of mixed blood; 13 percent are of European descent (chiefly Spanish). Density of population per square mile ranges from 0.6 in the tropical lowlands to 28.5 in the area of Cochabamba. Largest cities are: La Paz, 301,000; Cochabamba, 60,000; and Oruro, 50,000.

Spanish is the official language, but in Indian communities native dialects are spoken.

The State religion is Roman Catholic, but other faiths are freely tolerated.

In 1939 about one-fifth of the population over 7 years of age was estimated to be literate. Primary education is now free and compulsory. In 1942 there were 1,766 primary schools with a total enrollment of 160,283; in 1941, 77 secondary schools had a total enrollment of 11,255. There are 6 universities in Bolivia.

National Economy. Mining is the outstanding industry of Bolivia. Tin is the most important mineral produced, although production is expensive because of the complex nature of the ore. During the period 1938-41, minerals constituted more than 90 percent of the total value of Bolivian exports, with tin accounting for about 70 percent. Bolivia also produces tungsten, gold, silver, copper, bismuth, lead, antimony, zinc, and petroleum.

Agriculture has not been well developed in Bolivia. About 5 million acres are estimated to be under cultivation. Productivity of the land is low and modern agriculture machinery and methods are not used. Most crops raised in the country are grown for the domestic market, but some dried fruits, coffee, rubber, cinchona, cacao, and nuts are exported, as are some cattle and cattle products.

Lack of cheap power and coal has limited development of industry in Bolivia. What little manufacturing there is, is centered in the Department of La Paz. Industries include processing of foodstuffs and beverages, textiles, furniture, tobacco, glassware, and chemical products.

Foreign Trade. Bolivian exports usually exceed imports. Since Bolivia has no seacoast, all foreign trade is conducted through Argentina, Chile, or Peru, which grant special privileges to Bolivian commodities. In 1942, exports totaled 227,104,000 bolivianos, of which the value of tin amounted to 163,907,000 bolivianos; of other minerals, 54,195,000 bolivianos (about 96 percent of all exports). In that year the United States received 65.7 percent of the total exports; the United Kingdom, 31.9 percent; Argentina, 2 percent.

Bolivian imports consist chiefly of manufactured products. In 1942, imports totaled 124,883,000 bolivianos. Manufactured articles represented over one-half of the total; foodstuffs and beverages about 28 percent; raw materials some 15 percent. Of total imports for that year the United States provided 39.9 percent; Argentina, 26.8 percent; Peru, 14.9 percent; Chile and the United Kingdom each supplied about 6 percent.

HARRY B. MURKLAND.

BONIN ISLANDS (*Ogasawara Gunto*). An archipelago of 27 islands in the western Pacific, about 550 miles south of Tokyo, Japan. The chief islands are Chichi (10 sq. mi.), Haha, Ani, Ototo, Mei, Yome, Muko, and Nakadachi. Total area: 30 square miles. Population: 6,000 in 1940. Capital: Omura (on Chichi). The principal agricultural crops are sugarcane, pineapples, and bananas. The Bonins passed to the control of United States forces following the surrender of Japan to the Allied nations in 1945.

BOWLING. America's popular winter sport celebrated its fiftieth anniversary last year and its tremendous growth since 1895, when it became an organized and well-governed game, is shown by the legion of 20,000,000 followers that it has today. The lifting of travel restrictions came as a birthday present to the American Bowling Congress, but a little too late to permit renewal of major championships.

However, all the big events of the prewar era are on the 1946 schedule.

With national tourneys curtailed, individual play again was overshadowed by the great contribution of the Bowlers Victory Legion to the war effort and the peace effort. The league raised more than \$300,000 to provide recreational kits for service men, drawing from Gen. Dwight D. Eisenhower a letter of thanks that commended the nation's bowlers for "helping to make the life of overseas men more pleasant." League members also played important roles in War Bond sales and various charity fund drives.

Among the stars of the year in individual play were Joe Wilman of Chicago, winner of the match-play crown; Buddy Bomar of Chicago and Andy Varipapa, New Yorker. William Kenet and Walter Rappenhagen of Detroit led in doubles and Mrs. Marion Gorman, another Detroit, ranked among the best women competitors. Eckhardt and Becker Beers of Detroit came out on top in major team bowling.

THOMAS V. HANEY.

BOXING. With the majority of champions and other leading performers in the armed forces our boxing promoters once again depended on quantity rather than quality to maintain their financial resources. There was no dearth of boxing shows and the talent displayed evidently pleased the fans for they kept coming back for more. Mike Jacobs, named "Promoter of the Year," kept Madison Square Garden's turnstiles clicking with 42 shows that drew receipts of \$2,214,968, the Rocky Graziano-Freddie Cochrane, Tami Mauriello-Lee Oma and Graziano-Harold Green bouts each going over the \$100,000 mark.

Championship bouts were rare, most of the titles having been frozen during the war years. Willie Pep, the little Hartford, Conn., battler, was the only universally recognized champion to enter the ring in defense of his crown and he gave a great exhibition in defeating Phil Terranova of the Bronx in their featherweight meeting at the Garden. Pep, who served a hitch in the Navy, was released and then drafted for the Army, won recognition as the "Fighter of the Year." The Nutmeg Kid took part in seven battles in all, winning six and drawing in one to add luster to a brilliant record that at this writing showed 90 triumphs in 92 engagements.

More than 400 boxers returned from the wars before the close of 1945 and titleholders lost little time getting into training for the defense of laurels that no longer are frozen. Biggest ring news of the year was the return of the heavyweight king, Joe Louis, and his arch rival, Billy Conn, and Matchmaker Jacobs quickly signed the two for a title bout in June.

In addition to Louis and Pep, the champions include Jackie Patterson, Scotland, flyweight; Manuel Ortiz, El Centro, Calif., bantamweight; Bob Montgomery, Philadelphia (recognized by New York Commission) and Ike Williams (recognized by N.B.A.) lightweights; Freddie Cochrane, Elizabeth, N.J., welterweight; Tony Zale, Gary, Ind., middleweight, and Gus Lesnevich, Cliffside Park, N.J., light heavyweight.

Col. Eddie Egan, former amateur heavyweight king and Rhodes scholar, succeeded the late Gen. John J. Phelan as chairman of the New York Commission and introduced a new point system to supplement the old method of scoring on rounds. Under Egan's plan there were no draw decisions in main events in New York and virtually no disputed verdicts. The new plan has merit.

The end of the war saw boxing begin to boom in other lands. Bruce Woodcock, 24-year-old railway worker, won the British and Empire heavyweight honors by knocking out Jack London, who announced his retirement from the ring soon after that setback. Patterson, the world flyweight ruler, added the British Empire bantamweight crown to his trophies when he outpointed Jim Brady at Glasgow. Herb Narvo kept his heavyweight championship of Australia, Jimmy Webster won the South African bantam crown, Ken Shaw retained his Scottish heavyweight diadem and Nikolao Korolev continued to rule the Soviet heavies.

Amateur glove swingers had another busy year in this country and a pair of Indian boxers on Oklahoma City's five-man team stole the show at our national A.A.U. bouts, Amos Altson taking the bantam title and Virgil Franklin starring in the featherweight ranks. Other A.A.U. victors were Keith Hamilton, New Orleans, 112 pounds; Jetson Arnold, Philadelphia, 135 pounds; Abe Lee, Chicago, 147 pounds; Allan Faulkner, Buffalo, 160 pounds; Richard Nutt, Alexandria, Va., 175 pounds and Charles Lester, Cleveland, heavyweight.

The Coast Guard Academy, with five of its men taking individual honors, won team laurels in the Eastern Intercollegiate championships. Peter Thistle, 120; Brian O'Hara, 127; Allen Pearce, 135; J. L. Wright, 175, and George Richardson, heavyweight, triumphed for the Sailors. Army's fighters took the other titles, Stephen Connor, 145; Amos Jordan, 155, and John Castle, 165, scoring for the West Pointers.

THOMAS V. HANEY.

BRAZIL. A republic of South America. Area: 3,286,170 square miles. Population: 44,460,000. Capital: Rio de Janeiro.

Brazil is the largest country in South America and the fourth largest in the world. Over half of its total surface is composed of a plateau of 1,000 to 3,000 feet elevation. More than two-fifths of the country consists of the Amazon and part of the Plata lowlands. The lowlands and eastern coastal plain are tropical; most of the plateau region is sub-tropical; the southeast is temperate in climate.

Government. Brazil is a federal union of 20 states and five border territories. Getulio Dornelles Vargas became President by a coup d'état in October 1930. In 1937 Vargas dissolved the Congress and assumed direct control of the government. A new Constitution was drawn up in 1937 which was never made effective. Under a decree issued in 1939, the national government assumed virtually complete control over state governments. President Vargas resigned in October, 1945. Supreme Court Chief Justice José Linhares became acting chief executive pending elections, which were held on Dec. 2.

The People. Nearly one-half of the total population of South America lives in Brazil. It is estimated that about 60 percent of the people are of European origin (chiefly Portuguese, Italian and German); 30 percent are of mixed blood (white, Negro, and Indian); 8 percent are Negro, and 2 percent Indian. The foreign population consists mostly of Italians, Portuguese, Spanish, Germans, and Japanese, and is largely concentrated in the south and southeastern sections of the country. The number of persons per square mile ranges from 0.7 in the state of Amazonas to 114 in the state of Rio de Janeiro.

The three largest cities are: Rio de Janeiro, 1,780,000; São Paulo, 1,315,000; and Recife, 850,000.

The official language of Brazil is Portuguese, but

Italian and German are spoken in some sections of the southern states.

The predominant religion is Roman Catholic.

It was estimated in 1942 that about 50 percent of the adult population is literate. In 1941 there were 42,794 primary schools with a total enrollment of 3,350,737 students; 4,572 secondary schools with a total student body of 419,674; 4 universities and 57 separate faculties and institutes with a total registration of 21,098 students.

National Economy. Agriculture constitutes the basis of Brazilian economy. It is estimated that over three-fourths of the total population derives its income directly from agriculture. Livestock and livestock products rank first in domestic importance, while coffee and cotton lead all other agricultural crops in foreign trade.

Brazil now ranks fourth among cattle-raising nations of the world with some 42,000,000 head. In 1940 there were over 6,000,000 goats; more than 25,000,000 swine; and about 15,000,000 sheep. Livestock slaughtered in 1943 totaled 11,397,000 head; cattle and hogs accounting for more than 9,114,000. Meat, hides, and skins are the chief animal products. Hides, skins, frozen and preserved meat are exported.

The most valuable agricultural crops are coffee, cotton, and corn. The country produces about one-half of the world's output of coffee; ranks third among world producers of corn; and leads the countries of the Western Hemisphere in production of rice. Other important agricultural crops include: sugar, manioc, beans, citrus fruits, bananas and other fruits, tobacco, wheat, oil-bearing seeds and nuts, and cacao. Intensive efforts are being made to increase the country's output of rubber. Brazil produced 9,400,000 bags (of 60 kilograms) of coffee in 1944; 470,000 metric tons of cotton in 1943-44; 1,790,000 metric tons of rice in 1944; 1,300,000 metric tons of sugar in 1943-44; 1,998,887 bags (of 60 kilograms) of cacao in 1943; and 76,762,473 bunches of bananas in 1942. For the past 10 years Brazil's annual corn crop has averaged about 5,500,000 metric tons. Important forest products are also produced.

Brazilian industry has been developing rapidly since 1900. In 1940 Brazil had 52,379 manufacturing plants; by 1943 the number had grown to 100,000, employing 1,500,000 workers; São Paulo is the leading industrial state. In 1943 the most important manufactures were: foodstuffs, comprising about 32 percent; textiles, 19.8 percent; clothing and toilet goods, 7 percent; chemicals, 6.7 percent. It is estimated that the total value of Brazilian industrial production reached more than 31,000,000,000 cruzeiros in 1943. Sericulture, with an annual production in 1944 of 300,000 kilograms of silk yarn, representing a gain of nearly 400 percent in four years' time, is a growing industry.

With gradual development of Brazil's iron and coal deposits, her heavy industry is increasing. In 1944 the volume of pig iron produced was four times the output of the previous year; production of steel and sheet metal trebled in volume in the same period. Plans for a large scale steel industry were begun in 1941 with the start of construction of the \$75,000,000 Volta Redonda plant, with an estimated annual capacity of 350,000 tons of steel ingots, or 250,000 tons of finished products.

Foreign Trade. Brazil's foreign trade reached a high record in 1944. Exports totaled 10,711,338,000 cruzeiros, 80 percent of which was agricultural, livestock, and forest products. The largest single export item was coffee beans, valued at 3,879,349,000 cruzeiros. Cotton piece goods valued

at 1,046,193,000 cruzeiros ranked second, and raw cotton valued at 667,941,000 cruzeiros, third. Rubber exports in 1944 totaled 365,389,000 cruzeiros, an increase of 135 percent over 1943, though exports of tires and tubes decreased. During 1944 marked increases in exports were achieved for: pine, oiticica oil, sugar, rice, fruits, maté, corn, and tobacco; exports of cocoa dropped slightly in value but the value of cocoa butter exports more than tripled. During 1944 Brazil exported 107,640 tons of raw cotton; 13,555,484 bags of coffee; 25,805 tons of preserved beef; 15,860 tons of other preserved meats; 24,253 tons of hides and skins; 296,000 metric tons of pine; 110,146 metric tons of cacao beans and cocoa butter; and 48,692 metric tons of maté.

The total value of Brazilian imports for 1944 amounted to 7,885,836,000 cruzeiros, an increase of 29 percent over 1943. Foodstuffs, valued at 1,687,835,000 cruzeiros, made up the largest group of imports, of which wheat was the leading item. Manufactured iron and steel products, valued at 551,697,000 cruzeiros, ranked second. Imports of scientific instruments and accessories increased over 69 percent; imports of cutlery, tools, and utensils more than trebled. Newspaper and paper imports showed an increase of 217 percent over 1943, and imports of pharmaceutical products more than doubled. Notable increases were made in importation of electrical apparatus and of automobiles and accessories.

Ninety-three percent of Brazil's total imports in 1944 came from the American republics, which took 76 percent of Brazil's exports. The United States took 53 percent of Brazilian exports, and provided 61 percent of its imports. Argentina was the principal South American customer, taking 13 percent of Brazil's exports and furnishing 21 percent of its total imports. England, Spain, and Sweden were the chief European markets for Brazilian exports.

Events, 1945. There was an air of expectancy over Brazil as the year opened. President Getulio Vargas's most recent promise "to consult public opinion," made in a New Year's Eve speech, stirred up more talk of politics and elections than the country had heard in a long time. Newspaper editorials discussed election procedure and carefully worded literature about the long-banned political parties was circulated through the mails. The people of Rio de Janeiro speculated widely as to the date of their first elections since 1934.

On February 22 the Rio newspaper, *Correio da Manhã*, published the first open attack on the Vargas administration in years. Major Amílcar Dutra, director of the Department of Press and Propaganda (DIP), the government censorship agency, acted to suppress the paper, but a group of important publishers threatened to close their papers voluntarily if this was done. The Inter-American Conference on Problems of War and Peace was just beginning in Mexico City, and the Government dared not engage in open war with the press at that time. The result was complete collapse of press censorship in Rio and São Paulo; journalists complained, however, that it remained in effect for some time in other parts of the country.

The end of censorship marked the beginning of free political activity. On the last day of February Vargas granted the Cabinet's request that he call a general election for President and Congress, and on March 7 crowds gathered in Rio for the first political meeting since 1937; they heard students and opposition leaders attack the Government. At

a rally in downtown Rio on March 23, sponsored by student groups and the National Defense League to honor the Brazilian Expeditionary Force, Communism was openly espoused for the first time in years.

Two presidential candidates came immediately to the fore. War Minister General Enrico Gaspar Dutra was the choice of Administration forces, while Air Brigadier General Eduardo Gomes was supported by opposition groups. Political leaders from every state met in Rio early in April to organize the National Democratic Union behind Gomes, while on May 9 Dutra backers announced the establishment of the Social Democratic party. There was small difference between the platforms of the two parties. Both were democratic and liberal-conservative in attitude, and inclined to express themselves in vague generalities. The real issue was between the friends and enemies of Vargas.

Vargas himself was a political enigma. He stated several times that he was not a candidate, but his denials never seemed categorical. His most important statement of purpose was made in a speech in Vasco da Gama Stadium in Rio on May Day, when he told 60,000 workers that his "mission" was completed and he was ready to retire to private life. He enumerated the social gains achieved during his administration, stating: "I have lifted the nation and the workers' conditions to levels unheard of before." He endorsed the candidacy of Dutra, whom he said "merits the confidence of the nation." The President then announced that he would remain in office during the forthcoming election and would turn his office over to a successor "legally chosen by the people." But he finished with the promise that if the workers ever needed him in the future, "you may count on me."

At the same time Vargas was carrying out a series of liberal measures which his opponents labeled as political in motive. On April 5 Rio's police chief, João Alberto Lins de Barros authorized the reopening of the anti-Axis Society of the Friends of America whose closing the year before had led to the resignation of Foreign Minister Oswaldo Aranha. On April 22 Aranha assumed the presidency of the society, to which he had been elected but had been unable to accept because of its closing.

On April 11 a special court granted writs of habeas corpus to a group of prominent exiles, authorizing their return to Brazil: Octavio Mangabeira, former Foreign Minister in exile in New York; Paul Nogueira in Buenos Aires; and Armando Salles de Oliveira, a prominent political leader who had already returned to São Paulo. (Salles de Oliveira died on May 19.)

On April 18 Vargas decreed amnesty for all political prisoners. Most prominent of these was Luis Carlos Prestes, communist leader who had been in prison for nine years. Before his release Prestes had congratulated Vargas on Brazilian recognition of the Soviet Union, which had taken place on April 2, and some newspapers charged that a Vargas-Prestes alliance was in the making.

A proposed electoral law was published in the *Diário Oficial* on May 1 for comment and criticism, and on May 28 Vargas issued a decree-law setting congressional and presidential elections for December 2. Elections of state executives and legislatures would follow on May 6, 1948. The head of state and cabinet members must resign within 90 days before election if they were candidates for office. The code provided for obligatory voting for all adult males except soldiers and flatterers, and

for employed women, forbade the use of party uniforms and civilian militia, and provided a minimum of 1,000 votes for registration of new parties.

On May 25 Vargas decreed abolition of DIP (Department of Press and Propaganda), censorship agency since 1940 for press, radio, cinema and theater; and establishment of a National Department of Information under the Ministry of Justice.

In another controversial move, made on June 22, Vargas created an Administrative Commission for Economic Defense with wide enforcement powers over all businesses, both domestic and foreign. The order included the right to warn, then to intervene or expropriate any firm which the new body, headed by Justice Minister Aagemmon Magalhães, considered guilty of "acts against the national economy or contrary to the public interest." Vargas's opponents, who had been ceaselessly attacking the Government's wide control of the nation's economy, and accompanying rising prices, at once labeled the decree a political weapon which would give the President life and death power over their businesses. So wide-spread was the opposition, both in Brazil and in foreign countries, that on June 28 Magalhães announced postponement of effectiveness of the decree to August 1 so that commercial groups might study it further. The decree became effective on that date without important amendment, but Magalhães stated that it would take 30 days more to implement it, and that during that period there would be no official intervention in any business enterprise. Actually, the decree was never enforced and in November Provisional President Linhares repealed it.

There was an interesting development during the summer in the field of religion. Early in July the Catholic clergy were notified that Monsignor Carlos Duarte, Bishop of Maura, had been excommunicated because of "doctrinal errors." Duarte immediately announced the formation of a Brazilian Catholic Church free from Vatican ties, and assumed the title of Bishop of Rio de Janeiro. For years Duarte had openly criticized some aspects of Vatican policy and had objected to what he called "Fascist infiltration of the clergy." The new church was formally established on July 16. It would permit divorce, hold masses in Portuguese, and allow its clergy to marry. The clergy would be ordained by Duarte. Duarte also founded a political party, called the Christian Social Party, which on August 7 nominated Stelio Galvão Bueno, prominent Rio criminal lawyer, for President. "The principles of the Communists are also ours," Duarte stated.

The campaign continued through the summer, with Gomes and Dutra still the main candidates. Vargas's intentions remained unclear. He did not resign before September 2, as required by the electoral code, so he could not legally be a candidate. But organized groups of his followers, called *Queremistas* because of their slogan, *Queremos Getúlio*, continued to demand that he run, and Communist leader Prestes showed every sign of preferring Vargas to either of the other two aspirants. Tension was further increased when Prestes, later supported by the *Queremistas*, suggested that elections be held for a constituent assembly instead of for President, and that Vargas continue in office until a new constitution could be prepared.

United States Ambassador Adolf A. Berle Jr. took a hand in the campaign, implying the United States preferred the original plan to the constituent assembly proposal. The opposition applauded Berle but the Vargas forces cried "intervention."

On October 10 Vargas suddenly changed the rules by decreeing that state governors and legislatures be elected at the same time as the President and Congress. He also ordered state interventors to file copies of state constitutions (which did not then exist) within 20 days and to resign their posts 30 days before the election if they wished to be candidates. The opposition charged that this would permit the Vargas-appointed interventors to rig constitutions so as to permit their own elections as governors.

By the end of October, a crisis was obviously at hand. The possibilities of coup d'état, revolution, and counterrevolution were discussed freely in the newspapers and wherever Brazilians gathered. War Minister General Pedro Aurelio de Góes Monteiro made things worse rather than better by proclaiming, three times within four days, that elections would be held as scheduled on December 2.

The crisis passed from rumor to fact on October 27, when isolated street fighting broke out between supporters of Vargas and followers of Gomes. Police described the situation as completely calm on the night of October 28. Then, on the next day, Benjamin Vargas, the President's brother and one of the most hated men in Brazil, was made chief of police of Rio de Janeiro.

That evening the government radio station suddenly went off the air with no other explanation than that it had been ordered to suspend operations. A little while later, tanks, assault cars and jeeps moved swiftly through the city to take dominating positions at key points. And early in the morning of October 30 Góes Monteiro announced that Vargas would hand over the Government to Chief Justice José Linhares of the Supreme Court.

"It has not been a coup d'état, but a spontaneous and natural reaction with the support of all armed forces," Linhares declared as he took over the presidency.

The armed forces had, indeed, been the key to the situation. A large part of the army insisted that a new president be elected in December. Vargas had promised this. But his opponent feared he would use some last-minute excuse to stay in power. As the argument grew more heated, the situation became more chaotic and hence riper for a Vargas coup. The appointment of his unpopular brother Benjamin to the important Rio police post might have been the beginning of just such a coup. The army therefore moved against Vargas as a unit, and he stepped out.

Brazil took revolution in its stride. Tanks and machine guns remained at strategic points in the capital for a day or so, then disappeared. The December 2 elections were reaffirmed. A new Cabinet, including men who had remained aloof from politics during Vargas's 15-year rule, took office under Linhares, and on October 31 Vargas left for his São Borja ranch in southern Brazil.

The new Government clearly regarded itself as a stop-gap and functioned as such, devoting itself primarily to preparations for the election. Exhilarated by the prospect of a really free vote, Brazilians turned out enthusiastically and in large numbers; 7,000,000 registered for the December 2 poll.

The vote was free and orderly and, contrary to most forecasts, Dutra was an easy winner over his three opponents. (Near the end of the campaign the Communists nominated a non-Communist highway engineer named Yeddo Fiuza.) Vargas's influence was clearly apparent in the Dutra victory, and the former dictator himself was elected to Congress from his home state.

Foreign Relations. The Brazilian Foreign Ministry devoted most of its attention during 1945 to building up the country's war-won position as the second power in the hemisphere. Recognition of the Soviet Union was a step in this direction, as had been the despatch of the Brazilian Expeditionary Force to Italy. Joyous crowds estimated at more than 700,000 persons watched the home-coming parade of a 5,300-man contingent of the BEF on July 18. The day was declared a national holiday, and the troops were welcomed by Vargas and his guest of honor, U. S. General Mark Clark; a contingent of United States mountain troops took part in the parade.

Brazil declared war on Japan on June 6.

Continued close cooperation between Brazil and the United States was also marked during the year. United States Admiral Jonas H. Ingram, commander of the Atlantic Fleet, announced in July that "with the exception of the small staff of the naval operating base at Rio, the United States no longer operates at any base in Brazil." Admiral William Monroe, commander of the South Atlantic Squadron shortly afterward completed the formalities of handing over installations and left Brazil; thereafter that country had full responsibility for patrolling the South Atlantic. Monroe promised that "the United States after the war will do much for the Brazilian Navy."

Brazil was the only Latin American nation selected to participate in the conference of 21 nations which would consider peace treaties.

HARRY B. MURKLAND.

BRETHREN, German Baptist (Dunkers or Dunkards). A religious organization founded in Schwarzenau, Germany, in 1708 by a group of Pietists and established in Germantown, Pa., in 1719 under the leadership of Peter Becker. There are four denominations of Brethren in the United States, the largest and oldest group being the Church of the Brethren, or Conservative Dunkers, with headquarters at Elgin, Ill. See RELIGIOUS ORGANIZATIONS.

BRIDGES. War restrictions affecting bridge work were largely relaxed in 1945, but too late to begin construction on important projects. It is estimated that the early postwar period will require \$800,000,000 for highway bridges and \$250,000,000 for municipal bridges. Research has included experiments to determine the stresses in steel bridges under steam and electric locomotives at various speeds. Increasing projects for grade separation have led to study of the relative merits and economics of different types of highway bridges.

Studies of wind effects on bridges, due to the destruction of the Tacoma suspension bridge and the Chester truss bridge, have led to new designs for a 2,800-ft. suspension bridge at Tacoma, Wash. Measures have been taken also to reduce vertical oscillations in existing suspension bridges, and the 2,300-ft. span at Whitestone, N. Y., is to have the depth of its stiffening trusses increased from 11 ft. to 25 ft. Reports on wind forces as affecting bridges, by D. B. Steinman, have been published in the "Proceedings" of the American Society of Civil Engineers. The curious arrangement of suspension cables devised by Mr. Steinman for the "Skyride," aerial tramway at the Chicago World's Exhibition of 1932, is being developed for suspension bridges, including a type of military bridge.

An extraordinary and unprecedented structure is a concrete floating bridge in the form of a horizontal arch, lying on the water, for the crossing of

the Derwent River at Hobart, Tasmania. It is composed of 24 reinforced-concrete barges or pontoons arranged as an arch and connected rigidly by welding the steel reinforcing bars together; at the crown, or upstream point, is a 25th keystone pontoon. The length along the curve is 3,165 ft., and beside the roadway there is a walk and a water main. A concrete bridge over the Chattahoochee River, near Atlanta, Ga., has girders 220 ft. long, continuous over three spans of 65, 90, and 65 ft. A concrete arch bridge of 266 ft. span over the Crooked River, Oregon, carries the aqueduct of the Deschutes irrigation project. It is in the form of a truncated triangle, with two legs inclined at 45 degrees carrying the horizontal member, which is the conduit and extends beyond its supports to the sides of the canyon.

A contract for the foundations of the new Mississippi bridge at Memphis, Tenn., was awarded in July, but bids for the spans were later rejected as too high. This project is financed by Tennessee, Arkansas, and the city of Memphis. The project for a bridge over this river at Helena, Ark., has been extended again by Congress for one more year. A third project for the Mississippi is a high-level bridge at New Orleans, starting near the center of the city. It is to be of the cantilever type, with a main span of 3,000 ft. and two anchor-arm spans of 600 ft. Deep foundations will be required in the soft alluvial soil. It will carry two 24-ft. separated roadways, and provide for future construction of two similar roadways outside of the trusses.

A trend towards timber bridge construction was halted by military demands on the mills, but some log bridges of 40 to 65 ft. span were built to replace old and weak timber-truss structures. A timber highway bridge near Carlsbad, New Mexico, over the Pecos River, consists of 15 spans of 50 ft. on concrete piers. Each span has four shallow trusses covered by a floor of laminated timber, with a bituminous wearing surface.

A new railway line into Kansas City, opened in June, crosses the Missouri by a bridge having a 420-ft. vertical-lift span, three truss spans of 250 ft., and several girder spans. It is 2,625 ft. long, and was built jointly by the Milwaukee and Rock Island railroads. The Santa Fe Railroad completed a bridge across the Colorado River at Topock, Arizona. It is 1,507 ft. long, with three truss spans of 350 ft. and girder spans of 50 to 100 ft. The Southern Pacific Railroad replaced its noted but outgrown Pecos River bridge by a new cantilever bridge 440 ft. upstream. The old bridge, 300 ft. above water, was carried by tall steel piers, but the new one has concrete piers 275 ft. high, designed to withstand earthquake shocks.

A serious fire occurred in April in the floor of the 12½-mile bridge between San Francisco and Oakland. Owing to the great length of the bridge, there is a fire station on Yerba Buena Island, at the middle, with mains and hydrants along the roadway. Fires average five per month, but in addition there are about 14 false alarms and calls to stand by at automobile accidents. The traffic has grown so largely that plans for a second bridge are being considered. The Golden Gate suspension bridge at San Francisco may be taken over by the State, as the Bridge District is unable to meet the costs of operation and maintenance.

A twin double-leaf bascule bridge designed to carry the Congress Street extension across the Chicago River is to be of 170 ft. span, each part to have a 43-ft. road and 6-ft. walk. The State St. bascule bridge across this river is still in the future.

At Boston, a double-leaf bascule bridge of 225 ft. over the Chelsea River will give a 175 ft. channel and improved communication with South Boston. Pontoon bridges continue to be developed for civil and military use. The U. S. Navy Station at Long Beach, Calif., has a pontoon draw-span in which the two concrete pontoons, approached by hinged ramps, are drawn back under the approaches.

The U. S. Government has agreed to pay \$2,382,000 to the Gandy Bridge Co. for its embankment or causeway, with bascule bridge, across Tampa Bay, Florida. In 1944 the company refused to sell, and the Government seized it as an aid to war work. A similar work is proposed by the city of St. Petersburg, Florida. The so-called causeway across Lavaca Bay, Texas, which was opened in 1944, is a pile trestle 10,300 ft. long, with 20-ft. spans and a 50-ft. bascule drawbridge. A causeway is proposed by the Canadian Government to connect Cape Breton Island with Nova Scotia, replacing a car ferry service. It would carry a road and a railway line. In the Orkney Islands, north of Scotland, a causeway or embankment was built between islands along the Scapa Flow naval anchorage to prevent access by submarines. It is composed of rock-filled wire cages and concrete blocks of 5 to 10 tons. No bridge is required, as the normal entrance to Scapa Flow remains open.

Toll bridges come and go, as new projects propose tolls to repay the cost, while tolls on many bridges are cancelled. In South Carolina, the Cooper River bridge at Charleston is to be freed, the State Highway Department assuming the bond issue of \$4,150,000. California has freed the big Carquinez and Antioch bridges. Tolls were stopped on eight bridges in Kentucky, leaving only four State bridges and a few private structures.

Alterations to bridges include interesting operations. A bridge of three 306-ft. truss spans of the Illinois Central R.R., crossing the Tennessee River, was abandoned as its site would be submerged in the reservoir at the new Kentucky Dam. The spans were moved upstream 62 miles on barges and placed on new piers to carry the Nashville, Chattanooga & St. Louis R.R. To comply with flood control requirements, the Central Ave. bridge over the Kaw River at Kansas City is to be raised 10 ft. At Lewiston, Maine, an old bridge having seven 85-ft. spans was adapted to heavier loads by applying a stronger but much lighter floor. The "Long Bridge" of the Pennsylvania R.R., having 11 truss spans of 165 to 211 ft., and a swing span of 280 ft., was rebuilt with girder spans of half length supported by intermediate piers. Traffic was not interrupted. In raising a bridge over the Little Tarkio River, in Missouri, girder spans were lifted out by cranes and set back on the bank while the piers were built up to the new level. The one truss span was raised by jacks. At Cleveland, Ohio, removal of a river bridge, ordered by the War Department as an obstruction to navigation, was refused by the city on the ground that owing to the heavy traffic the new bridge should first be built. An old 320-foot California suspension bridge had its original timber towers replaced with steel.

Military, portable or sectional bridges have had wide application, and the members or sections have been built at numerous steel plants, large and small, throughout the country. Spans of the noted Bailey bridges were built across the Sabine and Neches Rivers, in Texas, by the Corps of Engineers, U. S. Army, to replace structures damaged by floods;

and in preparation for crossing the Rhine, engineer troops were trained by constructing pontoon bridges across the Columbia River. Of American design are the V-bridge, so called from the position of its trusses and an 80-ft. jack-knife bridge which folds up in two 40-ft. sections for transportation and can be handled by a truck-mounted crane.

The long-delayed bridge over the Uruguay river, between Uruguayana (Brazil) and Paso de los Libres (Argentina), is expected to be completed in December, 1945. It is 4,630 ft. long, carrying a road, railway, and sidewalk. In Bolivia, a bridge of the transporter or aerial tramway type has been built across the Espiritu Santo River. Tall steel towers carry track cables of 885 ft. span, on which rides a trolley operated by haulage cables. Suspended from the trolley is a car or platform 10 x 20 ft. At Montreal, Canada, repairs have been made to the stone piers of the Victoria Bridge, built in 1854 and slightly altered in 1890 when the original rectangular tubular spans were replaced with truss spans. At Ste. Rose, Quebec, welded, continuous girders, 1,550 ft. long, cover 14 spans of 90 to 126 ft. A St. Lawrence River highway bridge at Quebec, proposed by the provincial government, is to be two miles below the present bridge which serves both highway and railway traffic but is some distance above the city.

Extraordinarily complicated and rapid work has been done by the American and English forces in Europe to replace hundreds of railway and road bridges demolished during the war. This work, combining hard work, ingenuity, and speed, enabled the Allied forces to follow closely on the heels of the retreating Germans, and was continued after the surrender for handling supplies and restoring communications. Some 200 wrecked bridges had to be removed from the Albert Canal, in Belgium, to reopen navigation. About 400 railway bridges in Belgium were repaired or replaced. Although none of the noted Seine bridges of Paris were demolished, the French face great numbers of bridge renewals on the Seine and Marne. The noted Plougastel bridge, near Brest, with three concrete arches of 612 ft. span, had one of the spans broken. It is a double-deck structure, carrying a railroad and a highway. The U. S. troops built 14 bridges across the Rhine. Wreckage of Danube River bridges at Budapest had to be cleared away to prevent ice jams and flooding of the city. On the Burma war front, a 1,200-ft. pontoon bridge was built to carry the Ledo Road across the Irrawaddy; also a Bailey suspension bridge to carry the Stillwell Road across the Shweli River. (See Foundations.)

E. E. RUSSELL TRATMAN.

BRITISH CENTRAL AFRICA. An area of 478,027 sq. mi. lying between the Union of South Africa on the south, Mozambique on the east, Angola on the west, and the Belgian Congo and Tanganyika Territory on the north. It consists of Southern Rhodesia (150,333 sq. mi.), Northern Rhodesia (290,320 sq. mi.) and the Nyasaland Protectorate (37,374 sq. mi.).

Government. The administration of each of these three territories is separate, though the movement for their "amalgamation" has picked up momentum in recent years.

Southern Rhodesia is a self-governing colony with an elective one-chamber Legislative Assembly of 30 members to which the Cabinet (nine Ministries) is responsible. The franchise belongs to all British subjects with certain exceptions. The

natives, who constitute over 90 per cent of the population, are excluded from political life. The constitutional status of Southern Rhodesia is somewhere between that of a crown colony or a dominion. It is supervised by the Dominions rather than the Colonial Office. In 1937 a law provided for the establishment of native councils, representing local chiefs and notables, but with purely advisory functions. The capital is Salisbury.

Northern Rhodesia is a crown colony, in which the Governor is responsible to the Colonial Office in London. The Legislative Council now has an unofficial majority including a European nominated to represent the interests of the African population. The capital is Lusaka.

The Nyasaland Protectorate (formerly British Central Africa) is governed as a crown colony under the supervision of the Colonial Office. The Governor is assisted by Executive and Legislative Councils, both nominated. African provincial councils, composed of native chiefs and other responsible Africans, have been set up in each of the provinces for purposes of consultation. Zomba is the capital.

Events, 1945. The aspirations of those who have been asking for the political amalgamation of British Central Africa were partially fulfilled when on April 24 there took place in Salisbury, Southern Rhodesia, the first meeting of the new Standing Central African Council. *Ex officio* members of this body are the Prime Minister of Southern Rhodesia and the Governors of Northern Rhodesia and Nyasaland. Each of these appoints three more members from their territories to serve two-year terms. The Chairman is the Governor of Southern Rhodesia, Sir Campbell Tait. At the April meeting Sir Campbell warned the members against assuming that the Council was necessarily a prelude to amalgamation, though he did not exclude this as an eventual possibility.

Business conditions for the year were on the whole favorable. In Southern Rhodesia the gold premium tax was repealed in order to encourage the mining of low-grade ore. Cattle sales held up and the breed of stock was rapidly improving. Tobacco production in Rhodesia and Nyasaland was good. Local producers were worried by reports that the American Government was trying to get Britain to reduce the imperial preference on their product. It is the favored position in the imperial market that makes this African tobacco culture profitable; with even more protection they could increase production several-fold. The Rhodesian Corporation reported in September that it held 1,347,000 acres, having sold 52,785 acres in 1944.

In Northern Rhodesia possibilities were explored for reducing the colony's reliance on copper production, which accounted for 60 per cent of its total income. But more emphasis on farming and stock-raising opened up the problem of land and of the native's status on it. On June 19 there was held the first meeting of the Legislative Council with its newly created unofficial majority. This majority proceeded to vote against official proposals and to demand even greater self-government—which the government was bound to resist until native interests were better protected. Early in the summer the Paramount Chief of the Barotse, Yeta III, abdicated after 29 years of unswerving loyalty to the British Crown.

In Nyasaland it was found desirable to divide the unwieldy Northern Province and form a Central Province. There were thus three Provinces in all, each with its own African Council consisting of 20 chiefs and five other responsible Africans. From

the Colonial Development and Welfare Fund Nyasaland was granted £345,000 in order to finance a five-year plan for developing the Protectorate's meager educational facilities. In addition the sum of £130,000 was transferred from the Native Tobacco Board and appropriated for the creation of a Development and Welfare Fund with which to improve conditions among the natives.

Characteristics of the Population. The population of Southern Rhodesia was (1941) 1,448,000, of which 68,954 were Europeans; Northern Rhodesia (1943) 1,385,386 (18,745 Europeans); Nyasaland (1940) 1,685,045 (1,738 Europeans).

A large proportion of the natives, or Bantu, still live under tribal organization, a notable example being the Barotse of Northern Rhodesia. Increasing numbers, however, work at least part of the year in mines or in some other industrial enterprise. Many of the natives of Nyasaland migrate to the mines of the Rhodesias and of the Union of South Africa. Missionary work is carried on among the Bantu and increasing attention is being paid to African education. Recent figures give the number of schools for natives as: 1,457 in Southern Rhodesia, 902 in Northern Rhodesia, and 4,070 in Nyasaland, with a total of 400,000 pupils. The governments help support many of the schools run by missionaries. Educational opportunities for the European population are much more extensive and modern.

The Economy of the Country. The natives engage almost exclusively in pastoral and agricultural pursuits. In the Rhodesias they have been confined largely to "reserves." In Southern Rhodesia these amount to only one-fifth of the land once occupied by them. The British South Africa Company still holds some four million acres of land here, plus immense tracts in Northern Rhodesia. A million and a half acres of the best land in Nyasaland have also been alienated by European owners who have established tea, cotton and tobacco plantations. Tobacco is also an important product in Southern Rhodesia.

Northern Rhodesia produces large amounts of copper (nearly 300,000 long tons in 1943), cobalt, vanadium and zinc. In Southern Rhodesia gold, chromite and other minerals are mined in significant quantities. Bauxite deposits have been found both here and in Nyasaland.

An idea of the volume of trade can be gained from the following figures: exports—Southern Rhodesia (1940) £13,399,357; Northern Rhodesia (1943) £18,946,080; Nyasaland (1943) £1,379,401. The Rhodesian railway system (controlled by the British South Africa Company) has a trunk line running from the Union of South Africa to the Belgian Congo, with several branch lines, including one to Beira in Portuguese East Africa. The latter port is also connected by rail with the Nyasaland Protectorate. Northern Rhodesia's outlet to the Atlantic is via the Benguela Railway to Lobito Bay in Angola. In general the highways are few and poor in quality, while the rivers are largely useless for transport purposes. Small boats ply on Lake Nyasa.

ROBERT CALE WOOLBERT.

BRITISH EAST AFRICA. Under this collective heading are included KENYA (224,960 sq. mi.), the UGANDA PROTECTORATE (93,981 sq. mi.), TANGANYIKA TERRITORY (360,000 sq. mi.) and ZANZIBAR (1,040 sq. mi.)—making a total of 679,981 sq. mi. All border on the Indian Ocean except Uganda, which lies at the headwaters of the White Nile.

Government. Each of the four regions is governed

separately and differently. For several years, however, the European element, especially in Kenya, has been proposing the creation of an East African Dominion comprising Kenya, Uganda and Tanganyika. This proposal of "closer union" has been opposed by the authorities in London, who maintain *inter alia* that the rights of the natives would suffer under such a scheme. Since 1936 the money of the East African Currency Board has circulated in all four regions. The three mainland territories formed a postal and telegraph union in 1933.

Kenya consists of two parts: the Protectorate and the Colony. The former is the ten-mile strip along the coast (with certain islands) leased from the Sultan of Zanzibar. The rest forms the Colony. The Governor administers both Colony and Protectorate with the aid of an Executive Council, and legislates with the advice and consent of a Legislative Council. The latter consists of the following elected members: 11 by Europeans, 5 by Indians and one by the Arabs. Two are nominated to represent the interest of the African community, 11 are *ex officio* official members, not more than nine are nominated officials, including one to represent Arab interests. The small white minority thus possesses a highly disproportionate representation. Any attempt by the British Government to increase the representation of the natives, Arabs, or Indians is resented by the Europeans, who maintain that Kenya must become a "white man's country." The capital is Nairobi.

Uganda has quite a different arrangement. The province of Buganda is treated as a Kingdom over which rules a Kabaka assisted by three native ministers and a Parliament (Lukiko). There is thus a wide measure of native self-government, or "indirect rule." The nature of this arrangement was officially described in the House of Commons on March 14, 1945, as follows:

"It is the function of the Lukiko, as the Buganda Council is called, to discuss all matters relating to African administration and to frame laws for the Baganda. Resolutions and proposed laws are forwarded to the Kabaka, who is required to consult with the Governor of Uganda before giving effect to them, and to follow his advice. New laws have also to be approved by the Secretary of State. Subject to the Governor's approval, the Kabaka may appoint three Ministers—a Prime Minister, Minister of Justice, and a Minister of Finance. The Chief of each county in Buganda—20 in all—is also an *ex-officio* member of the Lukiko. In addition the Kabaka nominates three notables from each county—60 members." The rest of the country is under direct administration, though even here local chiefs and councils are given considerable leeway. The capital is Entebbe.

Tanganyika is a Class B Mandate and thus subject to the rules laid down by the League of Nations safeguarding native rights, the open door, etc. The Governor is assisted by Executive and Legislative Councils, but neither is in any way a truly representative institution.

The Zanzibar Protectorate comprises Zanzibar, Pemba and adjacent islands. There is a reigning Sultan, but the administration is directed by the British Resident.

Events, 1945. The problem of how to reintegrate the askari—the returning soldier who had fought in the Middle East and in Burma—into his African environment claimed the attention of all the colonial governments. Having seen the world and having acquired a new self-confidence, it was feared by some of the Europeans that he would not wish to return to his old status, or, in Kenya,

accept the color bar and other discriminatory practices. Some of the Africans had also learned trades and now aspired to go into business for themselves, thus competing with the Indians.

Cold water was thrown on the proposals for creating a "closer union" of Kenya, Tanganyika and Uganda when Sir Philip Mitchell, Governor of Kenya, declared on November 6 that he did not believe any such scheme was practical politics. Nevertheless the governors of the three mainland areas continued to meet in periodic conferences to discuss matters of common interest.

In Kenya for the first time in 22 years the Governor, in March, allowed the official members of the Legislative Council to vote freely, with the result that with one exception they supported a motion critical of the government. During the summer a proposal for decentralizing the government was accepted "in principle" by the Legislative Council but was opposed by the Indians, Arabs, and natives as not according them sufficient representation.

In Uganda a general strike was declared on January 15. The following days saw rioting in which eight Africans were killed and several wounded. The somewhat obscure causes of the trouble seemed to be mainly political—to force the young Kabaka to effect certain changes in his government. In July a report by the Chief Justice of Uganda, who had been appointed to investigate the troubles, suggested reforms, such as the alteration of the Constitution to allow direct representation of other educated Africans besides chiefs, and to include peasant representation.

On September 5 the Katikro (Prime Minister) of Buganda, Martin Luther Nsibirwa, was assassinated outside Kampala Cathedral. Elements whose power would be diminished by the impending reforms were suspected of having plotted this deed, as well as a *coup d'état* that never came off. A number of men charged with complicity, including several chiefs, were held for deportation. Before the young Kabaka left for England on September 24 to enter Cambridge University, he appointed three regents to serve in his absence. Late in October the Colonial Office announced that it had approved the appointment of three African members to the Protectorate Legislative Council in Uganda, something new for that body.

Characteristics of the Population. Native Africans constitute the overwhelming majority of the population, as is evident from the following figures: Kenya (1943 estimates)—3,591,624 natives, 30,765 Europeans, 55,795 Asiatics (mostly Indians) and 17,640 Arabs; Uganda (1944 estimates)—3,901,440 natives, 26,537 Asiatics, 2,747 Europeans; Tanganyika (1943)—5,355,786 natives, 16,709 Europeans, 45,099 Asiatics; Zanzibar (1931)—ca. 250,000, including 300 Europeans, 14,000 Indians and 33,400 Arabs.

The situation of the natives varies considerably. In Kenya they have been compressed into restricted "reserves" while the European settler has taken much of the best land in the temperate highlands. Exponents of the natives' point of view insist the areas allotted them are inadequate to supply a livelihood, thus forcing many to work for the whites under adverse economic and social conditions. During the last ten years nearly one-half of the soil in the reserves is reported to have been lost through erosion. The "color bar" is enforced and constitutes an added grievance.

In Uganda native interests generally come first, for there is no attempt to make a "white man's country" out of it as in Kenya. The mandatory

regime in Tanganyika is obligated to protect the interest and institutions of the natives. In Uganda and Tanganyika detribalization has not proceeded as far as in Kenya. Zanzibar is essentially a commercial center, where the population is a mixture of Negro, Arab, Indian and other elements. The same is true of some of the coastal towns of the mainland. The natives of Tanganyika are fairly homogeneous, racially speaking, but in Uganda and Kenya there are important Hamitic, Nilotic and Sudanese elements in addition to the Bantu. Swahili, the *lingua franca* of East Africa, is spoken on the coast in the port towns. In the interior paganism prevails wherever the natives have not been converted to Christianity. Missionary activities provide for most of the educational opportunities open to the African population. Figures illustrating native education are: Kenya, 2,646 schools; Uganda, 73,000 pupils; Tanganyika, 54,000 pupils; Zanzibar, 15,000 pupils. There are a few secondary schools, and at Kampala (Uganda) is Makerere College where higher learning is obtainable. The educational needs of the white population are given special attention and financial support.

Economy of the Country. In an area so vast and with such varied topography and climate, native occupations likewise vary. However, as elsewhere in Africa, stock-raising and primitive agriculture predominate. Where the native has forsaken these pursuits it is usually because the European has enticed him away from, or driven him off, the land. The small European population supervises the governmental apparatus and the large-scale economic enterprises, while much of the retail business is in the hands of Indians.

The commercially important products are evident from each area's principal exports: Kenya and Uganda—coffee, sugar, tea, cotton, hides and skins; Tanganyika—sisal, cotton, coffee, hides and skins, grain and copra; Zanzibar—copra and cloves (of which Zanzibar is the world's principal source of supply). The mineral resources of British East Africa are not fully explored or exploited, but tin and gold are mined in significant quantities. The forest resources are also considerable. Industry has barely made a beginning, and hence the chief imports are manufactured articles.

Exports and imports (by value) were respectively as follows: Kenya and Uganda (1943)—£9,898,453 and £12,904,974; Tanganyika (1940)—£5,641,520 and £3,000,939; Zanzibar (1943)—£1,137,321 and £1,216,238. The chief seaports are Mombasa, Dar-es-Salaam and Zanzibar. From Mombasa a railway runs through Nairobi to Kampala in Uganda (879 miles), and from Dar-es-Salaam another stretches westward to Kigoma on Lake Tanganyika (774 miles). Altogether there are some 3,000 miles of railway in British East Africa. Steamers operate on Lakes Nyasa, Tanganyika, Victoria, Kioga and Albert, and on the Upper Nile.

ROBERT GALE WOOLBERT.

BRITISH EMPIRE. The world's largest empire, comprising an area of 13,319,248 square miles and a population of about 555,793,786. It consists of:

1. The United Kingdom of Great Britain and Northern Ireland. See GREAT BRITAIN; IRELAND, NORTHERN.

2. Self-governing Dominions—AUSTRALIA, CANADA, NEWFOUNDLAND (temporarily administered by a Governor and Commission, responsible to the Crown through the British Secretary for Dominion Affairs), NEW ZEALAND, UNION OF SOUTH AFRICA.

3. EIRE (IRELAND), a sovereign, independent state, associated for certain purposes with the United Kingdom and the self-governing dominions, which are sometimes referred to collectively as the British Commonwealth of Nations.

4. INDIA AND BURMA.

5. Self-governing colonies—CEYLON and SOUTHERN RHODESIA.

6. Crown colonies and protectorates—ADEN, BAHAMAS, BARBADOS, BASUTOLAND, BECHUANALAND, BERMUDA, BRITISH GUIANA, BRITISH HONDURAS, BRITISH SOLOMON ISLANDS, BRITISH SOMALILAND, CYPRUS, DOMINICA, FALKLAND ISLANDS, FIJI, GAMBIA, GILBERT AND ELLICE ISLANDS, GIBRALTAR, GOLD COAST, GRENADA, HONG KONG, JAMAICA, KENYA, LEEWARD ISLANDS, MALTA, MAURITIUS, NIGERIA, NORTHERN RHODESIA, NYASALAND, ST. HELENA, ST. LUCIA, ST. VINCENT, SEYCHELLES, SIERRA LEONE, STRAITS SETTLEMENTS, SWAZILAND, TRINIDAD AND TOBAGO, UGANDA, ZANZIBAR.

7. Protectorates of a special nature—BRITISH NORTH BORNEO, BRUNEI, FEDERATED MALAY STATES, SARAWAK, UNFEDERATED MALAY STATES—collectively known as BRITISH MALAYA. Also TONGA.

8. Mandates held by the United Kingdom—BRITISH CAMEROONS, PALESTINE, TANGANYIKA TERRITORY, TRANS-JORDAN, TOGOLAND (British sphere).

9. Mandates held by Dominions—NAURU (Australia), NEW GUINEA (Australia), SOUTH-WEST AFRICA (Union of South Africa), WESTERN SAMOA (New Zealand).

10. Dependencies of Dominions—LABRADOR (Newfoundland); ASHMORE AND CARTIER ISLANDS, PAPUA, NORFOLK ISLAND, AUSTRALIAN ANTARCTIC TERRITORY (Australia); TOKELAU or UNION ISLANDS and Ross Dependency (New Zealand).

11. Territories held under condominium—ANGLO-EGYPTIAN SUDAN (United Kingdom and Egypt), NEW HEBRIDES (United Kingdom and France), CANTON and ENDERBURY ISLANDS (United Kingdom and United States).

See the separate articles on GREAT BRITAIN; the self-governing Dominions; EIRE; IRELAND, NORTHERN; INDIA; and BURMA.

The Dominions. The essential position of the Dominions was defined by the Imperial Conference of 1926 as follows: they are autonomous communities within the British Empire, equal in status, in no way subordinate one to another in any aspect of their domestic or external affairs, though united by a common allegiance to the Crown, and freely associated as members of the British Commonwealth of Nations. After technical changes were made the meaning of this declaration was incorporated in the Statute of Westminster, 1931, an act passed by the British Parliament.

In external relations the Dominions are in the same position as independent states, but they may if they desire make use of British diplomatic machinery. Practice in this respect varies. In regard to defense the autonomy of the Dominions is complete. In judicial matters the right to appeal from the final decision of the Dominion courts to the Privy Council rests on a Crown prerogative which has been in operation since the earliest days of colonial government. Here also practice varies, and it is clear that the appeal is retained only in so far as the Dominions desire. The immediate link between the British Crown and the Dominions is the Governor-General, but the interests of the respective territories are represented by High Commissioners sent to the Dominions by the United Kingdom and to the United Kingdom by the Dominions.

Events, 1945. A characteristic British Commonwealth meeting was held in London in April when Dominion and Indian representatives met for talks preliminary to the conference at San Francisco on the future world organization. The delegation leaders were as follows: Canada, Vincent Massey, High Commissioner in London; Australia, F. M. Forde, Deputy Prime Minister; New Zealand, Peter Fraser, Prime Minister; South Africa, Field Marshal Jan Smuts, Prime Minister; India, Sir Ramaswami Mudaliar, Supply Member of the Viceroy's Executive Council. At the close of the conference the Dominions Office issued a statement, approved by the delegates, endorsing the formation of a United Nations Organization and promising that each of the countries assembled in London would be represented at San Francisco.

Other conferences on matters of concern to the members of the Commonwealth were held in London in the course of the year. The rough outlines of a plan for pooling news and entertainment programs, staff and technical information on the United Kingdom, the Dominions and India was drafted at a Commonwealth broadcasting conference in March. An Empire wool conference in April and May resulted in a report and recommendations from the United Kingdom and all of the Dominions except Canada (which is less directly concerned with raw wool supplies), agreeing on a joint organization for the marketing of wool. The first full meeting of the British Commonwealth Air Transport Council in July drew representatives from all parts of the Empire. Most of the delegates remained in London for the plenary session of the International Committee on Air Navigation in August. The conference on the Empire telecommunications system was also in session in July.

Empire War Effort. The British Commonwealth and Empire's contribution to the war effort, as described in statistical terms by Herbert Morrison, Lord President of the Council, on Sept. 8, included 5,500,000 men in the armed services. Casualties, reported by Prime Minister Attlee in the House of Commons on Nov. 29, were 1,246,025, with British losses standing first, India's second and Canada's third. The number of killed was 353,652, wounded 475,070. The remainder were prisoners or missing. The Empire lost 610 ships with a gross tonnage of 1,120,000.

The Colonial Empire. The British Colonial Empire covers 2,215,000 square miles and has about 63,000,000 inhabitants. It includes 55 different areas of diverse sizes, climates and stages of development. All of these territories are free to trade with other countries besides Great Britain but the cost of their defense and development falls chiefly on British taxpayers. Approximately one-fifth of the colonial empire is administered under mandate from the League of Nations.

Colonial Development and Welfare. The Colonial Development and Welfare bill, providing a sum of £120,000,000 for the colonial empire over 10 years beginning in 1946, was introduced in the House of Commons in January by Colonel Oliver Stanley, Colonial Secretary, and speedily passed by the House. The amount provided annually was more than double that made available by the Colonial Development and Welfare Act of 1940. Expenditures from the fund were intended for the financing of development schemes which the colonies could later maintain from their own resources. In the administration of the fund the Colonial Secretary was to be assisted by Sir Frank Stockdale, recently appointed Adviser on Development Planning for the whole colonial empire.

In the House of Lords debate on the bill the view was expressed that the Colonial Office was not yet adequately staffed by administrators of sufficient experience in the preparation and execution of economic projects to carry out the now accepted policy of welfare and development. Opinions differed as to the kind of economic advisory or planning committee which should be developed.

Self-Governing Colonies. The colonies which are nearest to full self-government are Ceylon and Southern Rhodesia. Although the British Government is chiefly responsible for their defense and therefore retains control of their foreign policy, both govern themselves and therefore closely resemble dominions. Ceylon, an island south of India, is the smaller country, with an area of 25,332 square miles, but with the far larger population of 6,100,000. The capital and largest city is Colombo.

For Southern Rhodesia see **BRITISH EAST AFRICA**.

Constitution Offered Ceylon. Self-government on the British model, as a step to full dominion status, was recommended in the report submitted on October 10 by the Commission on Constitutional Reform in Ceylon under the chairmanship of Lord Soulbury. The report, made after a four-months' study in Ceylon by the members of the Soulbury Commission, recommended a parliament with two houses: a Senate of 30 members and a House of Representatives of 95 elected members plus 6 nominated by the Governor General. Until dominion status is attained the Governor General would keep defense and foreign affairs under his control and would appoint 15 of the 30 Senators.

The commission had been boycotted by Ceylon ministers. However, after the plan was issued as a White Paper on October 31 the ministers accepted the arrangement offered as a provisional step, although disappointment was officially expressed over deferring the admission of Ceylon to full dominion status. Vigorous differences of opinion in the various Ceylon communities, along the lines described in the White Paper, were soon apparent. Sinhalese thought the proposals did not go far enough and Tamils felt that they gave too much power to the Sinhalese majority. Strikes in transportation services handicapped Ceylon's industrial progress at the end of the year.

Life of the People. The people of Ceylon, 64 per cent of whom are Sinhalese, are for the greater part Buddhists. In 1942 there were 4,114 Sinhalese and Tamil schools with an attendance of 504,293. English and bilingual schools, the Royal College, the Government Training College, the Technical College and the University of Ceylon supplied other educational services.

The chief agricultural products are tea, rubber, copra, rice and spices. Livestock and minerals are also produced in some quantity. Textiles, rice, coal, sugar and manures are imported. Normally Ceylon's exports far exceed imports.

Other Colonies. The large number of other territories in the category of colonies have attained various degrees of political development. Those with the largest proportion of elected members in their legislatures are Bermuda, the West Indian islands of the Bahamas and Barbados, and British Guiana. Twenty of the remainder have legislatures partly elected and 17 have legislatures wholly nominated by the Governor.

British West Indies. Three important reports on the British West Indies were issued in London in the autumn of 1945: the full text of the reports of the West Indies Royal Commission of 1938-39, completed in December, 1939, but hitherto un-

published except for recommendations made public in February, 1940; a report on the action taken since on the recommendations; and Sir Frank Stockdale's report as Comptroller of Development and Welfare for 1943-44.

The reports gave a far from optimistic picture of the chances for immediate social advance; for, as Sir Frank Stockdale pointed out with great emphasis, the raising of the standard of living of the mass of the people must come before the West Indies can afford to assume a scale of expenditure on education, public health, housing, and other social services which has been only slowly reached in countries with national incomes many times greater per head of population.

Political federation of Britain's Caribbean colonies was proposed in the summer of 1945 by Oliver Stanley, Secretary of State for the Colonies, in a letter to their governors. The colonies concerned were the Bahamas, Barbados, British Guiana, British Honduras, Jamaica, the Leeward Islands, Trinidad and the Windward Islands, in some of which the United States has air and naval bases. Norman W. Manley, president of the National People's Party of Jamaica, endorsed the proposal in October, arguing that federation would have a salutary effect on the status of the Negro the world over and that it was not necessary to wait for self-government for each of the West Indies.

The Colonial Secretary's approval of the setting up of a university college in Jamaica, with a view to its full development as a West Indian university, was telegraphed to the West Indian colonies in September. The project was recommended by the Irvine Committee on Higher Education in the West Indies and endorsed by the Asquith Commission on Higher Education in the Colonies. The next step was to obtain statements of opinion and estimates of proposed contributions from the West Indian governments. A financial grant under the Colonial Development and Welfare Act was expected to help towards the cost of building.

The Anglo-American Caribbean Commission held a series of meetings in Washington in the latter part of July. The membership of the commission was increased in June by two members and a report on the Caribbean tourist trade was issued at about the same time.

Reform in Jamaica. Jamaica (capital, Kingston), with its area of 4,450 square miles, is the most important member of the British West Indian group. In 1945 Jamaica was living under the new constitution proclaimed on Nov. 20, 1944, for a period of five years. There is now a legislature of two houses—the House of Assembly, made up of 32 members elected by universal adult suffrage, and the Legislative Council of members nominated by the Governor. An Executive Committee is made up of 5 members elected by the House of Assembly and 5 nominated by the Governor. The Labor Party, which won the election in December, 1944, remained in power.

The lifting of wartime economic controls in Jamaica made slow progress in the autumn of 1945. The foreign trade of Jamaica continued extremely adverse, especially with reference to the United States. Controls of trade were continued, and an effort was made to balance trade between Jamaica and non-sterling countries as far as possible. It was announced at a meeting of the Jamaican Chamber of Commerce in Kingston on Oct. 10 that imports from sterling areas would be unlimited.

Economic Life. The 1,237,391 people of Jamaica

gain their living largely from the raising of sugar, bananas, coffee, rum and other agricultural products. Cotton piece goods and some foodstuffs have to be imported.

Other Caribbean Colonies. Bermuda has about 260 islands, of which 20 are inhabited. Civil population in 1940 was estimated to be 32,086 and the area is 19.3 square miles. During the war this colony was the location of bases for the British Navy, United States military and naval forces, and the Canadian Navy, and at all times it is a port of call on the New York-Lisbon transatlantic air route.

In the Bahamas group there are 20 inhabited and several uninhabited islands. Nassau is the capital of this colony whose area is 4,404 square miles and whose population was estimated to be 73,217 in 1942. Like Bermuda, the Bahamas cater to a large tourist trade, and engage as well in the production of shell, cascarilla bark, pine timber, sisal and crawfish. The colony of Barbados has a population of about 200,000 and an area of 166 square miles. Its products—sugar, molasses, rum, cotton and aloes—are typical of the West Indies.

The Leeward Islands constitute a federation of four presidencies: Antigua, Montserrat, St. Kitts-Nevis and the Virgin Islands. Total population of the colony was estimated to be 100,500 in 1943. The Windward Islands, also consisting of four islands, include Dominica, Grenada, St. Lucia and St. Vincent. Population is about 220,000 and the combined area of the four islands is 813 square miles.

Trinidad and Tobago form a united British colony near Venezuela which served during the war as a location of United States defense bases. Total area of the colony (with adjacent islands) is 1,980 square miles and total population is about 522,200, most of whom are West Indian natives of African descent.

British colonies in Latin America proper are British Honduras and British Guiana. Honduras, in Central America, produces mahogany, chicle, bananas, grapefruit, cedar logs, coconuts and copra. About 80 per cent of its exports come from the forests of the colony. Its area is 8,598 square miles, and its population is about 62,000. British Guiana is a much larger colony on the northern coast of South America. Its area of 89,480 square miles is inhabited by more than 360,000 people, almost half of whom are East Indians. Products of the colony are sugar, rice, coconuts, coffee, cacao, citrus fruits, gold and diamonds.

South Atlantic Colonies. Southernmost of all the dependencies in the British Empire is the colony of the Falkland Islands, located in the Atlantic opposite the southern tip of South America. Here, in an area of 4,618 square miles, is a population of only 2,435. The chief occupation of the people is sheep farming, except in the small dependencies of the colony where whaling is carried on. Across the Atlantic diagonally from the Falklands is St. Helena, a British colony west of South Africa whose dependencies are Ascension Island and the Tristan da Cunha group. In this instance, a population of about 5,000 is crowded into only 85 square miles. Capital of all the colony is Jamestown, and the chief export product is New Zealand hemp. In Africa proper is the British Gold Coast, a colony of 91,843 square miles with an approximate population of 4,000,000. Main products of this area are cacao, kola nuts, rubber, yams, gold, manganese, diamonds and timber.

Mediterranean Outposts. Gibraltar, between Spain and Africa, has long been called the "gateway of

the Mediterranean." A long mountain called the "Rock" is now separated from the mainland by a canal, but total area still amounts to almost two square miles. The chief occupation of Gibraltar's people is the supply of fuels and provisions to the extensive shipping trade carried on through the "gateway." Because of the colony's strategic position and its fortification as a naval base, 75 per cent of the people were evacuated during the war to Great Britain, Madeira and Jamaica. Another fortified naval base in the Mediterranean is Malta. Population of this colony is about 272,000, while total area is merely 124 square miles. Chief products are barley, wheat, potatoes, maize, oranges, figs, honey, grapes and cotton.

Colonies in the Indian Ocean. Mauritius and the Seychelles are British colonies east of Africa in the Indian Ocean. Mauritius, farthest south, has an area of 720 square miles and population of about 421,000. Sugar, copra, aloë fiber, tobacco and tea are produced. The Seychelles, farther north, consist of 92 islands whose area totals 156 square miles. A population of about 32,000 engages in the production of copra, cinnamon, essential oils, guano and fish.

Hong Kong. Hong Kong is a British crown colony near Canton in South China with an area of 391 square miles, comprising the island of Hong Kong, Old Kowloon and the New Territories leased from China in 1898 for 99 years. The British garrison in Hong Kong surrendered to the Japanese on Dec. 25, 1941. The port was reentered by the British on Aug. 30, 1945.

Prime Minister Attlee said in the British House of Commons on August 23, apparently with rumors in mind that the Chinese might install a military administration in Hong Kong, that "plans for reestablishing British administration in the colony were fully prepared." Cheers greeted the announcement and former Prime Minister Churchill reminded Attlee that at the Cairo Conference in 1943 the representatives of the British Government made it plain that they did not contemplate modification in the sovereignty of His Majesty's territories in the Far East. The reoccupation of Hong Kong proceeded as planned, although residents complained that adequate political and commercial authority was slow in appearing.

The civil population of Hong Kong in 1941 was estimated at 1,050,256, chiefly Chinese. Leading agricultural crops are rice, sweet potatoes, groundnuts, sugar cane and fruits; industries include shipbuilding, the manufacture of cement, and tin refining.

The Colony of Fiji. Fiji is a group of 250 islands east of Australia. Only 80 of the islands are inhabited yet population in 1943 was about 238,000. Total area of the island group is 7,088 square miles, and chief products are sugar, copra, bananas, pineapples, gold and forest products.

Colonies with Protectorates. Several British colonies include protectorates. Aden, in the southern tip of Arabia, is only 80 square miles in size, yet its protectorate has an area of 112,000 square miles. The colony of Aden itself has a population of about 49,000, most of whom are engaged in the production of salt, soap, cigarettes, dhows and cured fish. The colony is a fortified naval base and a free port and fueling station for ships. Kenya colony includes territories in the mainland of East Africa while its protectorate is the coastal belt of those territories which is rented from Zanzibar. Nigeria is a colony and a protectorate which includes the mandated British Cameroons. Far west of Nigeria is Sierra Leone, a colony and a protectorate.

Protectorates. Protectorates of the British Empire are those territories whose governments are in the care of Great Britain with or without the help of a local legislature. Basutoland, Bechuanaland and Swaziland, three territories in South Africa, are administered by one resident commissioner. Basutoland and Swaziland are small areas within the borders of the Union of South Africa, while the larger Bechuanaland lies just north of it. North of Bechuanaland is the protectorate of Northern Rhodesia. Other protectorates in the same section of Africa are Nyasaland, British Somaliland, Uganda and Zanzibar. Gambia, in West Africa, was at one time both colony and protectorate but is now wholly under the protectorate system.

Cyprus is the only British territory in the Mediterranean still under the protectorate system. Its area is 3,572 square miles, and population is about 384,000, most of whom speak a Greek dialect and profess the Greek Orthodox faith. Products of the island are wheat, barley, tobacco, olives, potatoes, raisins and wines.

Two British protectorates, the British Solomon Islands and the Gilbert and Ellice Islands, lie in the South Pacific. The Solomon Islands, situated east of New Guinea, have a land area of 11,000 square miles. Population was 94,105 in 1931, with almost all the inhabitants Polynesian or Melanesian. Chief products are mostly tropical. The Gilbert and Ellice Islands comprise the Gilbert, Ellice and Phoenix atolls and Ocean, Fanning, Christmas and Washington Islands. All of these except Ocean Island are of coral origin. Total population of this protectorate was estimated to be 35,000 in 1938, and its area is 216 square miles. All the islands produce coconuts and pandanus fruits, and Ocean Island has also rich phosphate deposits.

Protected States. Dependencies in the British Colonial Empire which are administered by the British in the name of local rulers include two areas. British North Borneo, Brunei, the Federated Malay States, Sarawak, the Straits Settlements and the Unfederated Malay States form the larger of these, British Malaya. These territories, situated southeast of Asia, have a total area of about 54,000 square miles. The largest city in British Malaya is Singapore.

Reform in Malaya. The British naval base of Singapore, which surrendered to the Japanese on Feb. 15, 1942, was reentered by Admiral Sir Arthur Power, Commander-in-Chief of the British East Indies fleet, on Sept. 3, 1945. The official surrender of southeast Asia took place on Sept. 12. The announcement of proposed constitutional changes followed.

A union of the Malay States, a step frequently discussed in Britain before the Japanese surrender, was proposed in the British House of Commons on October 10 by George Hall, Colonial Secretary. The plan included the establishment of a new Malayan citizenship for those born in the Malayan Union or who have long residence there. In due course the Malayan Union will be enabled to attain full self-government.

Such a change in protected states involves a complicated procedure. It requires fresh agreements with the sultans of the various federated and unfederated Malay states, so that the Crown can have full jurisdiction, after which the Malayan Union can be constituted by an Order-in-Council.

The whole of Malaya contains only three blocks of British territory—the settlements of Singapore, Penang (with province Wellesley) and Malacca. The rest of the country is composed of the four federated states of Perak, Pahang, Selangor and

Negri Sembilan, and the 5 unfederated states of Johore, Perlis, Kedah, Kelantan and Trengganu. Britain is pledged by treaty to uphold the position of the respective rulers. The position is further complicated by the presence of large numbers of immigrants, including more than 2,000,000 Chinese and 750,000 Indians. Malayan citizenship would provide a status for the Malayan-born Chinese whose race and religion prevent the sultans from acknowledging them as subjects.

The new proposal was known to involve difficult and delicate questions. It was not unexpected that questions soon arose, in Britain and in Malaya, as to whether the British Government intended to break faith with Malay rulers, especially in connection with the Treaty of Federation of 1895. Left-wing groups in Malaya, in which Chinese were influential, appeared to think in terms of a Malayan republic. British military activity in Indonesia further complicated the Malayan situation.

Revival of Commerce. Malayan rubber, the absence of which during the Japanese occupation had altered much of the economy of the United Nations, began to return to commerce in the autumn. The first shipment of 500 tons left Singapore on Sept. 18. By the end of November 25,000 tons of rubber from former Japanese stocks was on its way to the United Kingdom and the United States. Lack of labor and trained planters slowed the return to full rubber production. Tools and engineering equipment were required for the restoration of tin production.

At the time of reoccupation Singapore was found to be virtually undamaged, with its roads in good repair and its electric light plant working. After investigating the extent of destitution in the city the British military administration announced the introduction of unemployment benefits. Serious dock strikes in late October by Chinese and Indian workers were in protest against loading ships with ammunition for Indonesia.

Life of the People. The population of British Malaya at the end of 1939 was 5,444,833, with Chinese slightly more numerous than Malaysians. Indians were in the minority. The chief products were rubber, tin, copra, rice and palm oil. Exports, expanded by the inclusion of large amounts of rubber, were very large in 1940. They were valued at \$1,128,169,000, with \$591,931,000 going to the United States. Imports stood at \$830,591,100, but only a small amount was taken from the United States. (Figures are in Straits dollars, worth about one-half of the American dollar at that time.)

Protected State of Tonga. Tonga, a group of 150 islands and islets east of Fiji, is also a protected state. A population of about 34,000 natives inhabits this area of 250 square miles. Chief products are copra, bananas, citrus fruits, taro and fish.

Mandates. Mandates (ex-enemy territories administered for the League of Nations) form six of the territories in the British Empire. Palestine and Trans-Jordan in the Near East and the West African mandated areas of the British Cameroons, Tanganyika and Togoland are administered by Great Britain. Nauru, an atoll in the Pacific, is under Australia, New Zealand and Great Britain.

Palestine. Palestine, a former district of the Turkish province of Syria with an area of 10,429 square miles, has been under British mandate since 1923. Capital, Jerusalem. The territory is administered by a High Commissioner (Lieut.-Gen. Sir Alan Cunningham, appointed on Nov. 8 to succeed Field Marshal Viscount Gort, resigned because of ill health). The Jewish, Moslem and

Christian communities have autonomous control of their religious, cultural and communal affairs.

Events, 1945. British policy concerning Jewish immigration into Palestine was an increasingly controversial issue in 1945. The immediate background of the "Palestine Question" is in the British White Paper of 1939 setting the limit of Jewish immigration into Palestine at 75,000 Jews a year to Mar. 31, 1944. Jews entered Palestine at a slower rate, and the British Government extended the deadline to Mar. 31, 1945.

The World Zionist Conference which was held in London in August, 1945, made public its five-point program (laid before the British Government in the preceding May) which was addressed to the principal allies of the British Government and, in fact, to all of the United Nations. The program in summary was as follows:

1. Creation of a Jewish state in Palestine.
2. Settlement of as many Jews as possible in Palestine and the development of the country's resources.
3. An international loan to help transfer the first 1,000,000 Jews to Palestine.
4. Exaction of German reparations in kind for the rebuilding of Palestine.
5. Provision of international facilities for the exit and transport of all Jews wishing to settle in Palestine.

In comment on this program *The Times* (London) asked for a partition of Palestine, as recommended by the Royal Commission of 1938, in order to protect the political rights of the Arab community. *The Economist* (London) supported the proposal of Dr. Magnes, leader of the Ihud party in Palestine, for a bi-national state with equal political rights for both communities and the inclusion of Palestine in a federation including Syria, Lebanon and Trans-Jordan.

President Truman addressed a letter to Prime Minister Attlee on August 31 on the subject of increased Jewish immigration into Palestine. While conversations between the two governments were going on, the 28th anniversary of the Balfour Declaration (promise by Lord Balfour, British Foreign Secretary, November, 1917, that Britain would provide a "national home" for Jews in Palestine after the war) was marked by an outbreak of violence by Jews in Palestine in early November. On Nov. 13 came the publication of an agreement between the governments of the United States and Great Britain to establish a Joint Committee of Inquiry into the whole problem of European Jews and Palestine and to continue Jewish immigration at the rate of 1,500 a month.

Both Jews and Arabs showed dissatisfaction with the announced program, and rioting in the all-Jewish city of Tel-Aviv continued. When the new High Commissioner, Sir Alan Cunningham, reached Palestine on Nov. 21, Tel-Aviv had become quieter. The Arab League's reply to the British announcement of the proposed Joint Committee of Inquiry, published on Dec. 6, criticized the Zionist attempt to force a Jewish majority in Palestine and asked the democracies, including the United States, to accept voluntary Jewish immigrants. On Nov. 30 it was learned in Jerusalem that after the end of 1945 the British Government intended to withdraw its subsidy to 2,000 Polish Jews who have been supported in Palestine since 1941 at a cost of more than \$3,000,000, since they had signified their wish to become permanent residents of Palestine. Payments to 4,000 others who wished to return were to be continued.

The People. The estimated population of Palestine in 1942 was 1,605,816, including 987,985 Moslems (mostly Arabs), 478,449 Jews, and 126,344 Christians (including some Arabs). In 1918 there were only about 50,000 Jews in Palestine. The increase of the Jews from 7 to 30 per cent of the population has been due mainly to immigration, as the fecundity of the Arabs is greater. Education in Palestine is not compulsory.

Economic Life. Agriculture supports more than one-half of the population, although manufactures have in recent years exceeded agricultural products in value. Citrus fruit is the chief crop, followed by wheat, corn, barley, olives, tobacco, corn and rice. The principal manufactures include clothing, textiles, leather, timber, food products, soap and wine. In recent years imports have greatly exceeded exports, in part because of the need of the expanding Jewish community for supplies for its new and partly-developed projects. The chief countries with which trade is carried on are Great Britain, Egypt, the United States, Syria and Turkey. In 1942 imports stood at £19,504,103 and exports at £3,061,828.

Other Mandates. Trans-Jordan, an Arab country in western Asia, was mandated to Great Britain with Palestine in 1923. Its area is 34,740 square miles, and present population is estimated to be 350,000. Principal occupations of the country are stock raising and primitive agriculture. Wheat, barley, tobacco, phosphate and potash are produced, and a limited trade is carried on with Palestine and Iraq. Smallest of the British mandates is Nauru, an atoll in the Pacific controlled by Great Britain, Australia and New Zealand since 1920, except during the period of Japanese invasion. The area of Nauru is 8.22 square miles. Its population (2,672 in 1942) is made up of Nauruans, Chinese, Europeans and other Pacific islanders. The chief product of the territory is phosphate.

Condominiums. Condominiums of the British Colonial Empire are those territories jointly administered by Great Britain and other countries. The Anglo-Egyptian Sudan, a British-Egyptian condominium, is administered by a Governor General appointed by the King of Egypt with the approval of Great Britain, with native authorities in charge of local affairs. The territory is 967,500 square miles, with a population of about 6,590,996 Arabs, Negroes and Europeans. Principal crops are great millet and cotton, and 80 per cent of the world's supply of gum arabic is produced in the Sudan.

Similar to the Sudan in type of dependence but jointly controlled by Great Britain and France are the New Hebrides, a group of islands in the South Pacific. Total area of the islands is 5,700 square miles, and population in 1941 was 43,130, most of whom were natives. Chief products are copra, cacao, coffee and vanilla.

The Canton and Enderbury Islands form a third condominium whose administration is shared by Great Britain and the United States. The more important of the two islands is Canton, which served during the war as an important link in the air transport route to battle fronts of the southwest Pacific and as a base for air patrol operations.

ALZADA COMSTOCK.

BRITISH HIGH COMMISSION TERRITORIES IN SOUTH AFRICA.

The areas of these three native Territories adjacent to the Union of South Africa are: Basutoland, 11,716 sq. mi.; Bechuanaland Protectorate, 275,000 (approx.) sq. mi.; Swaziland, 6,705 sq. mi.

Government. They are under the general supervision of a High Commissioner who is also the High Commissioner for the United Kingdom in the Union of South Africa. There are Resident Commissioners in each of the Territories. The Territories are under the control of the Dominions rather than the Colonial Office.

Basutoland consists entirely of a native reserve, with a European population of less than 1,600 out of a total of 660,000 inhabitants. The government is monarchical and aristocratic, under a single Native Authority, of which the executive and judicial functions are exercised by a Paramount Chief, or at present by a Regent. Basutoland is a crown colony, having been annexed in 1871. The capital is Maseru.

Bechuanaland is a protectorate containing eight separate Native Authorities, each with its own governmental apparatus and financial system. The Native Advisory Council is attended by the eight Chiefs but has no executive functions. The administrative capital is at Mafeking (Cape Province). In addition to the land reserves of each of the eight tribes, there are several areas owned by European cattle-raisers. Europeans number less than 2,000 out of the population of 270,000.

Swaziland has some 160,000 inhabitants, of which 2,700 are Europeans. Yet only one-third of the country is native reserve, the rest being the property of Europeans. The Paramount Chief shares executive and judicial functions with the Resident Commissioner. The Swazis are a backward people and unlike the Basuto and Bechuana are not Christians. Mbabane is the capital.

Events, 1945. The Union of South Africa continued to press the British Government to cede the three Territories. This campaign, which had been going on for many years, has been resisted in Britain by those who feel that the Union's native policy is too harsh and unenlightened, and that Britain would therefore betray her trust toward the inhabitants of the Territories by surrendering them to South African rule. The South Africans point out, by way of proving their case, that the Territories are already almost wholly dependent economically on the Union, with which in fact they are joined in a Customs Union.

Among the Africans serving in Italy early in 1945 were 20,000 from Basutoland, over 9,000 from Bechuanaland, and 3,500 from Swaziland.

A scientific expedition, led into the Kalahari Desert of northern Bechuanaland during the winter of 1945 by Senator E. A. Conroy, Union Minister of Lands, demonstrated that there were possibilities of canalizing swamps and irrigating large areas in that arid region.

The People and Their Economy. The Basuto live in a highland area with considerable rainfall (snow in winter) and produce sheep, some cattle, wheat and other grains. In 1943 they exported 7,321,667 lbs. of wool to the Union. Their living and health standards are high for Africa, they are educationally advanced, and many of the young men work in factories and mines in the Union. The government has a sizable surplus and no debt.

In Bechuanaland rainfall is deficient, temperatures are high, the soil is poor, and the people and government are consequently poor. Malaria, sleeping sickness and cattle diseases abound. There are no secondary schools. The Bechuana, who still live in a tribal state, largely follow pastoral pursuits. It is estimated that they own over 800,000 cattle and 550,000 sheep and goats. Yet despite their handicaps the Bechuana are making progress.

Swaziland is the least advanced of the three—

hot, wet, malarious and poor. The inhabitants are almost wholly uneducated and their government balances its budget only with help from the British taxpayer. Unlike the Basuto and the Bechuana, the Swazi still dress in the ancient native fashion. The native economy rests largely on cattle-raising.

ROBERT GALE WOOLBERT.

BRITISH WEST AFRICA. Under this heading are grouped four non-contiguous areas lying along the west coast of Africa from the Bight of Biafra almost to Cape Verde. The major political divisions comprising British West Africa are: Gambia, 4,068 square miles; Gold Coast, 91,843 square miles (including Togoland, 13,041 sq. mi.); Nigeria, 372,599 square miles (including British Cameroons, 34,081 sq. mi.); and Sierra Leone, 27,925 square miles.

Government. The constitutional arrangements in the various part of British West Africa run a wide gamut.

Nigeria consists of a Colony (a small area around Lagos) and a Protectorate, divided into Northern, Eastern, and Western Provinces. In addition, the British mandated territory in the Cameroons is treated administratively as a part of Nigeria. The Governor is assisted by an executive council containing both official and unofficial members. Legislation for the Colony and the Eastern and Western Provinces of the Protectorate emanates from the Legislative Council, the members of which are partly elective and some of whom are Africans. Laws for the Northern Provinces are made by the Governor.

In the Protectorate, notably in the Moslem Northern Provinces, a wide degree of "indirect rule" is practised, having originally been introduced in Nigeria by the late Lord Lugard. Native sultans, chiefs and other hereditary rulers thus carry on much of the work of government at the local and provincial levels. Many Africans are employed in the colonial administration and judicial service, and some of them rise to high office. Lagos is the capital.

Gold Coast consists of a Colony, Ashanti and the Northern Territories. The British mandated zone in Togoland is united administratively with the Gold Coast. In the Colony the Governor is assisted by Executive and Legislative Councils. Under the terms of the new constitution the latter should contain six official members, nine elected provincial members, four members chosen by the Ashanti confederacy council, five municipal members and six members nominated by the Governor. There is thus an unofficial majority. The Governor will continue to legislate for the Northern Territories.

Ashanti and the Northern Territories are administered by Chief Commissioners, with wide local powers left to the chiefs and their councils. The Africanization of the administration and judicial services, as in Nigeria, proceeds apace. Accra is the capital.

Sierra Leone and Gambia each consist of a small Colony around the capitals (Freetown and Bathurst, respectively) and much larger Protectorates in the interior. In both cases the Executive and Legislative Councils contain official majorities. There is African representation but these bodies have only advisory powers.

During the war the British Government appointed a Resident Minister in West Africa, whose function it was to coordinate political and economic affairs in this strategically vital part of the empire. It is widely felt that this pattern of co-operative effort should be continued and strength-

ened in the future. There is already in existence a West African Currency Board and a uniform monetary system.

Events, 1945. The experiment of closer wartime cooperation between the colonies under a Minister Resident proved the worth of a permanent body to carry on this work. The Secretary of State for Colonies, Mr. George Hall, declared in the House of Commons on October 17 that a West African Council consisting of the four Governors was to be established with its center in the Gold Coast. One of the most urgent problems confronting all the colonies of West Africa was the reintegration of some 200,000 soldiers who had fought in the Burma and other campaigns.

In Nigeria the outstanding political event was the publication of a White Paper containing proposals for a revised constitution prepared by the Governor, Sir Arthur Richards. The latter stated that the problem of Nigeria was to create a political system which is itself a present advance and contains the living possibility of further orderly advance. His recommendations provide for a widening of the scope and membership of the Legislative Council and the creation of regional councils in each of the three provinces of the Protectorate.

The reformed Legislative Council would have 20 official and 29 unofficial members, and an African majority of 25 to 24. It would legislate for the country as a whole and all of Nigerian affairs would be subject to its purview, including the Northern Province. This instrument would be in force for nine years, subject to review at the end of that time. The debate on these proposals in the Legislative Council on March 23 showed the unofficial members generally favorable. However, protest meetings indicated that public opinion was far from single-minded on the subject.

On June 22 a general strike was called in Nigeria, contrary to the advice of union leaders. It dragged on until August 4, when new leaders persuaded the men to return and discuss the issues with the government. In this discussion the authorities made it clear that no obstruction would be put in the way of developing trade unions.

During the year plans for a £40,000,000 program of general development in Nigeria over the next decade were elaborated. The cost of this was to be borne partly by the colony and partly by the Colonial Development and Welfare Fund. Lesser sums were to be spent on similar programs in the smaller colonies.

In the Gold Coast, the world's greatest supplier of cocoa, the subject of how that crop was to be controlled created an international problem. The American importers objected to the control scheme proposed by the Churchill government, especially its price features. The proposal was never put into effect.

When the Labor Party took over in August, renewed anxiety was expressed by both foreign importers and the native growers in West Africa. In September the British Government was reported to have decided to buy the 1944-45 crop through the West African Produce Control Board, but at a higher price. Still the growers objected and sent a delegation to London, while the president of the Cocoa Exchange in New York assailed the manner in which Great Britain was said to be holding up cocoa shipments.

Population. Nigeria is the most populous of all the British crown colonies, with over 21,000,000 inhabitants, plus nearly 900,000 in the mandated territory of the Cameroons. The Gold Coast con-

tains over 3,500,000, together with 400,000 in Togoland. In Sierra Leone there are 1,850,000 inhabitants, and in Gambia 200,000. This makes a total of nearly 28,000,000, of whom only a fraction of one percent are Europeans. This is definitely Black Africa, most of the natives being Sudanese Negroes.

The manner of life depends largely on the climate. The southern parts of Nigeria and the Gold Coast are characterized by heavy rainfall. The natives here are pagans, except those that have been Christianized; and the advent of the European has tended to break down tribal organization. North of the rain forest lies the more open Sudan country where Islam is the religion professed by most of the people. The political institutions and cultures of these kingdoms, sultanates and the like have proved more resistant to change than those of the coast Negroes.

Sierra Leone and Gambia have a few coastal centers—Freetown's population is nearly 100,000—but the inhabitants of the interior have been touched only lightly by European ways.

Education. Educational opportunities vary widely. Many of them are afforded by missionary schools, sometimes assisted by government subsidies. The Christian missionaries find in the Moslems very real competitors for the allegiance of the remaining pagans. Christian missions also provide various health and social services as well as schools. A relatively small part of the population receives any but the scantiest schooling, and more emphasis on secondary and technical education is a great need in British West Africa.

Education of college grade is obtainable at Fourah Bay in Sierra Leone (affiliated with the University of Durham), Achimota in the Gold Coast and Yaba in Nigeria. Several proposals have recently been made for the creation of a West African university, either by the association of the existing colleges or by establishing a wholly new institution, probably in Nigeria.

Economy. One of the notable features of native agriculture in Nigeria and the Gold Coast is the large number of native cultivators of cash export crops, particularly cocoa and palm oil and kernels. The Gold Coast produces over 40 percent of the world's cocoa, largely on small peasant farms of less than five acres. The export business has, however, been in the hands of European companies, and this has caused much friction. Likewise in Nigeria much of the cocoa, palm products, peanuts, cotton, etc., is produced by natives on small tracts. Critics have pointed out that, however desirable this form of production may be for social reasons, it cannot compete successfully against the plantation-grown produce of such places as the Belgian Congo, Malaya, and the Dutch East Indies.

The coastal forest belt is not suitable for livestock, because of the prevalence of the tsetse fly. But on the northern plains domestic animals can be raised with considerable success, and horses are a common sight there. In the forests are found valuable woods like mahogany and cedar. The cultivation of cereals is suited to the drier northern regions, as is peanut and cotton culture. The principal export crop of Gambia is peanuts and of Sierra Leone palm kernels.

The mineral output of these colonies is far from negligible. The Gold Coast is an important producer of diamonds, gold, and manganese ore. Nigeria's mineral exports include tin ore, gold, and coal. Sierra Leone produces small quantities of iron ore and gold.

The relative importance of British West Africa

in world trade will be seen from the following figures: Gambia (1941)—imports, £503,303, exports £290,087; Gold Coast, including Togoland (1943)—imports £7,680,000, exports £11,880,000; Nigeria (1942)—imports £9,700,000, exports £13,700,000; Sierra Leone (1941)—imports £3,814,391, exports £1,592,608. These statistics do not by any means accurately reflect the total production of the colonies, particularly Nigeria, which has a large internal trade. As in the case of all raw material producing countries, the chief imports are manufactured goods and certain foodstuffs (rice, sugar, fish, salt) not obtainable locally.

In normal times British West Africa is served by the shipping lines of many countries. The principal ports are Lagos, Port Harcourt, Takoradi, Freetown (much used for naval purposes during the war) and Bathurst. Nigeria has some 2,500 miles of railway, the Gold Coast nearly 900, and Sierra Leone over 300. Road conditions vary, but in general they can be said to have improved considerably under the impetus of war necessity. Before the Mediterranean was opened in 1943 to Allied shipping, Britain and the United States, working together, built airports and other facilities in West Africa and the Sudan so that high priority material and persons could be transported quickly to the Middle East and India-Burma-China theaters.

ROBERT GALE WOOLBERT

BROOKINGS INSTITUTION. A non-profit corporation devoted to research and training in economics and government. In 1945 the institution conducted a program of research dealing with both domestic and international problems. Research fellowships, which were discontinued at the outbreak of the war, have not been resumed, but it is expected that they will again be granted in 1946. The income of the institution is derived from grants from foundations, its own endowment, and the sale of publications.

Publications resulting from its research program in 1945 included the following: *International Tribunals: Past and Future*, by Manley O. Hudson; *Labor Policy of the Federal Government*, by Harold W. Metz; *Postwar Fiscal Requirements*, by Lewis H. Kimmel and associates; *Debtor and Creditor Countries, 1938-1944*, by Cleona Lewis; *Should Price Control Be Retained?* by Harold G. Moulton and Karl T. Schlotterbeck; *Business Leadership in the Large Corporation*, by R. A. Gordon.

The home of the Institution is situated at 722 Jackson Place, Washington, D. C. Its officers for 1945-46 were: Chairman, Dwight F. Davis; Vice Chairman, Dean G. Acheson; President, Harold G. Moulton; Vice President, Edwin G. Nourse; Treasurer, Henry P. Seidemann; and Secretary, Elizabeth H. Wilson.

BROOKLYN INSTITUTE OF ARTS AND SCIENCES. One of America's oldest and largest institutions for informal education, located in Brooklyn, N.Y. Its public activities are conducted at four centers: The Department of Education at the Academy of Music, the Central Museum, the Children's Museum, and the Botanic Garden. Founded in 1824, the Institute was incorporated in its present form in 1890. Total membership is about 5,000 and is open to everyone.

The Department of Education at the Academy of Music presents an adult education program annually of concerts, lectures, forums in every major field of the arts and sciences. Approximate attendance at these events for the season 1944-45

was 250,000. The Institute's Museums possess collections in art, ethnology, and natural science. During 1941, the Art and Photography Classes formerly conducted at the Department of Education at the Academy of Music were transferred to the Brooklyn Museum to form the new Art School of the Brooklyn Museum. Attendance at both Museums for the year 1945 totalled 515,358. The Institute's Botanic Garden comprises more than 50 acres and plant houses containing tropical and sub-tropical species. Botanic Garden attendance during 1945 totaled 1,201,417.

Mr. Edward C. Blum is Chairman of the Board of Trustees and Mr. Adrian Van Sinderen President of the Brooklyn Institute. Julius Bloom is Director of the Department of Education, Mrs. Laurance P. Roberts, Director of the Brooklyn Museum, and Dr. George S. Avery, Jr., Director of the Botanic Garden.

BUDGET, Bureau of the. A division of the Executive Office of the President, transferred from the Department of the Treasury in 1939, which assists the President in the preparation of the Budget and the fiscal program of the Government. Its chief branches pertain to Legislative Reference, Estimates, Administrative Management, Statistical Standards, and fiscal programs (the Fiscal Division). Special activities at the present time include the War Projects Unit, which reports upon all war construction projects and makes recommendations toward increased efficiency and economies, the Committee on Records of War Administration, and the Equipment and Supply Section, which surveys supplies in government agencies and assists in the redistribution of surpluses. Director: Harold D. Smith.

BUHL FOUNDATION. A foundation established in 1928 by Henry Buhl, Jr. Capital assets were \$12,502,314 in 1945, and expenditures for the year totaled \$189,632. The Foundation's programs center in the Pittsburgh area, where it has sought to provide more adequate factual bases for social work and regional economic effort, to promote research in public health and the natural sciences, and to develop the community's resources in higher education. Another objective is the advancement of housing standards for American cities, as exemplified in large-scale, planned communities administered on a long-term investment basis. In demonstration of this last-named objective, the Foundation operates Chatham Village in Pittsburgh, built in 1932 at a cost of \$1,700,000. The Buhl Planetarium and Institute of Popular Science was built at a cost of \$1,100,000 in 1939 as a gift to the people of Western Pennsylvania. Director: Charles F. Lewis. Offices: Farmers Bank Building, Pittsburgh 22, Pa.

BUILDING. Although the United States has not experienced the wholesale destruction of buildings which other war countries have suffered, there is still a great need for vast numbers of new buildings of every kind. This need has not been met adequately, and even with war restrictions relaxed or cancelled, actual construction has continued far below requirements. This results from shortage of men and materials, price regulations, labor troubles, difficulties of finance, and tardiness in completing plans and preliminaries for placing contracts. Structures needed include factories and industrial buildings, public buildings, hospitals, churches, schools, apartments, and various institutional buildings.

Residential buildings and housing projects form a special problem, but relief from the shortage of civilian accommodations will be slow, and will depend largely upon prices and the availability of men and materials. One result of the shortage is the increasing practice of converting one-family residences to accommodate two or more families. With peace established, the National Housing Agency abandoned its war program and concentrated upon the serious problem of civilian housing, particularly for men discharged from the military forces. Mass construction has not reached large proportions, and there are too many individual designs in proportion to the number of buildings erected. For temporary relief, authorities have planned to use a number of war units, both for domestic use and for export, but knock-down or prefabricated buildings are not always satisfactory.

Many new ideas and materials, developed under war conditions, include structural members of light pressed-steel shapes, laminated wood, and precast concrete; also panels of steel, aluminum, plywood, plaster, asbestos and concrete; and thin-shell concrete for domes and roofing. Glass blocks have become established among building materials, and have been recommended as substitutes for windows in factories and railroad engine houses where smoke and fumes corrode steel and wood framing. The U. S. Army has built a number of one-story steel prefabricated warehouses, 20 x 100 ft., and in the Philippine Islands, several one-story 1,000-bed hospitals having pressed steel frames and steel sheathing.

There is some advance in standardizing the dimensions of building materials, both to reduce the number of sizes and to eliminate the excessive and wasteful cutting and fitting at individual buildings. This movement has expanded into what is termed "modular" design, in which a complete structural unit (comprising perhaps a wall, pier and window) may be repeated to form a building of any desired size. The aim is to economize in time and cost of design and construction.

Municipal building codes hamper progress, in many cases, through being old and failing to provide for modern materials and advancing knowledge, while various other interests oppose modernization. Some States (including Wisconsin, Indiana and Ohio) have State building codes, and this idea is spreading, as a means of reducing construction costs. A general revision of building codes has been recommended by the U. S. Chamber of Commerce, and the National Fire Protection Association. The Pacific Coast Building Officials Conference has a uniform code (1943) in use in 375 cities, and its use is spreading to the mid-west. It is to be revised in 1946. The slum area is a factor affecting building developments in many cities, and St. Louis has an anti-slum committee to plan the rehabilitation of blighted areas.

Tall buildings of the "skyscraper" type are infrequent, but Rockefeller Center, in New York, is to have a 33-story office building. That city is also to have a 32-story concrete structure for warehouse and manufacturing purposes. A curious feature will be a 30-ft. driveway of 6% per cent grade extending to all floors for the use of motor trucks and built around a court 200 ft. square. Some housing projects plan buildings of 10 to 15 stories.

The question of what would happen to tall buildings in case of bomb attack was answered in part in New York on July 28, when a 10-ton Army bombing plane, lost in a fog, struck the 102-story steel-frame Empire State Building at the 78-79th story level at about 250 miles an hour. Several

persons were killed. Fire was started by the high-octane gas of the plane, but the fire department had it out in 40 minutes. A steel column at the point of impact was not damaged seriously, and other structural damage was slight. Flying fragments cut the elevator cables. However, the case is not directly comparable with that of bombs falling upon a building, as in war-wrecked cities of Europe.

Earthquake shocks and vibrations had to be considered in designing the Tripler Hospital of the U. S. Army in Hawaii, a multi-story structure providing 2,000 beds. All column foundations were tied together for uniform action and the superstructure was divided into 12 sections by vertical joints to provide for varying deflections under earthquake forces. Three great timber hangars, 1,058 x 240 ft. in plan and 171 ft. high, of the U. S. Navy at Richmond, Florida, were wrecked in the September hurricane and then destroyed by fire.

Moving residences to new and distant locations is a special class of work, illustrated by the moving of 109 two-story timber dwellings for industry employees from Ravenna, Ohio, to Detroit, a distance of 260 miles. Sectionalized and taken apart into some 600 units, all match-marked for reassembling, they were carried by motor trucks and trailers. Several hundred new buildings of a Federal housing project at Windham, Ohio, were moved to Columbus for the use of servicemen with families. Several structures of a housing project at Vanport, Oregon, were cut apart and transported by motor trucks to the Navy Yard at Bremerton, Wash. In abandoning Camp Hale, in Colorado, the wood buildings were taken down by German prisoners, the roof trusses, hardwood floors and other parts being salvaged.

The lack of housing accommodation and even shelter throughout Europe is a most serious problem and its solution is far from being effected. In Britain, numbers of emergency buildings are being composed of light steel welded frames sheathed with panels of asbestos, cement or concrete. But where there were normally about a million building workers, there are now 400,000 such men. A portable hangar has been devised, in which each frame consists of two vertical legs in the walls, while two inclined legs form the roof. Reinforced concrete for skyscrapers and other large buildings is being used extensively in some cities of South America, and a study of this development shows marked differences from practice in the United States. In South Africa, the government is building some 6,000 houses for returning veterans. (See ARCHITECTURE.)

E. E. RUSSELL TRATMAN.

BULGARIA. A Balkan kingdom in southeast Europe. Ruler: King Simeon II (born June 16, 1937; ascended the throne on Aug. 28, 1943). Total prewar area: 39,825 square miles. Population (estimate of Jan. 1, 1940): 6,308,000. Chief towns: Sofia (capital) 401,300 inhabitants in 1942, Plovdiv (Philippopolis) 113,000, Varna 78,000, Ruse (Ruschuk) 52,000, Burgas 41,000. Vital statistics (1943), based on prewar boundaries: living births, 21.1 per 1,000; deaths, 14.2; marriages, 12.5; infant mortality, 144 deaths under one year per 1,000 live births.

Education and Religion. In 1938-39 there were 252 kindergartens with 12,702 pupils, 4,743 public elementary schools with 596,111 pupils, 2,044 secondary schools with 360,786 pupils, and one State University (at Sofia) with 6,030 students.

The American College at Sofia, with about 400 students, was closed Sept. 12, 1942. The 1934 census showed 5,128,890 members of the Orthodox Church of Bulgaria, 821,298 Moslems, 48,398 Jews, 45,704 Roman Catholics, 23,476 Armenian-Gregorians.

Events, 1945. Bulgaria's problem in 1945 was to advance as far as possible along the road to renewed sovereignty after its defeat as an Axis satellite and its occupation by Russian armed forces. Final authority was vested in an Allied Control Commission with British, American, and Russian representatives, but the Russian factor was dominant and the occupying troops were Russian. The presence of foreign controls naturally affected the political life of the country and was paramount in international relations, but the internal political scene presented at least the appearance of uncontrolled competition, with the presence of an occupying power manifested only in the greater assurance and vigor of the party which that power favored. Sovereignty was theoretically vested in a Regency, acting for the King during his minority, and government was in the hands of the Fatherland Front, a coalition of parties which had participated in the resistance to the German suzerainty, comprising the National Agrarian Union, Zveno, Communists, and Social Democrats. Among the parties the political activity of the year centered on the efforts of elements sympathetic to the Communists or to Russia (not necessarily identical) to gain control of the disparate parties and so of the Fatherland Front, the ultimate aim being that the Fatherland Front with complete pro-Communist and pro-Russian coloring should prevail at the national elections, which were held, after delays, on Nov. 18, and so legitimize itself as the recognized government of Bulgaria and obtain foreign recognition as such. The devices by which the Fatherland Front succeeded in overcoming its opposition and achieving success at the polls were questioned with varying degrees of disapproval or indignation by friends of the opposition within and without Bulgaria, but it appears that the Fatherland Front government and its Soviet sponsors sought to conform to normal political practices and to preserve the forms of democratic procedure, according to the Slavic concept. It is probable that the final solution, though not representing the degree of unanimity which the balloting might suggest, did in fact represent the will of the majority of Bulgarians. Opposition organs did not enjoy the freedom accorded to the opposition of the British-sponsored governments in neighboring Greece, but foreign criticism of Russian pressure upon internal Bulgarian affairs was disarmed when the British found themselves constrained to intervene directly in the formation of a Greek government late in November.

The tactic by which opposition groups were neutralized followed a regular pattern. In each party a dissident group under a leader more sympathetic to the Russians and Communists arose and in course of time gained ascendancy. Thus on Jan. 21 Dr. Georgi M. Dimitrov (not to be confused with the Bulgarian Communist leader of the same name), who had a record of pro-British sympathies and services and had been protected by Britain during his exile (February, 1941, to September, 1944), resigned as secretary of the National Agrarian Union and was succeeded by Nikola Petkov, who seemed more contented with the lesser role the Agrarians were playing in the Fatherland Front. By May 23 agitation against

Dimitrov as an agent of reaction had become so threatening that Dimitrov sought asylum first in the home of a British official and then an American. But Petkov, though less distasteful to the Communists and Russians, still diverged too sharply from their interests, and so a dissident group arose under Alexander Obbov, which in time dominated the party. In a parallel development in the Socialist Party Dimitar Neikov played the role of Obbov. Among various organizations not primarily political an effort was made to consolidate those of parallel interests and give the dominant position to the group sympathetic to the Communists. This maneuvering had in view a Communist victory in the elections, which constituted the focus of political interest during the year. On February 18 Minister of the Interior Anton Yugov (Communist) promised that elections would be held soon, and on April 13 he promulgated the draft of his electoral law. This provided that (1) voting for deputies should be direct, free, and secret; (2) the franchise was to be exercised by all over 18 regardless of sex, nationality or religion; (3) the proportional electoral system was to be employed; (4) the opposition might participate and submit lists of candidates; (5) trade organizations, unions, cooperatives, or any group of ten voters might put up their own candidates; (6) only individuals of proven fascist sympathies would be deprived of the right to vote. With undisputed control over the Fatherland Front, the General Workers' Trade Union, the active Women's Union, and the Sports Federation, the position of the Communists was strong, and with a single ticket offered by the Fatherland Front instead of separate tickets offered by its components there could be no doubt that they would win. In a speech on July 1 Foreign Minister Petko Stainov, himself a Zveno man, declared the election must be a plebiscite for or against the Fatherland Front. A day would come, he said, when each Fatherland Front party might ask for popular approval of its own platform, but now it was a question of saving Bulgaria and showing a united nation at the peace conference. Pressure was exerted upon opposition groups to withdraw their lists when it was too late for others to be substituted. Lists of candidates were so arranged that votes against the Fatherland Front would be votes against Zveno or others but not against the Communists.

The elections were scheduled for August 26, but on August 13 the opposition received the support for which it had been hoping since January. On August 13 the Regents, the Prime Minister, and party chiefs received a letter from Maynard Barnes, American representative on the Allied Control Commission, giving the views of the United States that whereas the electoral law was satisfactory, political maneuvers had made the conduct of a fair election impossible. Prime Minister Kimon Georgiev characterized the Barnes note as an unwarranted interference in Bulgaria's internal affairs. On August 14 the U.S.S.R. countered by recognizing the Fatherland Front as the legitimate government of Bulgaria. The opposition ministers threatened to resign from the government if the elections were not postponed, and 80 opposition candidates withdrew from participation in the election. On August 15 Georgiev flatly rejected the proposal for postponement. On August 16 Ministers Pavlov, Derzhanski, Chsmeczhev, and Stoyanov resigned, and on the following day were replaced by others. The Fatherland Front was disturbed by the turn of events, especially the withdrawal of the opposition candidates, but

celebrated the recognition by Russia. On August 19 Secretary Byrnes made the Barnes note public in an official statement, and on the following day Foreign Minister Ernest Bevin put the weight of the British Government behind the United States policy of nonrecognition. The Soviets countered by releasing Georgi Dimitrov from Russian citizenship, so that he could proceed to Bulgaria to participate in the elections. On August 22 there was no hint that the Fatherland Front government would yield to Allied demands, but diplomatic exchanges in the days following and apparently Russian advice caused a shift in policy, and on the morning of the 25th it was announced that the elections scheduled for the following day had been postponed. The postponement greatly heartened the opposition and shook the structure of the Fatherland Front; on the other hand it made Russian sponsorship of the Fatherland Front government more direct. The new date for the elections was fixed as November 18, the opposition groups were invited to discuss changes in the electoral law, and certain other concessions, such as expanded freedom of the press, were granted to them. But the Fatherland Front soon again stiffened its attitude, and the opposition again complained of unfair maneuvers and urged abstention from the election. Immediately preceding the new date the United States again intimated it might not recognize the results as conclusive, but the elections were carried out as scheduled and the Fatherland Front government was returned to power.

In its attitude towards foreign powers the Fatherland Front government has adhered consistently to a gradation indicated in its formal declaration of January 10: "In the field of foreign policy the Fatherland Front groups stand for eternal friendship with the great Russian nation, for the closest possible alliance and fraternal collaboration with the peoples of the new Yugoslavia, and for friendly relations with the nations of Britain, America, France and the remaining neighbors and freedom-loving nations." The Fatherland Front was oriented completely towards Russia, and the opposition sought aid and comfort from the Western allies and so created a certain strain between the U.S.S.R. and the Western allies on the question of Bulgaria. Differences of opinion in regard to the quality of the democracy practised in Bulgaria were but one manifestation of the strain. In the Allied Control Commission it was clear from the start that the Russian General Biryusov was the paramount power. Hostility to the British representative was almost open, and while greater courtesy was shown the American, American effectiveness was also hampered. It was only on July 10 that the United States representative on the Commission was informed by General Biryusov that henceforth orders would be issued in the name of the Allied Control Commission only after consultation with its British and American representatives. Even so the British and American representatives were not allowed complete freedom of movement. When taxed with the inequality of the balance, the Russians cited the analogy of the dominant position of the Western allies in the Italian commission. The Moscow and Sofia (as well as Belgrade and Tirana) radios, if not the official Soviet spokesmen, could call attention to the British support of reactionary elements in Greece during most of the year, and point by contrast to the vigorous efforts made in Bulgaria to eradicate the pro-German reaction and introduce democracy. Thus the Russians had turned over to the Bulgarian People's Court for trial the

members of the pro-German governments. At the end of January there were sentenced to death and promptly executed the three Regents, Prince Kyril, Filov, and Mihov; eight former court councillors; two former Prime Ministers (Bozhilov and Bagrianov), twenty members of the Filov and Bagrianov Cabinets, and many members of the Twenty-fifth National Assembly. Former Prime Minister Muraviev and his Minister of Interior Dimov were sentenced to life imprisonment, and there were other sentences of imprisonment. U.S.S.R. opinion approved of the sentences as a necessary purge to insure tranquillity; British opinion regarded them as directed against the enemies of Communism rather than the friends of Fascism.

In other respects also Russia sought to show that it acknowledged its position of primacy in Bulgarian affections. It made serious efforts to aid in the reorganization of the country's economic life and in reconstruction, and without urging changes in the rights of private property and free enterprise. The resolutions passed by the conference of industrialists in Sofia in January show no radical change from prewar concepts, and the "Freedom Loan" which was launched during the same month was premised on the continuation of small free enterprise and private property. It was a mark of Russian recognition of Bulgarian services when General Vladimir Stoichev, commander of the First Bulgarian Army in Hungary and Yugoslavia, marched beside Marshal Feodor Tolbukhin in the victory parade of the Third Ukrainian Army in Red Square in Moscow on June 25. On the other hand the Russians took steps to promote pro-Russian and pan-Slavic sympathies in Bulgaria, through cultural propaganda, through spelling reforms which brought the language nearer the Slavic norm, and through patronage of the Church. The All-Slav Congress which convened in Sofia on March 3 and 4 was actually a vehicle for Soviet propaganda, though Foreign Minister Stainov sought to allay Allied apprehensions by calling the meetings cultural. Delegates from other Slavic countries were outstanding Communists, and among the subjects discussed were the advantages of Russian as a common language and the question of a Federated Macedonia. The election of Georgi Dimitrov and Vasil Kolarov as representatives of the (Communist) Workers' Party to the National Committee of the Fatherland Front was an indication of Russia's plan for a permanent order in Bulgaria. Both men have a history as outstanding Bulgarian Communists, were key figures in the Third International, and have been closely identified with Soviet policies. Dimitrov was much publicized; his photographs appeared everywhere, and he was named to the honorary presidium of almost every gathering. His only official connection with Bulgaria, until he was released from Soviet citizenship, was his nominal membership in the Communist Party presidium and in the National Committee of the Fatherland Front. It was rumored that Dimitrov was slated to be president of Bulgaria, of a South Slav Federation, or even of a Balkan Federation. Eventual federation at least with Yugoslavia was implied in the Fatherland Front program, but there was still no open campaign for such federation. There was close cooperation in education and in railroad administration in the border regions, there were joint Tito and Fatherland Front celebrations, and various organizations in each country sent delegates to the other. Bulgaria maintained nominal diplomatic relations not only with Yugoslavia but also with Rumania

and with Turkey, Sweden, and Italy, and had diplomatic representatives in Moscow and Paris. The British protested the exchanges with Yugoslavia and Rumania on the ground that ex-enemy countries were not to be allowed to resume diplomatic relations before a final peace settlement. During the early part of the year Bulgaria was subjected to strong pressure by Greece for territorial and other indemnities. In Bulgaria this pressure was regarded as inspired by the British, and served to strengthen the bond with the Soviets. With the installation of a more democratic regime in Greece and the consequent abatement of its nationalist truculence against its northern neighbors, Russia announced it would send an ambassador to Greece (Nov. 29), and it appeared that Greek claims would no longer entail British hostility to Bulgaria. Bulgaria appeared to be securely in the Russian orbit, with the consent of the majority of its population. It appeared also that with the acquiescence of the Western allies in the situation Russia would relax its suspicions of the opposition elements and implement its professions of regarding Bulgaria as a federated ally rather than a subjugated enemy.

At the meeting of the Big Three Foreign Ministers in Moscow in December, it seemed clear that Great Britain and the United States also regarded Bulgaria as in the Russian orbit. Whereas it was decided that the three great powers were to advise Rumania jointly on the reorganization of its government, in the case of Bulgaria it was stated that Russia alone should give "friendly advice" on the desirability of broadening the government, but that when the government had been made more representative it would be recognized by Great Britain and the United States.

Russian influence was also instrumental in healing the schism between the autocephalous Church of Bulgaria under an Exarch and the Ecumenical Patriarchate of Constantinople, which had subsisted since 1872. The ending of the schism was announced by the Ecumenical Patriarch Benjamin on Feb. 22 and was widely celebrated. Russian interest was interpreted as part of a Russian scheme to bring all the Orthodox Churches into a closer union and under Russian patronage, so that they might somehow promote Russian interests, if only as a moral counterpoise to Roman Catholicism. More specifically it was thought that Russia contemplated a solution of the Straits question by the creation of an ecclesiastical state under the Ecumenical Patriarchate. Bulgaria would be directly interested in such a development, and much interest was shown in the question of the election of a successor to Benjamin, who died in November.

Production. Agriculture is the most important occupation of the people—the chief products being cereals, potatoes, tobacco, rose oil, cotton, beet sugar, and grapes. Livestock (1934): 1,497,624 cattle, 913,088 goats, 901,976 pigs, 531,519 horses, and 12,772,740 poultry. The output of raw silk in 1943 amounted to 159 metric tons. Mineral products include coal, lignite, cement, and salt.

Finance. Budget estimates (1944): 25,331 million leva (21,716 million leva in 1943). The total public debt on Sept. 1, 1943, was estimated at 53,000 million leva.

Foreign Trade. In 1942, including bullion and specie, imports were valued at 12,929,000,000 leva; exports, 13,418,000,000 leva. For the period Jan. 1 to Aug. 31, 1943, imports were valued at 9,863,000,000 leva, and exports at 10,185,000,000. The main exports were tobacco, fruit, eggs, wheat, hides, and wine.

BURMA. A British dependency in southeastern Asia with an area of 261,610 square miles, comprising Burma proper, the Chin and Kachin Hills tracts, Shan States and unadministered territory. Burma was separated from India in 1937 and given its own constitution and government. Before the Japanese occupation in 1942 the executive power was vested in the Governor (appointed by the British crown) who was advised by a council of ministers of not more than 10 members. The Governor had control over foreign affairs. Domestic affairs were administered by a Burmese ministry, responsible to a Burmese legislature consisting of a Senate of 36 members (18 elected by the House of Representatives and 18 appointed by the Governor) and a House of Representatives of 132 elected members. Large areas in the northern and eastern hill districts were excluded from the legislature's control and placed under the jurisdiction of the Governor. Upon the Japanese invasion, the British Governor, the Burmese Premier, and certain other Burmese officials set up headquarters at Simla, India. A few British officials of the Burma Government remained in charge of unoccupied districts of northern Burma.

On Aug. 1, 1942, the Japanese instituted a form of government made up of a joint Burmese and Japanese administration under the nominal leadership of U Ba Maw, a former Premier of Burma. Under this arrangement the Burmese Parliament disappeared. The supreme power rested with the Japanese commander in chief. With the defeat of the Japanese Burma returned to its former status and it was announced by the Burma Office on Oct. 8, 1945 that Sir Reginald Dorman-Smith, Governor of Burma, who was to complete five years' tenure of office on May 5, 1946, would hold office for a further year from that date.

Events, 1945. After the fall of Rangoon on May 3 the final collapse of the Japanese came swiftly. The reorganization of the Burmese Government was initiated on May 17 with the publication of a British White Paper emphasizing the intention of His Majesty's Government to assist Burma "to attain a status equal to that of the Dominions and this country." It was affirmed that until a general election could be held it was not possible to re-establish a Burmese government as it existed in 1941, and that the existing system of administration by the Governor in direct responsibility to the British Government would therefore be prolonged for three years more; that is, until Dec. 9, 1948.

The early establishment of an executive council, in which official and ultimately unofficial Burmans would be included, was envisaged in the White Paper. Anticipated later steps included the return to prewar status, the holding of a general election, improvement of the economic and financial position of the country, the drafting of a constitution by Burmans and the endorsement by the British Parliament of full dominion status. The scheduled areas (the Shan states and the tribal areas in the mountainous fringes of the country) were expected to be under a special regime until a suitable form of amalgamation with Burma proper, one acceptable to the inhabitants of the scheduled areas, should be devised.

The process outlined seemed to many Burmans, particularly those connected with the young and energetic nationalist movement, so uninspired in presentation and so prolonged in execution that they were inclined to question even the sincerity of the British Government in offering the plan. A memorandum issued late in May by the Burma Association representing Burmese nationals

resident in Britain demanded greater speed, a definite date for dominion status, an amnesty for collaborationists, and Britain's assumption of rehabilitation costs. The second reading of the bill to provide for the temporary extension of the existing Government gave the British Parliament on June 1 the double opportunity to discuss the White Paper and to assure Burmans of British sincerity and friendliness.

The Governor of Burma, Sir Reginald Dorman-Smith, arrived in Rangoon on June 19 and began conferences with Burmese leaders on board a British warship in the harbor. These leaders included representatives of the A.F.O. or Anti-Fascist Organization, the only political force to be reckoned with in Burma at this time, and the B.I.A. (Burma Independence Army), the armed section of a wider movement which was backed by the A.F.O. This movement, which had hoped for full independence under the Japanese, changed sides when their demands were not fulfilled and when Japanese defeat became certain. In June the Governor could not give the date for reestablishment of civil government in Burma. On Sept. 14 Japanese envoys signed a formal surrender at Rangoon.

Re-establishment of Civil Government. Sir Reginald Dorman-Smith returned to Rangoon on Oct. 16 and immediately took over from the military the general administration of Burma, including the judiciary. On that day the Governor's flag was hoisted at Government House for the first time since Feb. 22, 1942. The political leaders who declined to join in the official welcome included Major-General Aung San, chief of the B.I.A. and Thakin Than Tun, head of the Communist Party. The organizations represented were in control of the Anti-Fascist People's Freedom League, as the A.F.O. was now called, and withheld official participation lest the action commit them to approval of forthcoming offers from the Governor.

The King's message to the people of Burma defining the British Government's policy in respect to their country was read by the Governor on Oct. 17 at the City Hall. The message and the Governor's subsequent speech restated the British Government's purpose of developing dominion status for the first liberated territory to be re-entered effectively by the power formerly responsible for its control. Six days later the Freedom League's supreme council defined its attitude towards the proposed executive council by setting stiff conditions. It would participate only if the Governor accepted from its lists 11 of the 15 members and granted those members the right to allocate portfolios among themselves. Secondly, there should be universal suffrage for the general election, which should be for a constituent assembly and not for a new legislature as under the existing constitution. Subsequent discussions between the Governor and the representatives of the Freedom League broke down without agreement on these and related points. Members of the executive council appointed in November included U Tharrawaddy Maung Maung, former Minister of Education and Minister for Health and Public Works.

Economic Problems. The economic rehabilitation of Burma, which appeared to have suffered more from the ravages of war than any member of the British Commonwealth in the East, was scarcely begun when the year ended. Plans had been made and work started in the reconstruction of agriculture and forestry but industry was uncertain even of its status. Industrialists, both British and Bur-

mese, were pressing to have the question of responsibilities for war losses settled, and the latter were insistent that there be no discrimination with respect to nationality. Burma, the world's greatest prewar exporter of rice, was handicapped in the production and distribution of this commodity, especially in upper Burma, by shortage of cattle for ploughing, transportation difficulties and the currency situation. The driving out of the Japanese currency proved more difficult than had been anticipated, especially in rural regions where that currency had won acceptance and the new British substitute was unwelcome. While the political situation in Burma continued to demand official tact, economic problems called for expert assistance as well as for the former quality.

The Population. At the census of March 5, 1941, the population was 16,824,000. At least two-thirds of the people, most of whom live in rural districts, are of Burmese origin. In the extremely diversified population there are three other large groups: Tibeto-Burman, Mon-Khmer and Tai-Chinese.

The standard of education remains low, with only one-half of the male and 14 per cent of the female population literate. More than 84 per cent of the people are Buddhists. Nearly all of the rest belong to Animist, Mohammedan, Hindu or Christian sects.

Trade and Transportation. Imports in 1940 were valued at 270,350,000 rupees (rupee averaged \$0.30 for 1941) and exports at 531,120,000 rupees. India supplied 63 per cent of the imports and took 52 per cent of the exports (mostly rice). United States exports to Burma rose from \$1,765,000 in the first 9 months of 1938 to \$13,310,015 for the corresponding period in 1941. The Japanese conquest in May, 1942, ended all trade with non-Japanese areas and cut off the large transit trade to China via the Burma Road.

The Burma Road, opened in January, 1939 from the railhead at Lashio in northern Burma to Kuming, China, was Free China's principal trade route until it was blocked by the Japanese capture of Rangoon in February, 1942. A new road linking Assam, India, with the Burma Road was constructed by United States forces in 1943-1944. Normally economic life centers around the Irrawaddy and other great rivers which offer the principal means of transportation and communication.

ALZADA COMSTOCK.

BUSINESS REVIEW. American business went through three main phases in 1945. During the first four months of the year, nearly half the nation's production of goods and services was for war purposes, to supply the vast armed forces that were fighting in Europe and the Far East. Following V-E Day, war production declined gradually and some preparations were made for reconversion. However, munitions requirements were still so great that most of the controls imposed upon business by the Government during the two-war period had to be retained. After V-J Day, however, wholesale cancellation of government contracts and the removal of controls permitted industry to concentrate upon rapid reconversion of facilities to consumer goods production. Reconversion preparations were largely completed by the end of the year, but major labor disputes prevented volume output of the many consumer durable goods that were in urgent demand because of cessation of their production during the war.

The gross national product, or aggregate value of all goods and services produced in the United

States, was estimated at \$194,000,000,000 for the year. This compared with \$198,700,000,000 in 1944. During the first half of the year, the gross national product was at a record rate of \$208,000,000,000, of which 49 percent was purchased by the Government. In the second half of the year, gross national product declined to an annual rate estimated at \$182,000,000,000, of which the Government absorbed less than 40 percent.

The sharp decline in government spending during the latter part of the year was offset in part by an expansion in consumer expenditures. By the end of the year, production for the civilian market was officially estimated at \$20,000,000,000 a year more than on V-J Day.

Production for War. Orders for munitions had been increased by the armed forces following the German offensive in Belgium and Luxembourg in December, 1944. During the early months of 1945, strenuous efforts were made to expand the output of such critical items as mortars, navy rockets, aircraft, and radar equipment. That these moves were attended with great success was demonstrated by the fact that the output of mortars in February, 1945, was three times as large as in September, 1944, while increases of well over 100 percent were registered in production of navy rockets and aircraft. The index of munitions production, which stood at 105 in December, 1944, reached 109 in March, 1945, which was the peak for the year.

Following V-E Day, moderate cutbacks were made in war orders. These were smaller than had been originally anticipated, however, so that munitions output for the three months May-July, 1945, was only 9 percent below that of the first four months of the year. Furthermore, a sharp increase was ordered in incendiary bomb production as the aerial assault upon Japan was stepped up. By V-J Day, outstanding Government contracts for munitions still aggregated some \$40,000,000,000.

Following V-J Day, however, wholesale cancellations of munitions contracts came promptly, and the war production program was liquidated with great rapidity. Within forty-five days after Japan's surrender, 122,000 contracts with a value of \$25,000,000,000 were terminated. By the end of the year, around \$13,000,000,000 of contracts, many of them for naval facilities requiring a long period of construction, were still outstanding. Munitions procurement in 1946 is scheduled at only \$3,500,000,000, as compared with aggregate munitions purchases of \$36,300,000,000 effected during 1945.

The settlement of cancelled war contracts under the provisions of the Contract Settlement Act of 1944 was effected smoothly and rapidly. Out of 300,000 prime contracts terminated since the war began, some 240,000 had been settled by the end of 1945. Claims to be paid against remaining terminated contracts were estimated officially at only \$3,500,000,000, and contractors had already received two-thirds of this sum in the form of advance payments, partial payments or termination loans. Furthermore, the Government virtually completed the job of clearing war machinery and inventories out of privately-owned plants within the sixty day limit following contract termination specified in the Contract Settlement Act.

Removal of War Controls. When the war ended, the Administration was under pressure from business and other groups to remove controls as soon as possible, in order to hasten resumption of civilian production. On the other hand, there was pressure from labor and some other quarters to main-

tain controls in order to prevent erratic changes in the price level and other phases of the economy. The Truman Administration favored a policy of rapid removal of most controls, particularly those applicable to the production and distribution of goods, going so far in this direction that a reversal of policy as regards building materials was necessary late in the year, and some controls were reimposed.

The War Production Board was particularly prompt in removing controls. At the peak, it operated the Controlled Materials Plan and had outstanding some 650 orders affecting production, materials distribution, inventories, etc. When WPB went out of existence on Nov. 3, by order of the President, the Controlled Materials Plan was replaced by three priority regulations designed to assure raw materials for main government needs and the most urgent civilian requirements, and only 52 orders remained in effect. A large number of these concerned textiles, supplies of which remained inadequate because of a critical labor shortage. The Civilian Production Administration succeeded the War Production Board on November 3.

The Office of Price Administration ended all rationing programs following V-J Day, except sugar, and removed price ceilings from several thousand items, most of them of minor importance, supplies of which were adequate or which did not affect the cost of living materially. The Office of Defense Transportation abandoned the great bulk of its wartime regulations at the same time.

Surplus Disposal. Disposal by the Government of huge surpluses of equipment, supplies and materials left on its hands at the end of the war is a major factor affecting many industries. These surpluses equal a considerable portion of current requirements of some commodities, and their liquidation would have marked effects upon the availability of goods and upon prices. This task has been described as "the largest merchandising job ever undertaken anywhere. Actual liquidation of government-owned surpluses was limited during 1945, as the machinery for accomplishing this task was still largely in the formative stage. At the close of the year, the inventory of surplus production awaiting disposal approximated \$10,000,000,000, based on cost. More than one-third of this represented unsalable aircraft, the bulk of which was to be scrapped. It was expected that another \$40,000,000,000 of goods and property, valued at cost, will be declared surplus in 1946 and 1947.

The President turned over the task of surplus disposal for the most part to the Reconstruction Finance Corporation, by an Executive Order issued in October, and the War Assets Corporation was made a subsidiary of the RFC to undertake this function. A nation-wide network of offices was established by the War Assets Corporation, and the intensive commercial selling methods developed by private enterprise were applied in pushing surplus sales.

Reconversion Problems. While prompt, drastic cutbacks in war production and the rapid removal of wartime controls greatly facilitated the reconversion of industry to consumer goods manufacture, a number of bottlenecks were encountered by business. Many important raw materials and finished goods remained in short supply. Lumber, tin, lead, copper, textiles and various types of heavy equipment were not readily available. Manufacturers of consumer durable goods, the demand for which was particularly keen, could not obtain some of the component parts required to fabricate their

products. Residential construction, urgently required in large volume to relieve the worst housing shortage in the nation's history, was held back by lack of lumber, brick, soil pipe, and gypsum lath.

These materials shortages were in part due to the shortage of labor in some communities and industries. Despite the fact that 5,400,000 men and women were discharged from the armed services in the four months following Japan's surrender, many manufacturers could not secure sufficient labor, especially when overtime was largely eliminated because they could not afford to pay time and a half and yet sell civilian goods within OPA ceiling levels at a profit. While wartime controls over manpower were lifted on V-J Day and the War Manpower Commission was abolished shortly thereafter, the United States Employment Service, which was made a part of the Department of Labor, sought to encourage the flow of workers into consumer goods industries where shortages were severe. The Employment Service handled the largest number of applicants in its history. However, many persons released from the armed forces did not look for work immediately, workers discharged from war plants took vacations in many cases, and numerous women and older persons who had been working during the war withdrew quickly from the labor force as households were reestablished on a prewar basis. Industries where wages were relatively low faced a special problem, in that workers accustomed to high wartime rates of pay refrained from returning to jobs in these lines.

The virtual removal of wage controls four days after Japan's surrender brought sweeping wage increase demands from labor. In many instances, these demands were granted, but in other cases employers refused to agree to sharp wage advances on the ground that price ceilings did not permit them to pay out so much more in wages, or because the demands were not justified by prevailing wage scales paid in other industries. A number of major strikes resulted, the most serious of which was the walkout of General Motors Corporation employees during the final weeks of the year. These strikes offset in part the speed with which industry had reconverted its plants, so that actual production of automobiles and other important consumer durable goods fell far short of projected schedules of output.

Durable Goods Industries. Durable goods industries were most affected by the drastic decline in war production during the latter half of 1945. Output of durable manufactures declined by over 40 per cent, although a slight upturn was registered in the closing weeks of the year. Minerals production declined also, but to a lesser degree.

The drop in durable goods output was to a large extent temporary, however. Shortages of consumer goods were mainly in the durable goods field. Hence, the decline reflected the time required to shift from war to peacetime production in these industries.

Indices of mineral production for December, 1944, and December, 1945, compared as follows:

MINERAL PRODUCTION
(1935-39 average = 100)

	1944	1945
Bituminous coal.....	138	142
Anthracite coal.....	109	94
Crude petroleum.....	146	140
Metals other than gold and silver	108	102
Minerals—Total.....	137	134

The demand for many metals is expected to outrun domestic production during the next few years. In that event, the United States will have to rely to a greater extent upon imports, although sales of Government-owned surpluses may help to satisfy the demand. Proposals for maintaining a huge Government stockpile of strategic metals could make supplies less plentiful and tend to lift prices, once price controls are relaxed.

Automobile production in 1945 was negligible, falling far below early estimates that over 500,000 cars could be turned out. Actual production for the year was 83,792 passenger cars. While shortages of some materials and parts were a factor, labor difficulties, and particularly the General Motors strike, were chiefly responsible. Truck production, which involved far fewer reconversion problems, recovered sharply, light truck output rising to over 50 percent of the prewar level. Civilian truck production, which aggregated only 15,853 in December, 1944, rose to 53,103 in November, before it was cut by strikes.

Indices of durable goods manufactures, as compiled by the Board of Governors of the Federal Reserve System, compared as follows for December, 1944, and December, 1945:

DURABLE GOODS PRODUCTION
(1935-39 average = 100)

	1944	1945
Iron and steel	198	165
Machinery	431	234
Automobiles	235	92
Lumber	111	85
Furniture	142	131
Plate glass	51	3
Glass containers	218	244
Cement	90	119
Clay products	116	125
Gypsum and plaster products	171	185
Abrasive and asbestos products	307	215
Durable Manufactures—Total	343	187

Non-durable Consumer Goods. Since output of non-durable consumer goods was fairly well sustained during the war, this part of the economy was less affected by the cessation of hostilities.

NON-DURABLE GOODS PRODUCTION
(1935-39 average = 100)

	1944	1945
Textile fabrics	141	132
Cotton consumption	146	125
Rayon deliveries	215	228
Carpet wool consumption	57	104
Apparel wool consumption	215	184
Woolen and worsted cloth	166	154
Leather tanning	115	114
Shoes	113	108
Wheat flour	123	134
Butter	78	60
Cheese	154	144
Canned and dried milk	179	136
Meat packing	158	155
Pork and lard	164	171
Beef	149	138
Veal	175	138
Lamb and mutton	149	148
Processed fruits and vegetables	146	123
Confectionery	138	113
Alcoholic beverages	169	212
Cigars	95	87
Cigarettes	155	139
Pulp	150	137
Paper	129	131
Printing and publishing	104	112
Gasoline	141	144
Coke	167	145
Paints	141	126
Soap	137	244
Rayon	242	373
Industrial chemicals	396	197
Rubber products	239	204
Non-durable Manufactures—Total	173	156

Textile production, however, was seriously hampered by a shortage of labor which was probably exaggerated by the fact that wage scales in the industry, although increased sharply during the war years, remain lower than in a number of other fields. Unwillingness of OPA to permit more than selective and small price increases, and efforts of that agency to force increased output of low-priced goods, were also blamed by the trade for the persistence of the shortage of textile products. Depletion of retailer inventories during the war, the need by veterans for civilian clothes and urgent relief requirements for textiles in Europe intensified the shortage.

Production of non-durable manufactures in December, 1944 compared with December, 1945, is shown in table.

Retail Trade. Expenditures upon consumer goods and services during 1945 were estimated by the Department of Commerce at \$100,800,000,000, as compared with \$97,600,000,000 in 1944. This was a new high record, but even larger totals were expected for postwar years as consumers finally obtain the durable goods they could not buy during the war. Contrary to the usual pattern, retail trade rose despite the decline in consumer incomes. This was due to the fact that consumers saved a very much larger part of their incomes during the war than is normally the case. These savings were, to a large extent, forced or involuntary, and reflected the lack of goods.

The purchasing power received by major groups of the population during the year is reflected in statistics of income payments to individuals as follows:

INCOME PAYMENTS TO INDIVIDUALS
(Billions of dollars)

	1944	1945
Salaries and wages	112	110.2
Other labor income	5.8	8.6
Entrepreneurial income and net rents	28	30.
Interest and dividends	11.2	12.2
Total income payments	157	161

Sales of all retail stores for the year were estimated at \$74,400,000,000 by the Department of Commerce, which compared with \$69,500,000,000 in 1944. The retail price index rose from 139.6 in December, 1944 to 142.2 in the final month of 1945.

Department store sales reflected the further rise in trade volume during the year. Indices for both sales and inventories for each month of 1945, with comparisons for 1944, follow:

DEPARTMENT STORE SALES AND INVENTORIES
(1935-39 average = 100)

	Sales		Inventories	
	1944	1945	1944	1945

Commodity Prices. The index of wholesale prices compiled by the Department of Labor increased by little more than 2 percent during 1945. While this index rose to the highest level since 1920, its

apparent relative stability for the year did not reflect the enormous pressures to lift the price level that were at work. The nation's money supply had been tripled during the war, and the national income had doubled. The supply of consumer goods and services, which could not be increased during the war because of preoccupation with munitions production, could be increased only gradually even after the war was over because of the reconversion bottlenecks and the labor troubles described above. Hence, conditions were similar to, and even more explosive than, those that caused a runaway rise in commodity prices in 1919 and 1920, followed by an even more drastic deflation late in 1920 and 1921, when supplies of goods finally caught up with the demand.

Recognizing this situation, the Administration retained the bulk of price controls. It also called on Congress to extend the life of the Emergency Price Control Act beyond June 30, 1946, but this request had not been acted upon by the end of the year.

Pressures to raise prices came from various sources. The farm bloc in Congress sought higher prices for agricultural products through recomputation of parity levels and in other ways. Many industries and individual corporations asked for higher price ceilings, on the ground that their costs had risen. The greatest single pressure came, however, from the wage increase demands of organized labor. The intimate relation that exists between wage costs and prices became increasingly evident. The President's Executive Order 9599, issued four days after V-J Day, limited wage increases to those that would not lead to price increases. But pressure for wage increases became so great that the President issued his Executive Order 9651 on October 30, specifying that price relief shall be given industries that grant wage increases, where found necessary after a six months' trial period.

Wholesale prices of major commodity groups compared as follows in December, 1944, and December, 1945:

WHOLESALE COMMODITY PRICES
(1926 = 100)

	1944	1945
Farm products	125.5	131.5
Foods	105.5	108.6
Building materials	116.4	119.5
Chemicals and allied products	94.8	96.1
Fuel and lighting materials	83.1	84.8
Hides and leather products	117.4	118.9
Housefurnishing goods	104.4	104.7
Metals and metal products	103.8	105.6
Textile products	99.5	101.4

Actual prices of important commodities at the end of the year compared as shown below.

The cost of living index of the United States Department of Labor, like the index of wholesale commodity prices, rose only about 2 percent during the year. The Office of Price Administration concentrated upon maintaining controls on all cost of living items, recognizing that this index plays a larger part in wage negotiations than any other single factor. Thus, price ceilings for citrus fruits, which had been suspended because of the bumper 1945 crop, were quickly re-imposed in December when it became apparent that retail prices were being marked up above the old ceilings by retailers. Citrus fruits constitute a material part of the food item in the official cost of living index.

Business Profits. Corporate profits after taxes for 1945 aggregated \$9,000,000,000 as compared with

* Only products without ceilings are potatoes, cotton and raw silk.

\$10,000,000,000 in 1944. Despite the impact of cancellation of war contracts, deductions on account of accelerated amortization of defense facilities and reconversion expenses, net earnings were surprisingly well sustained. This was due chiefly to the reduction in corporate taxes, particularly excess profits taxes, reflecting smaller profits before taxes. Federal income and excess profits taxes on corporations were estimated at \$13,000,000,000 in 1945, as compared with some \$15,000,000,000 in 1944. Profits of large corporations in a number of major industries for 1944 and 1945, as compiled by the National City Bank, compared as follows:

EARNINGS OF MANUFACTURING COMPANIES
(In thousands)

No. of Cos.	Industrial Groups	1944	1945
17	Baking	\$ 23,697	\$ 25,305
14	Meat packing	46,236	34,307

745	Total manufacturing	\$1,173,326	\$1,153,409

Foreign Trade. A major development in foreign trade during the year was the cancellation of Lend-Lease immediately after V-J Day. The result was a sharp decline in exports, although by the end of the year commercial exports were rising gradually. The demand for American goods was extremely

keen, owing to the wholesale destruction abroad during the war, the severe curtailment of productive capacity of many important countries and huge requirements for immediate relief.

Numerous government controls and special arrangements affecting foreign trade were terminated following the end of the war. By the end of 1945, only 15 percent of the commodities that had been under export license control, and 25 percent of those that had been under import control, were still under such regulation. The Combined Raw Materials Board and the Combined Production and Resources Board that had been set up during the war to coordinate import purchases by the United States and British Empire countries ceased to exist on Dec. 31, 1945, and were succeeded by committees composed of representatives of the principal producing and consuming nations to supervise trade in rubber, tin, hides, skins and leather, textiles, and coal.

Export controls that remained at the end of the year covered such items as foods, cotton textiles, hides and leather, rubber products and fertilizers. The items subject to import control, and for the most part to price controls also, were rubber, cattle hides, molasses, rotenone, and hard fibers such as sisal.

Business men planned aggressively for a vast increase in export sales, particularly of capital goods, in view of the urgent reconstructive needs and the funds to be advanced foreign buyers to pay for their purchases, by the Export-Import Bank, the International Bank for Reconstruction and Development, and, in the case of Great Britain, directly by the U. S. Government.

JULES I. BOGEN.

CANADA. A dominion of the British Commonwealth of Nations, comprising nine provinces and two territories, with a land area of 3,695,189 square miles. Capital, Ottawa.

Government. Executive power is exercised in the King's name by the Governor General of Canada, acting through a responsible ministry. Legislative power rests in a Parliament of two houses: a Senate of 96 members appointed for life by the Governor-General on advice of the Cabinet and a House of Commons of 245 members elected for five years (unless the government is sooner dissolved) by popular male and female suffrage. The nine provinces enjoy a large measure of local autonomy, with a separate parliament and administration for each. A lieutenant-governor (appointed by the Governor-General-in-Council) heads each provincial executive. Governor-General in 1944, the Earl of Athlone, to be succeeded in the spring of 1946 by Field Marshal Sir Harold Alexander, appointed Aug. 1, 1945.

The Liberal Government sworn in Oct. 23, 1935, was constituted as follows on Sept. 1, 1945: William Lyon Mackenzie King, Prime Minister, President of the Privy Council, Secretary of State for External Affairs; James A. Glen, Minister of Mines and Resources; James H. King, Minister Without Portfolio; Ian Alistair Mackenzie, Minister of Veterans' Affairs; James L. Ilsley, Finance; Lionel Chevrier, Transport; Clarence D. Howe, Reconstruction and Supply; James G. Gardner, Agriculture; Paul Martin, Secretary of State; James A. MacKinnon, Trade and Commerce; Ernest Bertrand, Postmaster General; Dr. J. J. McCann, National Revenue; Douglas C. Abbott, Defense and the Navy; Louis S. St. Laurent, Justice and Attorney General; Humphrey Mitchell, Labor; Alphonse Fournier, Public Works; H. Francis G.

Bridges, Fisheries; Brooke Claxton, National Health and Welfare; Colin Gibson, National Defense for Air; Joseph Jean, Solicitor General; Dr. J. J. McCann, National War Services (ministry to be discontinued).

Events, 1945. In spite of the relief which the end of the war brought to Canada, the immediate necessity of reshaping the life of the country on a peacetime basis and the emergencies of a national election, Canada's outlook in 1945 was more thoroughly international than for many years. The country's representatives participated actively in the British Commonwealth Conference, the San Francisco Conference, the United Nations Relief and Rehabilitation Administration council meeting and the United Nations Executive Committee and Preparatory Commission sessions. Parliament ratified the Bretton Woods Agreements and by extending foreign credits for postwar trade at the same stroke fortified the country's economy and treated other countries generously.

When one of Canada's longest Parliaments ended on Apr. 16, thus freeing members to attend the San Francisco Conference and to participate in the national election, peace in Europe had not yet come and the tasks of reconversion, in anticipation of which Canada's vast reconstruction program had been shaped in 1944 (see 1945 YEAR BOOK, pp. 101-2), were not yet known to be at hand. In the succeeding Parliament, which opened on Sept. 6, the reconversion program was further developed. The Veterans' Land Act amending bill, making changes in the Act passed in 1942, increased the scope of settlement opportunities and provided that acceptance of the benefits of the act should not disqualify a veteran from taking a seat in Parliament.

General Election. The general election on June 11 which returned Liberal Prime Minister W. L. Mackenzie King and his party to power was preceded by a lively three-sided campaign. The Progressive Conservative party, the opposition, was led by John Bracken, former Prime Minister of Manitoba, who offered a "national policy" which included opposition to concentration of power in Ottawa and new tax policies for the stimulation of business. Speaking in Calgary on May 26 at a political rally Bracken accused Prime Minister King of permitting Canada's foreign policy to be dictated from abroad and being "now determined to transfer our foreign policy from Ottawa to Washington."

The Cooperative Commonwealth Federation carried on a sufficiently energetic campaign to cause some anxiety for the two older parties. M. J. Coldwell, the C.C.F. leader, who was a member of the Canadian all-party delegation to the United Nations Conference at San Francisco, set forth the party program in a radio address from that city on May 18. The program included full employment, increased farm prices, social ownership and control of giant monopolies and planned trade. Coldwell spoke at this time of the disturbing report that a "flood of vicious propaganda" against the C.C.F. was coming from "big corporate and financial interests" in Toronto.

Prime Minister King based his campaign upon the Liberal Party's war record, upon its performance and intentions in the field of social reform and upon the maintenance of Canada's status as a country influential in international affairs. The achievements at San Francisco of the Canadian delegation led by King appeared to reinforce the Liberal claim to leadership in foreign relations.

The election scene was enlivened by the efforts of minor groups, including the Social Credit Party

and the Bloc Populaire, representing the national and youthful elements among French-Canadian voters, which was opposed to international and social democratic programs, in particular those sponsored by the C.C.F. A short-lived organization, the National Front Party, was announced on Apr. 27 by P. J. A. Cardin, former Liberal member of the House of Commons who resigned in 1942 as an opponent of conscription, as contesting seats in the general election. Cardin announced the dissolution of this party on May 8. The Labor Progressives were active in eastern industrial districts and were subsequently involved in Coldwell's accusation that his defeat was due in part to "confusion deliberately created . . . in the interests of the Liberal Party by Communists under the guise of Labor-Progressives."

Canadian servicemen and women overseas began voting on May 28 but the count of their vote could not be completed until after the election on June 11. The result of the civilian voting for the 245 seats in the House of Commons was: Liberal, 118; Progressive-Conservative, 66; C.C.F., 26; Social Credit, 13; and the remainder scattered. One of the curiosities of the election was King's loss of his own constituency at Prince Albert, Saskatchewan. He was later elected by Glengarry in eastern Ontario. In the overseas service voting the Liberal Party topped its opponents, but the C.C.F. took a high second place and the Progressive-Conservatives were shunted into a poor third.

Provincial Elections. The liveliest of the provincial elections in 1945 was that in Ontario on June 4, when Progressive-Conservative John Drew was returned to office with 66 seats out of 90. The Liberals and the C.C.F. won only 11 and 6 seats respectively, although in the preceding legislature their combined strength controlled the body. The C.C.F. was the official opposition in Ontario before this election. Progressive-Conservatives promptly but mistakenly found in the returns a sign of victory in the national election to be held a week later, but later found the Ontario returns merely a sign of changing sentiment in the province itself, particularly in industrial areas.

In the Manitoba election on Oct. 15 the Conservative Government, with Premier Stuart S. Carson at its head, was reelected. The C.C.F. increased the number of seats held to 8, plus an independent C.C.F. member, compared with three in the preceding House. In Nova Scotia on Oct. 23 the Liberals had an almost clean sweep, with the winning of 28 out of 30 seats, the elimination of the Progressive-Conservatives from the Legislature and the reduction of C.C.F. seats from three to two. In British Columbia provincial elections on Oct. 25 the Coalition Government was reelected by a wide margin.

San Francisco Conference. Canada's active interest in the United Nations Organization was shown in March in a 10-day debate on foreign policy as related to the San Francisco Conference. Prime Minister King announced early in the month that he would include representatives of the opposition in the Canadian delegation, a statement which was well received as a promise of the first wartime step to have political opponents of the Liberal Government share Government responsibility. The debate, which filled the first days of the final session of Canada's 19th Parliament (Mar. 18-Apr. 16), concluded with the passage by a vote of 202 to 5 of a motion to authorize Canada's participation in the Conference. The five opponents were members of the Quebec anti-conscription bloc.

Before the session opened King paid a brief visit

to President Roosevelt in Washington for discussion of the Yalta agreements and the San Francisco plans. Representatives of the Dominions met in London on Apr. 4 for a conference on the same group of subjects, with special reference to the Canadian contention that the middle powers, presumably led by Canada, and the small powers should have a voice in decisions involving the use of force or sanctions. King, who consistently stood for independence of action for Canada, reiterated his position in the closing house of the March debate in the Canadian Parliament, when he expressed his disapproval of any plan for a unified role for the British Commonwealth.

The Canadian delegation to San Francisco, named by Prime Minister King on Apr. 9, consisted of 7 members: King as leader of the delegation; Minister of Justice L. S. St. Laurent; Dr. J. H. King, Government leader in the Senate; Mrs. Cora Casselman, Liberal member of the House for Edmonton East; Gordon Graydon, Progressive-Conservative House leader; Senator Lucien Morau, Progressive-Conservative from Quebec; and M. J. Coldwell, C.C.F. leader. It was evident that Canada's relations with Latin America were receiving attention, for the Prime Minister announced that the Ambassador to Chile, Warwick F. Chipman, and the Ambassador to Brazil, Jean Desy, would accompany the delegation.

Because of the coming national election several of the Canadian delegates could not remain until the end of the conference, which lasted from Apr. 25 to June 26. Prime Minister King was present at the time of the admission of Argentina on Apr. 30, a step for which he voted the delegation's approval but which was later denounced by C.C.F. leader M. J. Coldwell. King left on May 14 and Graydon, Coldwell and Mrs. Casselman shortly thereafter. The Dominion was elected one of the 14 nations on the conference's executive committee, a position which later assured her a place on the UNO executive committee and the Preparatory Commission, both of which met in London later in the year.

The Canadian delegation's amendments to the Dumbarton Oaks proposals were well received, and late in May Canada was the leader in forcing the acceptance of the principle that when the question of using a country's armed forces is involved that country should have a right to vote on the matter in the Security Council. Canada was also a leader in demanding an enlarged place in the United Nations Organization to the Economic and Social Council.

Dominion-Provincial Conference. The Prime Minister's decision to convene a Dominion-Provincial Conference in Ottawa on Aug. 6 reflected the necessity of devising new financial and jurisdictional relations between the Federal Government and the provinces. A broad agenda was provided covering financial, reconstruction and social security issues, and it was announced that the August meeting would be preliminary only, after which adjournment would be taken in order to give time for the careful consideration of the questions raised.

As a war measure the Dominion took over personal income and corporation taxes from the provinces and paid them cash grants in return. The meeting of the provincial prime ministers was called at Ottawa in order to reorganize the system on a peacetime basis. The talks ended on Aug. 10, after the Dominion Government had presented its proposals, with some of the provinces reserving their counter-proposals until further study could be made. Sessions were resumed in the last four days of November and then adjourned until early in

1946. The economic committee of the conference met in Ottawa in the first part of December. The Dominion proposals were more generous than had been anticipated, but the provinces were naturally reluctant in time of peace to yield to the Federal Government powers that they had formerly exercised.

The Prime Minister Abroad. Prime Minister King's visit to President Roosevelt in March took place a little more than a month before the President's death on Apr. 12. King paid a tribute to the late President in the House of Commons on that evening and the House then adjourned for the night sitting. Memorial services were held throughout Canada in the succeeding days. King announced on June 2 that he had been invited by President Harry S. Truman to "continue at the White House the informal talks which in the past have done so much toward creating the warm friendship and close understanding between our two countries."

The Prime Minister told the House of Commons on Sept. 27 that he proposed to start within a few days on an extended tour to include the United States, Britain and western Europe. King was in Washington for conversations with President Truman on Sept. 30, after which he sailed for England. The Canadian Prime Minister's talks with British Prime Minister Attlee and his subsequent travels were on an informal basis, but on Nov. 11 King and Attlee were again in Washington to confer with President Truman on the Anglo-Canadian proposal for internationalization of atomic energy. After 5 days in conference the three leaders joined in expressing their willingness to share reciprocally with other United Nations details on the practical application of atomic energy "just as soon as effective enforceable safeguards against its use for destructive purposes can be devised." On Nov. 16 King and Attlee left together for Ottawa, where the British Prime Minister addressed the members of both houses in the House of Commons on Nov. 19.

Foreign Economic Relations. The end of the war brought to Canada the realization that energetic steps must be taken if the country was to retain the very high place in foreign trade which she had held in the period of hostilities. Canada now had a higher per capita foreign trade than any other country, with the result that her industries and level of employment had become peculiarly susceptible to fluctuations in international commerce. Canada's Mutual Aid scheme, whose cumulative value up to the end of hostilities against Japan was about \$2,400,000,000 (a large part of which was a gift to Britain) ended with the signing by Japan of surrender terms on Sept. 2, according to a statement in the House of Commons on Sept. 7 by Finance Minister J. L. Ilsley.

The Finance Minister assured the House that the termination of mutual aid would not interrupt or delay the flow of essential civilian supplies to Allied nations. Britain would have no difficulty in the immediate future getting funds for making Canadian purchases, for she would have income from Canadian forces overseas and also from the settlement of past transactions. Later Britain and the other members of the sterling area must have separate consideration. Many countries outside the sterling area would need assistance in buying from Canada. The groundwork for such aid was given by export credits, for which negotiations were pending.

Canadian exporters were given protection by the Export Credits Insurance Act passed by Parliament in 1944. The Export Credits Insurance Cor-

poration, for which the act provided, opened for business at the beginning of September. It was empowered to issue contracts of insurance up to a total of \$100,000,000 covering exporters against the main risks of loss not normally covered by commercial insurers, such as the insolvency of the foreign buyer or his protracted default.

Finance Minister Ilsley introduced in the House of Commons on Dec. 3 a bill to increase the amount of loans to be made under the Export Credits Act from \$100,000,000 to \$750,000,000. France was scheduled to get the largest credit, \$242,500,000; the Netherlands was to have \$85,000,000; Norway \$30,000,000; and the Bank of the Netherlands Indies \$65,000,000. At this time negotiations were going on with the Soviet Union, to whom \$3,000,000 was already granted, and with China, and it was expected that Belgium and India would also seek credits in Canada. The Finance Minister reminded the members of the House that with such steps Canada was reviving and developing her own export trade, and that the orders for food, railway equipment and ships placed by some of the countries named had already been of great value.

In the debate on this measure the next day Ilsley told the House that in the next session a special piece of legislation would be introduced to provide a large credit to Britain, and that in the meantime resources were adequate for furnishing Britain with abundant supplies. It was obvious to his hearers that the outcome of the Anglo-American loan negotiations in Washington must be known before the Canadian-British arrangements were made. The bill, known as the Export Credits Insurance Act, was passed on Dec. 6.

The measure providing for Canada's participation in the Bretton Woods Agreement had a brief but stormy passage through the House in December, but was finally approved on Dec. 14 by a vote of 169 to 9. Those who voted against the bill were all members of the Social Credit Party, who opposed the use of the gold standard, the "surrender of Canadian sovereignty," the "export of unemployment" by the United States and several other trends which they believed would follow. In the Bretton Woods Agreement Canada's share in the monetary fund was set at \$300,000,000 and in the bank at \$325,000,000.

Participation in UNRRA. At the third council meeting of the United Nations Relief and Rehabilitation Administration held in London in August Canada was represented by L. B. Pearson, Canadian Ambassador to Washington, as chief delegate, and three others. Canada's first orders for international relief supplies to be furnished to UNRRA were made public in July. They included 20,050 tons of agricultural machinery and 14,400,000 pounds of Canadian canned fish. The effect upon the country's expanded war plants of the maintenance of such demands was welcomed even in the initial stages, and it was common knowledge that larger orders were under discussion between UNRRA and the Government.

The Peacetime Budget. In Canada's first peacetime budget, which was presented in the House of Commons by Finance Minister J. L. Ilsley on Oct. 12, the relief from wartime needs was reflected in a series of tax reductions amounting to \$100,000,000 in the remaining part of the current fiscal year ending Mar. 31, 1946. The modifications included a 16 per cent cut in the personal income tax, reduction of the excess profits tax to 60 per cent with the refundable portion eliminated, important excess profits tax concessions to small business concerns,

abolition of the 10 per cent war exchange tax, and exemption from the sales tax for all machinery and apparatus used directly in the manufacture of goods.

Isley said that the changes were made in recognition of "the paramount importance of assisting speedy reconversion, of restoring incentives, and of encouraging enlarged and efficient production and export on which our employment, income and welfare depend." Total expenditures for the year 1945-46 were estimated at \$4,650,000,000, revenues at \$2,500,000,000 excluding refundable taxes, and the deficit at \$2,150,000,000, or \$359,000,000 less than in the previous year. No provision was included in expenditures for subscriptions to the Bretton Woods international monetary fund of the International Bank for Reconstruction and Development, with the result that only token contributions could be made in the current fiscal year. Export credits subsequently granted and loans to the Foreign Exchange Control Board were also outside the budget.

Problems of Reconversion. Canadian industry at first accomplished its tasks of reconversion with greater ease than had been anticipated. Manufacturing resources more than doubled during the war, according to a report sent to the House of Commons in December by the Reconstruction Department, and many industries planned expansion and the production of new lines, including more than 100 major products never before manufactured in Canada. Nevertheless the number of unemployed, which rose rapidly towards the end of the year, reached 174,000 in the latter part of November. As winter drew near the cessation of some seasonal work and the accelerated pace of discharges from the armed forces contributed to the situation. Although labor surpluses were conspicuous in the wartime industrial centers, actually unemployment was present throughout the Dominion.

Industrial disputes were a disturbing factor in the economy in the latter part of the year. A strike of the United Automobile Workers (C.I.O.) in the Ford Motor Company of Canada plant in Windsor, Ontario, which began on Sept. 12 and involved 10,000 workers, was extremely difficult of settlement. On Nov. 12 Labor Minister Humphrey Mitchell was obliged to report to the House of Commons that after a six-day visit to Windsor he could report no settlement in the strike, which was now augmented by a sympathy strike of about 30 other plants in the district. On Nov. 27 Mitchell and Ontario Labor Minister Daley offered a formula which the union rejected but on which it took a second vote in December. The plan provided for negotiation plus arbitration on union demands, the chief of which were union shop and checkoff. On Dec. 19 the union voted to return to work pending negotiations.

The cost-of-living index for Canada, calculated on the basis that 1935-1939 equals 100, stood at 119.9 on Nov. 1. Fluctuations in the index have not been reflected in wage rates since cost-of-living bonuses were merged with basic wages under Government order. The rationing of meat and butter was continued after both were dropped in the United States, and a more limited butter ration was announced for 1946. The Dominion-Provincial Agriculture Conference agreed on Dec. 5 to let the 1946 wheat acreage stand unchanged from that of 1945 at 23,414,000 acres for the whole of Canada and 22,566,000 acres for the prairie provinces. It was announced in October that by agreement between the United States and Canada

the Canadian Army would take over on Apr. 1, 1946 responsibility for maintaining that part of the Alaska highway which runs through Canada.

The People. The estimated population of Canada in 1945 was 12,250,000. Approximately one-half of the population is of British origin, one-third of French origin, and the remainder diverse, including German and Ukrainian.

The marriage rate for 1942, the highest on record for the Dominion, was 10.9 per thousand, but it dropped in 1943 to 9.4 per thousand. Births in 1943 were 118,035, at a rate of 24 per thousand; deaths, 118,494, at a rate of 10.1. Infant mortality rate in 1943 was 54 per thousand. War casualties to Aug. 13, 1945, were 102,954, of which 37,964 were recorded deaths.

Apart from a considerable number of private schools, education in Canada is financed mainly by local school authorities and assisted by provincial grants. Nearly three per cent of the young people attend universities. In the 1941 census religious affiliations were listed as follows: 43 per cent Roman Catholic, 19 per cent United Church, 15 per cent Anglican, 7 per cent Presbyterian, 4 per cent Baptist and 12 per cent distributed in smaller denominations.

Expanded Economy. Agriculture, which employed about 25 per cent of the people in 1941, showed production valued at \$2,500,135,000 in 1944. The importance of manufacture increased rapidly during the war and reached an output valued at \$8,733,000,000, according to the latest figures available. Exports, large in 1944, amounted to \$3,439,953,165, while imports stood at \$1,758,898,197 in the same year.

ALZADA COMSTOCK.

CANADA, The United Church of. The designation applied to the single body formed by the union in 1925 of the Congregational, Methodist, and Presbyterian churches in Canada; the Methodist churches of Newfoundland and Bermuda are also included. In the year of 1944 there were in Canada, Newfoundland, Bermuda 6,892 preaching places (including home missions) in 2,730 pastoral charges, 739,079 communicant members, and 1,738,510 persons under pastoral care. A total amount of \$15,018,052 was raised for all purposes. At the Eleventh General Council held in London, Ont., in September, 1944, the Rev. Jesse H. Arnup, B.A., D.D., was chosen moderator for the ensuing biennium. Rev. Gordon A. Sisco, M.A., D.D., is general secretary. Headquarters: 421 Wesley Building, Toronto, Ont.

CANTON ISLAND. An atoll of the Phoenix group (3° to 5°S. and 170° to 175°W.) in the central Pacific which with Enderbury Island of the same group is under the joint control of Great Britain and the United States (Anglo-U.S.A. Pact of Aug. 10, 1938, and Notes of Apr. 6, 1939). Canton is 29 miles in circumference and has a land mass of from 50 to 600 yards wide which encloses a lagoon 9 miles in diameter. Enderbury is 2.5 miles long and 1 mile wide. Canton was a port of call on Pan American Airways' transpacific air service from Honolulu to Auckland, New Zealand, which commenced on July 12, 1940. Early in 1942 United States armed forces were stationed on the island, which became an important link in the air transport route to the battle fronts of the southwestern Pacific and a base for air patrol operations.

CARIBBEAN COMMISSION, Anglo-American. A Commission created by a joint communiqué issued

Mar. 9, 1942, by the British and United States Governments, for the purpose of encouraging and strengthening social and economic cooperation between the United States of America and its possessions and bases in the area known geographically and politically as the Caribbean, and the United Kingdom and the British Colonies in the same area, and to avoid unnecessary duplication of research. The Commission serves in an advisory capacity to the British and U.S. Governments. Members concern themselves primarily with matters pertaining to labor, agriculture, housing, health, education, social welfare, finance, economics, and related subjects. Where the Commission's advice requires administrative action it works with the appropriate British and United States agencies.

The Commission consists of six members. Three are appointed by the President of the United States, and three by His Majesty's Government in the United Kingdom, two of whom have been nominated permanently, the third being appointed *ad hoc* according to the problems under consideration. The United States Section, which is directly responsible to the President, operate as an integral unit of the Department of State.

U.S. Chairman: Charles W. Taussig; British Chairman: Sir John S. Macpherson.

CARNEGIE CORPORATION OF NEW YORK. Established by Andrew Carnegie in 1911, this corporation was formed for the advancement and diffusion of knowledge and understanding among the people of the United States and the British Dominions and Colonies. Its total endowment is approximately \$135,000,000, of which \$10,000,000 is applicable in the British Dominions and Colonies. Its income only is subject to the disposal of the Trustees.

During the year ended Sept. 30, 1945, the Corporation appropriated \$1,002,500 for other Carnegie agencies, for research, study, and publication, and for various purposes of colleges and universities. Of this amount, \$567,000 was devoted to activities connected directly with the war effort, thus making a total of \$2,771,867 granted for such purposes during 1940-45.

The trustees of the Corporation are: Thomas S. Arbutnot, W. Randolph Burgess, Vannevar Bush, Nicholas Murray Butler, Oliver C. Carmichael, William Frew, Henry James, Devereux C. Josephs, Nicholas Kelley, Russell Leffingwell, Margaret Carnegie Miller, Frederick Osborn, Arthur W. Page, and Elihu Root, Jr. Devereux C. Josephs was elected President to succeed Walter A. Jessup who died in 1944; he took office June 1, 1945. Other officers of administration are: Robert M. Lester, Secretary; C. Herbert Lee, Treasurer; and Ernest A. Farintosh, Comptroller. Office: 522 Fifth Avenue, New York 18, N.Y.

Carnegie Endowment for International Peace. Founded by Andrew Carnegie in 1910, the endowment consists of a trust fund of \$10,000,000, the revenue of which is to be administered to hasten the abolition of international war. The work is carried on in three Divisions: (1) Division of Intercourse and Education; (2) Division of International Law; (3) Division of Economics and History.

A special library containing 70,000 volumes on all aspects of public international relations is maintained in Washington. During the fiscal year ended June 30, 1945, the Endowment's income amounted to \$531,443, which included a grant of \$100,000 from the Carnegie Corporation of New York. During this period, the Endowment expended \$558,168, which included expenditures from balances brought forward from previous years. The officers

are: President, Nicholas Murray Butler; Vice President, John W. Davis; Secretary, George A. Finch; Treasurer, Eliot Wadsworth. Administrative offices and the Division of International Law are at 700 Jackson Place, Washington, D.C. The other Divisional offices are at 405 W. 117 St., New York City.

Carnegie Foundation for the Advancement of Teaching, The. A foundation established in 1905 by Andrew Carnegie, who gave an endowment of \$10,000,000 for paying retiring allowances and widows pensions in the United States, Canada, and Newfoundland and for various other purposes in the field of higher education. Incorporated by Act of Congress in 1906, the Foundation received a further gift of \$5,000,000 from Mr. Carnegie and appropriations totaling \$13,250,000 for endowment and reserves from Carnegie Corporation of New York. On June 30, 1945, its resources amounted to \$16,520,039. In 1944-45, it disbursed \$1,879,205 for allowances and pensions. It awards no scholarships or aids of any kind. The Foundation's Annual Reports and Bulletins deal with many phases of higher education. In 1944 its principal studies concerned the educational appraisal of individuals through new-type tests and testing, particularly at the graduate level. Oliver C. Cromwell is President of the Foundation, and Howard J. Savage Secretary and Treasurer, with offices at 522 Fifth Avenue, New York City, 18.

Carnegie Hero Fund. A Fund established in 1904 by Andrew Carnegie to help those who have risked their lives to an extraordinary degree to save human life or to aid dependents of rescuers who have lost their lives in the performance of their acts. The original endowment was \$5,000,000; the amount expended to Sept. 30, 1945, \$6,683,000. Dr. Thomas S. Arbutnot is President and Mr. C. B. Ebersol is Assistant Secretary and Manager of the Fund, the address of which is 2307 Oliver Building, Pittsburgh, 22, Pa.

Carnegie Institute. An Institute located in Schenley Park, Pittsburgh, Pa., founded and endowed by Andrew Carnegie in 1896. It comprises the Department of Fine Arts, The Carnegie Museum, and the Carnegie Music Hall. Thirty-six prominent citizens of Pittsburgh constitute the Board of Trustees. The officers are as follows: William Frew, President; Roy A. Hunt, Vice-President; Augustus K. Oliver, Secretary; Thomas L. Orr, Treasurer.

Carnegie Institution of Washington. An organization founded in 1902 by Andrew Carnegie "to encourage in the broadest and most liberal manner investigation, research, and discovery, and the application of knowledge to the improvement of mankind." Income on investments for the year 1944 amounted approximately to \$1,200,000.

Organization of the normal research program of the Institution remains much as described in YEAR Book for 1941. Due to the war emergency, however, the entire resources of the Institution including laboratory facilities and personnel have been made available to the U.S. Government, and most of the Institution's long-time projects have been temporarily deferred in lieu of war research contracts with the Government. The President of the Institution is the Director of the Government's Office of Scientific Research and Development. Now that the war is over the Institution expects to return to normal ways as soon as possible, preceded by discussion and formulation of future research programs.

W. Cameron Forbes is Chairman of the Board of Trustees of the Institution, and Vannevar Bush is President. Other Trustees are: James F. Bell, Rob-

ert Woods Bliss, Lindsay Bradford, Frederic A. Delano, Homer L. Ferguson, Walter S. Gifford, Herbert Hoover, Frank B. Jewett, Ernest O. Lawrence, Alfred L. Loomis, Roswell Miller, Henry S. Morgan, Seeley G. Mudd, Henning W. Prentis, Jr., Elihu Root, Jr., Henry R. Shepley, Richard P. Strong, Charles P. Taft, Juan T. Trippe, James W. Wadsworth, Frederic C. Walcott, and Lewis H. Weed. Headquarters: Sixteenth and P Streets, N.W., Washington, D. C.

CATHOLIC CHURCH IN THE UNITED STATES. The total Catholic population in the United States, Alaska and the Hawaiian Islands was listed at 23,963,671 in the 1945 edition of *The Official Catholic Directory*, representing an increase of 543,970 over 1944. These areas include the following ecclesiastical jurisdictions: 23 archdioceses, 98 dioceses (including a Greek Rite See and the Ukrainian Greek Catholic Diocese), the Abbatia Nullius of Belmont Abbey in North Carolina, the Military Ordinariate and the Vicariate Apostolic of Alaska.

The Archbishops and Bishops at their annual meeting in November, 1945, elected an Administrative Board of the National Catholic Welfare Conference which organized itself as follows: Archbishop Samuel A. Stritch of Chicago, Chairman of the Board; Archbishop John Gregory Murray of St. Paul, Vice Chairman of the Board and Episcopal Chairman of the Press Department, N.C.W.C.; Archbishop (now Cardinal) Francis J. Spellman of New York, Secretary; Bishop John Mark Gannon of Erie, Treasurer; Archbishop John J. Mitty of San Francisco, Episcopal Chairman of the Department of Catholic Action Study; Archbishop Joseph F. Rummel of New Orleans, Episcopal Chairman of the Legal Department; Archbishop Richard J. Cushing of Boston, Episcopal Chairman of the Youth Department; Archbishop James H. Ryan of Omaha, Episcopal Chairman of the Department of Education; Bishop John F. Noll of Fort Wayne, Episcopal Chairman of the Department of Lay Organizations, and Bishop Karl J. Alter of Toledo, Episcopal Chairman of the Department of Social Action.

Reporting to the meeting of Archbishops and Bishops as Chairman of the retiring N.C.W.C. Administrative Board, Archbishop Edward Mooney of Detroit noted that "some of the most momentous events in history" had taken place in the preceding 12 months, and that the Church in the United States had felt the impact of international developments in two important ways. One of these, he said, was in the matter of relief and rehabilitation of devastated countries and their peoples, and the other was in the sense of responsibility for the establishment of a peace of justice and charity based on the principles laid down by Pope Pius XII. To illustrate the multiplicity of "matters in which our concern has been enlisted during the year," Archbishop Mooney cited repeated criticisms by Moscow on the Vatican and the Catholic Press in the United States; the fate of the Church in Poland, Slovakia, and Lithuania; displaced Lithuanians in France, Ukrainians in Germany, Croats in Italy and Slovenes in Austria; the alleged interferences with the meeting of the German Bishops at Fulda; the fate of Korean Catholics; and the international Catholic relief organization. There was anxious concern, too, Archbishop Mooney said, about numerous and complex problems growing out of "the crescendo of the war effort" at home. Among these, he listed proposed manpower draft, proposed nurses' draft, and the increasing shortages in critical materials vital to Catholic institutions.

Archbishop Murray reported to the meeting that there is an impressive and continuing advancement to be noted in the field of the Catholic Press, and that the N.C.W.C. News Service, founded by the Bishops a quarter of a century ago to serve this press, "has had a powerful part" in it. He said nine U.S. Catholic publications were founded within the twelve months covered by his report, and that the dispatches of the News Service were then going to papers in 32 countries. He said *Noticias Catolicas*, the Spanish-language news service issued by the N.C.W.C. Press Department, is making "notable progress" in Latin-America.

Reporting to the meeting that the Catholic Press is manifesting "a strong willingness to go ahead," Archbishop Murray said the N.C.W.C. News Service is planning to extend, intensify and further coordinate its system of correspondence on the continents of Europe, Asia and America; to strengthen its news-gathering network in continental United States; and to quicken transmission facilities in every way possible. Recounting some of the more important news happenings in the course of the year, Archbishop Murray said Pope Pius XII "more than ever stood out as a world figure," and that the News Service was able to make available to the Catholic Press Vatican documents of enormous historical importance.

Giving a quick glance to the numerous problems confronting Catholic education in the United States during the war years, Archbishop John T. McNicholas, O.P., of Cincinnati, retiring Episcopal Chairman of the N.C.W.C. Department of Education, directed attention to some of the demands that will have to be met in the postwar period. He reviewed the provisions of the Servicemen's Readjustment Act of 1944 and the programs for international cultural cooperation. He said a Treasury Department report had announced that Catholic schools in 92 dioceses had sold more than 65 million dollars in war bonds during the 1944-45 school year.

On the basis of returns from 103 dioceses, Archbishop McNicholas said a 1944-45 statistical survey showed a 3.8 percent increase in the enrolment of Catholic elementary schools over a period of three years. Final results, he added, are expected to show little or no increase in secondary school enrollments, while a loss of 15.5 percent in three years is revealed in the Catholic university and college enrolment figures.

Bishop Alter reported widespread activities on the part of the Department of Social Action, to acquaint the nation with the undertakings of the San Francisco Conference, the Dumbarton Oaks Proposals and the Bretton Woods Agreements. In addition to its normal work, Bishop Alter said, the Department's new undertakings included a Seminar on the Spanish-speaking people of the Southwest; assistance to Archbishops and Bishops of the Southwest in developing a general religious, social, and economic welfare program for the Spanish-speaking, and assistance in negotiations with Catholic organizations in Latin America for a second Inter-American Seminar of Social Studies in Havana. Bishop Alter noted that, due to war conditions, the Catholic Conference on Industrial Problems at Burlington, Vt., was the only one it was possible to hold during the year, but that the Catholic Association for International Peace issued four pamphlets and six committee statements, dealing mainly with international peace, while one of the Association's members prepared a new edition of "Pope Pius XII and Peace, 1939-1944."

Bishop Noll reported that nine national organi-

zations are now affiliated to the National Council of Catholic Men. He said the "Catholic Hour" radio program produced by the N.C.C.M., had been on the air 15 years and at the time for which he reported was being carried over 99 stations. Since the beginning of the "Catholic Hour," he added, a total of 1,967,834 pamphlets, containing 7,455,036 addresses, have been distributed. The newer "Hour of Faith" program, also sponsored by the National Council of Catholic Men, has distributed 122,000 copies of separate talks, the Bishop said. Work on behalf of better race relations occupied an important place on the agenda of the National Council of Catholic Women, Bishop Noll also reported. Completing its 24th year, the Bishop continued, the National Catholic School of Social Service, sponsored by the N.C.C.W., reported an enrollment of 176 graduate students from 29 dioceses, two students each from the Philippines and Panama, and one student each from the Dominican Republic, Brazil and China.

Archbishop Rummel said the effects of a prolonged war on the activities of Catholic organizations have been reflected in the work of the N.C.W.C. Legal Department, which, he said, was frequently called upon to assist Catholic institutions in all parts of the country in their relations with departments and agencies of the Federal Government. The department cooperated with the State and War Departments in matters relating to foreign mission fields, and helped to identify missionaries rescued or released from prison camps.

Archbishop Ryan, reporting as Chairman of the Youth Department on last year's Administrative Board, said the N.C.W.C. Youth Department, fulfilling one of its primary purposes, had represented Catholic interests on various committees and councils in 35 different instances during the year. "It is clear," Archbishop Ryan said, "that the Youth Department is not an agency sponsoring a youth movement nor an over-all authority imposed on existing youth groups or organizations. In the future as in the past five years, the Youth Department will focus its attention on establishing methods for the exchange of information among Catholic youth leaders, in the promotion of an adequate degree of coordination among both youth and their leaders, and proper representation of Catholic interests and policies to national governmental and private youth-serving agencies."

The N.C.W.C. Bureau of Immigration—with a national office in Washington and branches in New York and El Paso—gave assistance to 78,300 persons in 73,892 separate cases during the year, it was reported. One type of appeal received by the Bureau which is expected to increase is for assistance to service men in obtaining the necessary documents to effect the immigration of their foreign wives to this country.

For the first time in history, the Business Office reported that the circulation of N.C.W.C. publications topped the one million mark, a total of 1,003,378 copies of publications being distributed during the twelve months, it was said. "The Bishops Speak Out on World Peace," combining two statements issued by the American Hierarchy, reached a circulation of 457,832 copies.

As a part of the Department of Social Action report, it was stated that the Family Life Bureau of that department held a Family Life Conference at the Catholic University of America, Washington, D.C. The Confraternity of Christian Doctrine launched in 1945 a Crusade of Prayer for the beatification and eventual canonization of Pope Pius X, in commemoration of the fortieth anniver-

sary of his Encyclical Letter *Acerbo Nimis*, which gives directives for the teaching of Christian Doctrine to children and adults, and calls for the establishment of the Confraternity in every parish throughout the world. Despite the difficulties occasioned by the war, more than 700,000 students were enrolled in 8,253 religious vacation schools during the year covered by the report. It was also stated that permission had been granted gratis to 32 publishers to reproduce copyrighted Confraternity texts, and that over 4½ million religious books and articles have been given to chaplains of the armed forces for free distribution.

CENSORSHIP, Office of. An emergency war agency which was created Dec. 19, 1941. Its purpose was to censor communications by mail, cable, radio, or any other means of transmission between the U.S. (or its territories) and any foreign country. The Office was further directed "to coordinate the efforts of the domestic press in voluntarily withholding from publication" news which could not be released without endangering the prosecution of the war. The Director of Censorship was Byron Price. The Office was discontinued Nov. 15, 1945.

CENSUS, Bureau of the. A branch of the U.S. Department of Commerce which serves as the fact-finding agency of the Government. It conducts the decennial census of population, the quinquennial census of agriculture, foreign trade and vital statistics reports, data on local governments, etc. Director: James C. Capt.

CHEMISTRY. During the early months of 1945 chemists and chemical industries were mainly concerned with the intensified war effort. Research was still largely under cover of war secrecy and manufacturing chemists were generally guided, directly or indirectly, by the needs of the fighting forces. The cessation of hostilities has brought a change of viewpoint in chemistry as in other lines of human endeavor. The curtain of secrecy is being raised gradually and information is becoming available regarding some of the progress which has been made behind the scenes during the war years. Not all the developments of this period are yet available, but enough is now known to mark these years as a period of great progress. In view of the extensive and comprehensive advances which have been made, Dr. C. M. A. Stine of the du Pont Company has referred to the world of 1940 as "so distant in the past that it has become antiquity, as seen through scientific eyes."

It has been estimated that United States chemical and allied products in 1944 reached a total of \$8,300,000,000, which is two and one-quarter times the similar production of 1939. We have become so accustomed to seeing production figures of each year outstrip those of all preceding years that we have come to expect new records as a matter of course. Now that the production race has been won some thought is being given to the question: "How long can our abundant natural resources stand the strain?"

Minerals. The U.S. Department of the Interior has attempted to answer this question as it applies to our mineral resources by estimating the number of years that our unmined supply will last if consumption is at the same rate as that of 1935-39. The estimate is shown in Table I. It is quite certain that in the case of some of these materials future consumption will be greater than that of the prewar period. Other estimates have been less optimistic. Iron and steel, which have been called the

most basic of all commodities in the industrial life of the nation, are now dependent upon high grade ore which is rapidly disappearing. Good authority tells us that the present supply of high grade ore will be exhausted in 22 years or less. After this period has been passed recourse must be had to low grade ores which will obviously impair production. During World War II the United States furnished about 60 percent of the total petroleum used, although our known reserves are little more than one-third of the world supply. It is obvious that our natural resources are not inexhaustible. While we have justifiable pride in the splendid production of the war years and the contributions which these supplies have made it is clear that we must cease to be prodigal of our natural resources and inaugurate at once a program of preservation, conservation, and development.

The outstanding chemical events of 1945 are unquestionably connected with the quantity separation of the isotopes of uranium and carbon. Most highly publicized of these processes has been the large scale production of the transuranium elements neptunium (Np, atomic number 93, atomic weight 239) and plutonium (Pu, atomic number 94, atomic weight 239). These steps, together with the fission of the uranium atom, lead directly to the atomic bomb (q.v.) which is destined to have a tremendous influence on the future history of the human race. The separation of the isotopes,

TABLE I—U.S. DEPARTMENT OF INTERIOR ESTIMATE OF THE UNMINED SUPPLY OF DOMESTIC MINERAL RESOURCES BASED ON THE RATE OF CONSUMPTION FOR 1935-39

Years		Years

the production of the transuranium elements and the fission of uranium had all been accomplished previously but always on a small scale. The quantity operation and its control required the combined efforts and ingenuities of the largest and most brilliant group of physicists, physical chemists, chemists, physicians, sociologists, and other scientists that have ever been associated upon a single project. For the first time in scientific history elements were manufactured in relatively large quantities. A new scientific era was ushered in, new sources of power were revealed and new problems were uncovered which are likely to dominate the thinking of mankind for years to come in his scientific, social, political, humanitarian, and commercial relationships.

One of the spectacular accomplishments in connection with carrying out the Manhattan Project was the preparation of three tons of pure uranium metal by Dr. H. C. Rentschler and Dr. J. W. Marden of the Westinghouse research laboratory. To meet the sudden call they prepared potassium uranium fluoride, then electrolyzed the fused salt in graphite cells. The output, which had previously been measured in grams, rose to 500 lbs. per day and the cost dropped from \$1,000 per pound to

\$22. The material prepared in this way was used to make the first atomic pile.

It has recently been announced that the heavy isotope of carbon C^{13} is now available in quantity. The carbon of commerce contains only 0.7 percent of this isotope. The use of this heavy isotope as a tracer element will permit the biochemist to follow in exact detail the mysterious transformations in metabolism both in health and in disease. It is probable that such studies will answer many questions concerning nutrition and may furnish clues to the cause and cure of such diseases as cancer, diabetes, and arterial sclerosis.

Metals. The shortage of metals has now largely disappeared. Tin continues to be scarce. On July 1 the stockpile of tin in the United States was reported to be only 95,572 tons, which may be compared to the consumption of 89,500 tons in 1944 when rigid restriction prevailed. The usual estimate is that two years will be required to get an adequate supply of tin from the Far East unless hidden stocks and machinery are discovered. Other estimates, as short as 6 months, are based upon the fact that straits tin is gathered largely by hand labor, so the building of machines is not necessary.

Lead, one of the last of the metals to be placed on the restricted list during the early months of the war, continues to be prominent among commodities which are still scarce. Controls of distribution are expected to be continued through most of 1946. The government stockpile in 1943 amount to 273,000 tons, but early in 1945 it had fallen to 80,000 tons. One of the main difficulties has resulted from labor shortage at the mines. Production in 1945 was in the neighborhood of 400,000 tons, while the consumption was in excess of 1,000,000 tons.

There is also a shortage in antimony, bismuth, cadmium, platinum, and nickel. Mercury has begun to come in again from Spain; the recent mercury battery promises to increase the demand for this metal. The American potash supply seems to be able to meet the demands made upon it.

The light metals aluminum and magnesium which early in the war period were among our greatest worries because of the limited supply, are now so abundant that the problem of their utilization has become difficult. Many of the war-time plants for the production of both metals have been closed and their ultimate disposition furnishes a puzzling problem. Intense study is being made to find new commercial outlets. The predicted three-way commercial competition between alloys of the light metals, steel, and plastics is beginning to appear. It may take some time for these rival materials to adjust themselves completely to the postwar situation where each can find applications for which it is especially fitted.

It has now been revealed that the production capacity for magnesium in Germany in 1944 reached a total of about 70,000,000 lbs. per year, double the estimated capacity of 1939. The enlarged production of aluminum proved to be more difficult on account of the scarcity of bauxite. Small importations of this ore were made from adjacent European countries, and some aluminum was extracted from clay, using the familiar method of extraction with sulfuric acid and then precipitation with the aid of alkali. This process proved to be expensive.

One new use for magnesium which seems likely to require a considerable tonnage and to meet a long felt need is as expendable anodes to furnish "cathode protection" from corrosion to underground pipe lines. Encouraging results have been

obtained from field tests using special magnesium alloy anodes weighing from 16 to 47 lb. These are placed 5-10 feet from the pipe line and are buried in soil which has been conditioned to give the desired resistance. A heavy insulated copper wire gives contact between the pipe and the anode. The anodic oxidation which takes place on the magnesium reduces or entirely prevents the corrosion of the iron. The anodes are expected to last for about 10 years and this period may be extended by further study. This device may furnish a successful solution to one of our greatest and most troublesome corrosion problems.

Lithium (See YEAR BOOK for 1944, pp. 113, 355) continues to attract attention. One of the effects of the insistent wartime demand has been the considerable amount of lithium phosphate which has been separated from the slimes of the soda recovery process at Trona, California. This lithium salt, Li_2NaPO_4 , is difficultly soluble and a special flotation process recovers this salt from the alkaline brine. The finished material contains up to 22 percent Li_2O so it is the richest natural source of lithium now available. During the summer of 1944 the American Potash and Chemical Corporation put into operation at Trona a recovery plant which has quadrupled their former production of lithium salt. The total national production of lithium minerals during 1944 was 14,600 tons, nearly 80 percent more than 1943.

Now that the pressure upon production has been largely relieved, it is permissible to look back briefly to see how far we have really come. The steel trade may be taken as a typical example of the rapid growth of the metal industries. In 1939 the United States produced 47,141,709 gross tons of steel ingots and castings. The industry was highly localized, about 50 percent of the production coming from Pennsylvania and Ohio. In 1945 the total steel capacity was 95,505,280 tons, from 27 of the States. Notable among the new producing States are Oregon and Utah, a significant development for the Pacific Coast industries. The American steel industry is now capable of producing in 1.25 hours as much steel as the country produced during the entire year of 1860. The phenomenal increase in stainless steel production is likewise significant. Allegheny metal, introduced commercially in 1920, grew rapidly in popularity and in 1939 its production was valued at \$17½ million. In 1945 the estimated value reached \$65 million—an increase which is nearly four-fold in six years. The total stainless steel production in 1944 reached a new high of 477,448 net tons, a 4 percent increase over the previous high of 1943.

Medical Chemistry. The year 1945 has seen material development in the production and use of many drugs. For example the United States and Canada now have penicillin plants in operation which cost \$20,000,000 and produce 9 lb. of pure penicillin per day. The first price for penicillin was \$20 per 100,000 Oxford units; in Aug. 1945 the price was said to be 59 cents per 100,000 units. The drug has been released for civilian and veterinary use and a number of new applications have been suggested for it. A new and rapid method of purifying penicillin has been suggested by Drs. E. Cruz-Coke, F. Gonzalez and W. Hulsen, of the University of Santiago, Chile. It consists in filtering through both cathodic and anodic ion exchange resins. The purified product has all the penicillin activity of the original, and is free from toxicity for use with experimental animals and with man.

Rutin (See YEAR BOOK for 1944, p. 116) is now

most effectively obtained from green buckwheat plants, by alcoholic extraction. Clinical studies have been made with several hundred patients. The evidence continues to confirm its effectiveness in reducing increased capillary fragility to normal and to preventing retinal and cerebral hemorrhages which are associated with hypertension.

The U.S. Bureau of Plant Industry reports the successful growth of camphor basil at Beltsville, Md. This plant is an annual which requires about 120 days for growth. It gives a high yield of natural camphor, averaging about 100 lbs. per acre. It is estimated that the national requirements for camphor could be met by the cultivation of from 10,000 to 20,000 acres. Camphor was formerly imported, chiefly from Japan.

Relief for hay fever sufferers, especially the asthmatic complications, is promised in the preparation called adneprhine, put up by Frederick Stearns, Detroit. It is a mixture of neosynephine, aminophylline and phenobarbital. It is available on doctors' prescriptions.

Several new drugs have attracted attention during the year. One of the most promising of these is streptomycin, discovered by Dr. Selman A. Waksman of the New Jersey Experiment Station at Rutgers, and developed by Drs. H. W. Anderson and H. E. Carter of the University of Illinois. It is an antibiotic agent which is a mold product resembling penicillin, but produced by a different variety of mold (actinomycetes). This drug is not expected to replace penicillin but to supplement it, since it acts upon certain bacteria which are unaffected by penicillin. It is the best known drug for treating tularemia and has been effective in treating influenzal meningitis and other diseases. It gives promise also of usefulness in the treatment of undulant fever, intestinal infections, and even tuberculosis. Abbott Laboratories and Merck and Co. are building extensive plants for its production. Another promising antibiotic is subtilin, extracted from *B. subtilis* by Dr. Anthony J. Salle of the University of California at Los Angeles. In test tube experiments it kills tubercle bacillus effectively but is only slightly toxic to living tissue. It also seems to be effective against other disease-producing bacteria. Experiments on animals have not yet been reported.

Phenothiazine is a well-known compound, effective as a livestock remedy, of which the U.S. Department of Agriculture is quoted as saying it is a "wonder drug that kills more kinds of internal parasites in more kinds of animals than any other known chemical." It is an organo-metallic compound which is effective in disinfecting seeds and turf. It is to be manufactured in quantity by the du Pont Co. at their new Houston plant.

Professor R. A. Peters of Oxford, England, has announced the discovery of an effective remedy for arsenic poisoning. It is 2,3-dimercaptopropanol, but since it was first used as a therapeutic agent against the effect of certain war arsenicals, especially lewisite, it is known as bal (British anti-lewisite). This material has been studied intensively during the war both in Britain and the United States. It is effective in treating both the local and systemic action of arsenical war gases and in counteracting certain types of arsenical poisoning in civilian medicine. Preliminary clinical trials in cases of mercury poisoning are said to be "most encouraging."

Two powerful rat poisons have been described and may replace imported poisons which have been very scarce. No. 1080, which is sodium fluoroacetate has been developed by the U. S. Fish and

Wild Life Service in Denver and the Patuxent laboratory in Maryland. It is an inexpensive compound, it is very toxic to rodents; some animals seem to like its taste but others develop a gradual aversion to the water solutions. It is highly toxic to cats and dogs and presumably also to beneficial wild life. The other poison, known as antu, is alpha naphthyl thiourea. It was discovered at Johns Hopkins Hospital, is not distasteful to rats and is fatal to the Norway rats commonly found in the northern sections. It is claimed that it is harmless to man, to dogs and to the black rats of warmer countries. The former poison is manufactured by the Monsanto Chemical Co. and the latter by the du Pont Co. Sales of both poisons are restricted. The shortage of thallium in Germany has stimulated the production of substitutes. Castrix was made from acetoacetic ester and urea. It is very toxic to mice, but only mildly so to domestic animals.

Insecticides and Repellents. DDT has continued to occupy the spotlight. Early in the year it was not available for commercial uses, but on May 29 WPB announced the allocation of a limited amount for use in Oregon against the potato tuber flea beetle. The large scale manufacture of the two main materials used in the preparation of DDT (chloral and monochlorobenzene) was announced by Shawinigan Chemicals, Ltd. at Shawinigan Falls, Quebec. The production of DDT by manufacturers in the United States was estimated in the fall of 1945 to be about 1,500 tons per month. As the insecticide has become more readily available study of possible uses has been made and many new applications have been suggested.

A test for DDT has been announced by H. A. Stiff and J. C. Castillo. It is carried out by heating DDT with anhydrous pyridine solution containing xanthidrol and solid potassium hydroxide. A red color is produced. The test is sensitive to small amounts of DDT, but unfortunately a similar effect is produced by a number of other compounds containing a somewhat similar structure.

Several insecticides similar to DDT have been used. In Germany difluorodiphenyltrichloroethane, called gix, was said to be more effective than DDT, but was much more expensive. The U.S. Department of Agriculture has tested the effectiveness of tetrachlorodiphenyl ethane, to which the name TDE has been applied. In acetone suspensions and when applied as dust, these two insecticides are quite similar, but in fuel oil solutions TDE is definitely more toxic to anopheline larvae. There is still some uncertainty in regard to its manufacture on a large scale.

Other successful insecticides, not chemically related to DDT, have been described. Imperial Chemical Industries, London, England, have found hexachlorocyclohexane extremely interesting. The formula of this compound ($C_6H_6Cl_6$) has suggested the designation 666 as its common name. The gamma isomer, called gammexane, is extremely toxic to some insects. Since the compound is exceptionally stable at high temperatures, it may be sprinkled on a hot surface when it gives an insecticidal smoke. It may also be extended with gypsum and applied as a dust or used as a spray in a water-oil emulsion. Insect pests including locusts, weevils, mosquitoes, and house flies are destroyed. The lethal dose varies considerably but is generally lower than that for other insecticides. Present tests seem to justify the claim that gammexane is about five times as toxic as DDT.

Repellents have also been studied by the Bureau of Entomology and Plant Quarantine. Di-

methy phthalate is effective in preventing the bite of malaria mosquitoes and its use on the skin of man is safe. Its emulsion applied to outer garments gives protection against chiggers for almost a month unless the clothing is laundered or worn in the water. Dimethyl phthalate gives somewhat less effective protection against wood ticks. It has been used in the Allied armies since 1942 but it has not been available for civilian use.

A shark repellent was developed during the war by the U.S. Naval Research Laboratories. The purpose is to allay the fears of men who may be stranded in shark-infested waters. The repellent in briquette form is placed in a diffusion bag which can be attached to a life jacket. Two ingredients are present. One is a new black dye which diffuses and produces an "ink" similar to that in which an octopus or squid conceals itself from shark attack; the other ingredient is a chemical which was discovered in a study of decomposing shark meat. It is extremely offensive to sharks, but inoffensive to man. The use of the repellent makes a man in the water invisible to a shark and the locality repugnant.

New Processes and Products. By spraying 40 or 60 percent sulfuric acid upon the "face" of a turpentine-producing pine tree, the flow of gum is greatly extended and the work of chipping a new face is reduced to less than one-third. During the 1945-46 naval stores season sulfuric acid treatment is to be tried on 50,000 trees in the belief that this practice will prove to be a great advantage in the production of turpentine and rosin.

Maleic and fumaric acids may now be produced by vapor-phase oxidation of the halogenated hydrocarbons which are low-valued by-products of chemical industry. The oxidation is followed by the removal of hydrochloric acid which becomes a by-product of the new process. This method has been devised by Dr. W. L. Faith of Kansas State College and the State University of Iowa.

Two new electrolytic processes have been reported. The electrolytic deposition from organic suspension of vinyl plastics may become useful in preventing the corrosion of metals, in providing electric insulation and in the production of thin-walled plastic articles of intricate shapes. The deposition upon plastics of such metals as gold, silver, nickel, chromium, zinc, cadmium, lead and iron has been accomplished. The plastic so treated has increased strength, resistance to heat and water and the metallic coating is less easily corroded than when applied to a metal base because of the absence of galvanic couples.

A new synthetic wool has been prepared by Imperial Chemical Industries of London, England. The fiber, known as ardil, is manufactured from the protein of peanuts after the oil has been extracted. The fabric is soft, warm to the touch, does not shrink, is not attacked by moths, dyes like wool and absorbs moisture like wool. A ton of peanuts produce about 500 lb. of ardil. It is precipitated as fine filaments through a spinneret. It is expected to be cheaper than wool and is best used in mixture with wool or rayon. From peanut protein also have come some successful glues, with properties which make them useful for gluing purposes for which vegetable proteins were previously considered unsuitable.

Much attention has been given in the textile industries to the production of resin-coated fabrics. A recent development along this line is a vinyl resin-coated voile which is light in weight, strong, and warm to the touch. When made of rayon a square yard of the cloth weighs only two ounces,

yet it is strong and resistant to both wind and water. If nylon is used as the fiber the new voile is very strong. The material takes dye well and attractive colors are promised later when the fabric is available for general use. An extensive line of safety clothing has become available. It is made by coating a special cotton or duck with plastic. It is light in weight and protects against oil, acid, caustic, water, dust, and fumes.

A cotton fabric which resists mildew and rot has been developed at the Southern Regional Laboratory in New Orleans. Cotton is partly acetylated, which relates it somewhat to acetate rayon. The cloth is strong, resembles ordinary cotton in appearance, is not discolored, is not toxic, and has no odor. The fibers will be useful in cloth which will not mildew, and in tents, awnings and fish nets that will not rot when wet. Rotting tests show that the treated material is many times more resistant than is ordinary cotton. This process will be particularly valuable in the tropics where cotton deteriorates rapidly. In the same laboratory there has been developed a new cotton fabric which is suitable for fire hose. It is made by coating the yarn with a cellulose material which swells in water but does not dissolve. When the hose is in use this material swells and closes the small openings between the fibers of the fabric, making it almost water-tight. This process saves both the linen and the rubber lining which have been used in the manufacture of fire hose. The treated material is also expected to be useful in making tent cloth, tarpaulins, and rain-resistant coverings and clothing.

Rust prevention has received extensive study. Two new rust inhibitors have been developed by Carbozite Corporation of Pittsburgh. Both are suggested for indoor use, but will not withstand rain or snow. Carbo-C is inactive toward ferrous and non-ferrous metals including magnesium and aluminum; Carbo-N is satisfactory with ferrous alloys but reacts somewhat with zinc, lead, magnesium and aluminum. Karbate, a corrosion resisting product based upon graphite or carbon, has been produced by the American Cyanamide Co. It is highly resistant to both acid and base. The material is highly bondable, and readily machinable. The Standard Oil Co. of Indiana has developed a series of corrosion preventing lubricants called stanorust. They are made from mineral oil and are non-corrosive, non-gumming and stable against oxidation. Instruments coated with these materials are protected against corrosion during transportation and at destination and are available for immediate use, even at high altitudes or in cold climates.

Sodium chlorite is rapidly gaining popularity as a bleaching and oxidizing agent, in the textile industry. When acidified it liberates chlorine dioxide and in many places it produces a better and more permanent white without loss of strength than does sodium hypochlorite. It does not require such careful control conditions. It does not harm cellulose-acetate rayon and simplifies the manufacturing process. During the past year it has become popular for removing tastes and odors from public water supplies. The Mathieson Alkali Works is doubling the capacity of its sodium chlorite plant at Niagara Falls.

Iron pentacarbonyl is effective as an antiknock agent for ethyl alcohol fuels. A stabilizer may make it suitable for use in hydrocarbon fuels. Care is needed to prevent it from fouling the motor, but it is probably no more dangerous to handle than tetraethyllead.

Synthetic gum benzoin is now available in a

form which is comparable in purity and cost with the natural product from Siam.

Synthetic caffeine is to be manufactured by the Monsanto Chemical Co. in the world's first large plant for the production of this material. The plant is rated at \$1,500,000. The product is not expected for the present to displace caffeine from waste tea, coffee or cocoa, but will make the United States independent of foreign supplies and will insure against future shortages. The synthetic product is expected to have a greater purity than current USP standards. The present production in the United States exceeds 1,000,000 pounds annually. Its main uses are in the preparation of cola drinks and in drug and pharmaceutical preparations. There is a serious shortage in the present supply.

Hydrogen peroxide, 90 percent by weight and in commercial quantities, has been announced by the Buffalo Electro-Chemical Co. Production was begun in 1944 before information was available in regard to the manufacture of this material in Germany. Concentrated hydrogen peroxide of high purity is stable and may be handled without hazard. Its main uses depend upon its active ability to oxidize without leaving a residue. One volume of the liquid will supply over 400 volumes of oxygen gas. It will undoubtedly find many important applications.

The Institute of Paper Chemistry, Appleton, Wis., reports the extraction of a new polysaccharide from the lignin of black spruce. The yield of the purified product is 0.1-0.2 percent of the wood. Analysis of the polysaccharide shows the presence of galactose, arabinose, and uronic acid in molecular ratio of 4:1:1.

Utilization of Waste. The shortage of many essentials has served to stimulate efforts to produce useful materials from those by-products which are commonly referred to as "waste." Many encouraging results have been obtained, a few of which are outlined here.

Lignin has been called "the largest waste in industry"; pulp and paper mills have polluted streams with 2,000,000 tons a year while sawmills and woodworking plants have available wastes which could produce an additional 10,000,000 tons of lignin. Research Associate Robert S. Aries, of Yale University, has now proposed a method of using lignin as a fertilizer to supply humus and organic matter to depleted soils. He estimates that fertilized soils which need humus and organic matter would be improved 20 percent by the use of lignin. Less optimistic is Dr. Harry F. Lewis, Dean of the Paper Institute, Appleton, Wis., who calls attention to the numerous suggestions which have been made for the utilization of lignin and sulfite waste liquor. These suggestions have not been successful in utilizing the bulk of the available material, although some salable products have been obtained in small quantities. Much remains to be learned before these wastes reach their full value for commercial use. A \$300,000 research program has been installed at the University of Washington and in many other laboratories various phases of the problem are being seriously attacked.

The Northern Regional Laboratory of the Department of Agriculture, Peoria, Ill., has been successful in obtaining liquid motor fuel from corn-cobs, bagasse, peanut shells, flax shives, oat hulls and cottonseed hulls. Up to 95 gallons of fuel have been obtained from a ton of corn-cobs or cottonseed hulls; about half of this product is ethyl alcohol. A building in which the process is to be

carried out on a semi-commercial scale is being equipped. It is estimated that 100,000,000 tons of farm waste are available if the process proves to be successful. The cost of the fuel is to be determined later.

The shortage of sugar and carbohydrate crops has stimulated the study of obtaining sugar from wood and other cellulosic waste. Recently a progress report has been made, based upon work done in many localities and from various angles. Most attention has been centered around a modification of the Scholler process in which the wood is digested with sulfuric acid under pressure and at elevated temperatures. The hydrolysis takes place slowly. After a time the solution of simple sugars is withdrawn and may be purified or it may be fermented to form ethyl alcohol. The U.S. Forest Products Laboratory at Madison, Wis., reports the extraction of reducing sugars from such soft woods as Douglas fir, spruce, and southern yellow pine ranging from 45 to 57 percent of the weight of the wood. From hardwoods (oak, maple) 45-52 percent and from turpentine spent chips 35-37 percent were recorded. The alcohol yield per ton of wood ranged from 40 to 60 gallons for soft woods and 33 to 42 gallons for hardwoods. Difficulties were encountered in the fermentation of the wood sugar from Douglas fir. In addition to the main product, several by-products may be obtained and contribute to the success of the project. Tannins up to 5 percent can be obtained from oak at moderate cost. Lignin from 28 to 35 percent of the weight of dry wood is obtained but the lack of a profitable use for lignin is a material handicap. It is probable that bacterial fermentation of the wood sugar to produce such products as butyl alcohol, acetone or isopropanol may be successful in meeting cost problems. The present conclusion is that alcohol from the saccharification of wood is available to meet an emergency, but it alone is unable to compete in cost with alcohol from molasses at 5 cents per gallon. If the price of molasses reaches this figure, then the hydrolysis of wood will not be economically successful unless valuable by-products can be made to assume part of the cost.

Germany. Following the invasion of Germany, intelligence operations were undertaken by the allies to collect accurate data regarding German chemical war activities. A tremendous amount of information has been gathered much of which is not yet available for use. A preliminary report made by the Industrial Intelligence Staff, Chemical Warfare Service, gives a good idea of the extent and importance of these activities in Germany during the war.

The Haber process for the production of ammonia for the manufacture of fertilizers and explosives continued to hold a prominent place in German chemical industry. Synthetic fuel plants were developed rapidly increasing some five-fold during the war. These became a keen competitor of fixed nitrogen plants for the limited supply of hydrogen, which became one of the most critical of war materials. Much attention was given to its production. Apparently the water gas method was most extensively used, although some hydrogen was produced by electrolysis.

Acetylene was another raw material of prime importance. It was made largely from calcium carbide, although some was produced by the arc process. Safe methods for handling acetylene under pressure were devised and are very useful. These permit the use of acetylene at pressures up to 20 atmospheres and temperatures up to 200° C.

Acetylene was used as raw material for the manufacture of a long list of materials such as butadiene, glycerol, acrylic, adipic, maleic, succinic and glutaric acids, erythritol, allyl alcohol, vinyl derivatives, and many others.

Chlorine, a wartime essential, was produced in large quantities. Of particular interest were cells which used mercury cathodes. Some of these under construction at the close of the war were believed to have the largest chlorine capacity in the world. They used 28,000 amperes. Other smaller cells, 16,000 amperes, required 4.5 to 50 volts and had a current efficiency of 94 to 95 percent. One important application of chlorine was its use with acetylene in the manufacture of chlorine derivatives of ethylene.

Most intense general interest was centered around the chemicals used in the propulsion of the rockets. Power was supplied by a fuel and an oxidizer, the reaction taking place at a pressure of 30-40 atmospheres. Many combinations of materials were tested, but the most frequently used combinations consisted of methyl or ethyl alcohol as fuel, and liquid oxygen or a mixture of nitric and sulfuric acids or a concentrated hydrogen peroxide as the oxidizing agent. The large scale production of high purity and stable hydrogen peroxide of 80-85 percent was one of the outstanding accomplishments in chemical manufacture during the war. The persulfate process was mainly employed in production. Concentration was carried out by vacuum distillation in two stages. Two plants in operation had a combined capacity of 1,700 metric tons per month; a third plant was under construction at the close of the war with an estimated capacity of 2,100 tons.

SN 7618 the Latest Anti-malaria Drug. Encouraging reports are received from the Office of Scientific Research and Development concerning its four-year, \$5,000,000 anti-malarial campaign. The search for a satisfactory cure for malaria has been conducted in many laboratories. Some 14,000 compounds have been tested with lower animals and the most promising of these have been tried out on "human guinea pigs," volunteers from penitentiary inmates and conscientious objectors. The most successful results so far have been obtained from the preparation known as SN 7618. Chemically it is 7-chloro-4-[4-diethylamino-1-methylbutyl amino] quinoline. This drug was first made in Germany but the clinical tests there were not promising. Committee of Medical Research investigators arranged for the preparation of this compound by the original method which was tedious and expensive. The product, however, showed promising anti-malarial properties. Drs. C. C. Price and R. M. Roberts of the University of Illinois devised a direct and less expensive method for the manufacture of 4,7-dichloroquinoline, an intermediate which is essential for the production of the drug. They prepared 40 lb. of the intermediate which was used elsewhere for the preparation of the drug. Clinical tests were made in three civilian hospitals and four penal institutions. These studies were conducted under the auspices of various universities. In addition clinical trials were made in Army, Navy, and Marine hospitals. Experiments were also conducted by the Australians and the British and by the International Health Division of the Rockefeller Foundation. Results have been so encouraging that two tons of the drug are being prepared under OSRD contract for distribution for large scale clinical tests in those localities of the world in which malaria prevails. This drug is reported to

be more rapid, more active, and in the small doses necessary for treatment and suppression, it has less disagreeable side effects than quinine or atabrine. It is a cure for the type of malaria known as *falciparum* which is sometimes fatal. It is not a cure for the relapsing type of malaria (*vivax*) but gives relief in a third the time required by quinine or atabrine. A dose of 0.3 gram once a week is sufficient to check the attacks. A second drug, a relative of *plasmochin*, is believed to have curative powers over *vivax*. None of these drugs has yet been released for the use of the general public.

B. SMITH HOPKINS.

CHESS. Promise of the early return of international competition was seen in a radio match between United States and Russian teams in which the Soviet scored a surprising victory by the score of 15-4%. Leading experts of the two countries played simultaneously in New York and Moscow, their individual moves being recorded on huge boards.

Arnold S. Denker of Forest Hills, L.I., retained his national title, Mrs. Gisela Kahn Gresser of New York repeated in women's competition, and Reuben Fine of Washington, D.C., kept U.S. speed honors. Other leading champions of 1945 were: Dr. Alexandre Alekhine, Paris, world; Anthony E. Santasiere, New York, U.S. open; Paul Ellis, New York, U.S. amateur, Samuel Reshevsky, Boston, Pan-American; Mrs. Mary Bain, Miami, and Miss N. Mary Karff, Boston, tied for women's Pan-American; Brooklyn College, Intercollegiate League; and Harvard, H.Y.P.D. College League.

THOMAS V. HANEY.

CHILDREN'S BUREAU. With dramatic suddenness August, 1945, brought the beginning of the postwar period. Children's Bureau services halted by the war could be resumed. Losses that children in the United States had suffered could be faced and dealt with. Child life is interdependent from continent to continent. That American children escaped the ordeal of invasion puts a duty on American adults to help turn the interest of this and other unravaged countries toward immediate help for the uprooted, orphaned, shelterless, starving children of the battlefields. What is done for all children now—or left undone—sets the future of the world.

Policy Making and Research. The National Commission on Children in Wartime, appointed by the Children's Bureau in 1942, is providing the impetus toward progress in services for children. Its report, *Building the Future for Children and Youth*, issued in April 1945, contains detailed proposals for action. To achieve health and social-welfare services of high quality for all children and youth, the Commission urges that Federal and State funds be appropriated in sufficient amounts that each State may reach these goals within 10 years. This means the expansion of existing services for maternal and child health, for crippled children, and for child welfare under the Social Security Act. Programs administered by the Social Security Board having to do with the support of children should be extended and improved and grants of Federal funds made to States to share the cost of assistance to needy families. For youth as well as children the Commission urges Federal aid for education so that full educational opportunities may be assured to all and recommends the strengthening of Federal child-labor legislation to cover current gaps in the protection of child workers. Proposals for State and local community action include work-

ing for a 16-year minimum age for employment and achieving safeguards for adoption. The Commission proposes for immediate study a correlated mental hygiene program; guardianship for children; leisure-time services; and a comprehensive program for American youth.

In the field of research, publication by the Bureau of the Census of data on births and deaths for 1943 has enabled the Children's Bureau for the first time to compare infant and maternal mortality rates over a 10-year period. Although much information on these subjects has been available for a number of years, the first year in which reasonably satisfactory data were available for every State was 1933. Between 1933 and 1943 the maternal-mortality rate declined 60 percent—from 61.9 deaths directly due to pregnancy and childbirth in 1933 per 10,000 live births to 24.5 such deaths in 1943. The infant-mortality rate during the same years dropped from 58.1 deaths of infants under 1 year of age per 1,000 live births to 40.4 in 1943—a decrease of 31 percent.

The provisional birth rate for 1944 was 20.2 per 1,000 population compared with 21.5 for 1943 when births reached a wartime peak. The infant-mortality rate was reduced slightly in 1944—from 40.4 deaths of infants under 1 year of age to 39.8.

Closely allied to research in the children's field and to good infant care is complete and accurate birth registration. The Child Health Day (May 1) campaign for 1945, sponsored also by the Bureau of the Census, had as its slogan "A Birth Certificate for Every Baby in the U. S. A."

A joint committee representing the Children's Bureau Advisory Committee on Maternal and Child Health Services, the American Academy of Pediatrics, and the American Pediatrics Society drew up a report proposing "to make available to all mothers and children in the United States of America all essential preventive, diagnostic, and curative medical services of high quality which, used in cooperation with the other services for children will make this country an ideal place for children to grow into responsible citizens." The American Academy of Pediatrics adopted this report and requested the Children's Bureau and the U.S. Public Health Service to join in a survey in every State to determine the extension of personnel and facilities needed to meet this objective. The study is now in progress.

The Bureau gathered information on the administration and content of school health programs at the request of the State and Territorial health officers. As a result, the Children's Bureau, the Office of Education, and the Public Health Service issued a policy statement regarding the health program needed for school children. The facilities of 20 hospitals were studied with a view to arranging for postgraduate training of doctors and nurses in the care of premature infants. A conference of experts on dental care for children, called by the Bureau in February, 1945, made far-reaching recommendations. In September an adviser on dental services was added to the Bureau staff to develop standards for dental services to children and to serve as adviser on dental-care programs in the States.

In the social-service field of the Bureau's work, Congress appropriated funds for a Bureau study of guardianship laws and practices. The large number of children who require guardianship because they lost their fathers in the war makes deeper and wider knowledge of this subject urgent. In this same field many requests have come for advice on adoption legislation. A serious handicap in building good adoption legislation and practices

throughout the country is the lack of nation-wide statistics on adoption. The Bureau has obtained figures from the States that can supply them. From material from about 20 States, the Bureau estimates that 50,000 children were involved in petitions for adoption filed in the United States in 1944. In the States for which information is available, about one-half the children were being adopted by step-parents or relatives. Approximately one-third were placed independently of social agencies, although these agencies can effectively safeguard the child's rights and his future and the interests of the adoptive parents.

A report, *Changes in Volume of Foster Care, 1933-1943*, published in June, 1945, shows that the most significant quantitative changes between 1933 and 1943 in foster care were the increases in the number of children served by public as compared with private agencies and in the number of children cared for in foster-family homes as compared with institutions.

A Cross Section of Activities. To stimulate cooperation between Federal agencies concerned with youth, an Inter-agency Committee on Youth Employment and Education was set up, with the Chief of the Bureau as chairman. At its first meeting in April, 1945, a program of work was planned on student aid, counseling, and educational and work opportunities. The agencies represented are the Department of Agriculture, Office of Community Services, Office of Education, Social Security Board, War Manpower Commission, and Department of Labor.

In this field of youth employment an important activity is getting young workers interested in returning to school. The number of minors under 18 at work during the school year 1944-45 was estimated as about 3 million. During the summer of 1945 the number rose to nearly 5 million. The Children's Bureau and the U. S. Office of Education have conducted three annual campaigns to help communities get their young people back to school. The 1945 drive is credited with helping to stop the downward trend in high-school attendance (a drop of over a million in the first 3 years of war) by stimulating local efforts to convince young people of the value of education.

The Bureau was called upon for consultation in a variety of child-welfare services. For example, a problem aggravated by the war is that of illegitimate birth. Many unmarried mothers needed social and medical services and their babies needed protection against placement for profit or by well-intentioned but unqualified individuals. Births out of wedlock to wives of men serving overseas created special problems. Difficulties arose for local children's agencies from an acute shortage of foster-family homes, so important in today's child-welfare services.

One of the Bureau's basic bulletins for parents was completely rewritten—*Your Child From One to Six*. The Bureau published *Facts About Rheumatic Fever*, a brief popular bulletin, and *Childhood Mortality From Accidents*, a statistical study, and issued a series of folders on the mental-health aspects of children's eating habits. Four folders in the Bureau's series of advisory standards to aid employers in selecting nonhazardous jobs for young workers were issued in 1945: No. 12 for foundries; No. 13 for the brick and tile industry; No. 14 for the converted paper-products industries; and No. 15 for the slaughtering and meat-packing industry. This series was started early in the war as a result of the great influx of inexperienced 16- and 17-year olds into war jobs.

Federal Child-Labor Provisions. The administration of the child-labor provisions of the Fair Labor Standards Act of 1938 through a program for making certificates of age available for minors in industries subject to the act and through a program of inspection for compliance was continued.

Inspection of establishments producing goods for shipment in interstate commerce disclosed 3,481 establishments (about 8 percent of those inspected) employing minors under 18 in violation of the Federal law, an increase of 19 percent over the year ended June 30, 1944, and more than 100 percent over the previous year. In these establishments 13,289 minors were illegally employed, an increase of 58 percent over the year ended June 30, 1944, and nearly 200 percent over the previous year.

The Bureau revoked four wartime relaxations of child-labor regulations issued under the Fair Labor Standards Act. This action restores completely Child Labor Regulation No. 3 which controls the employment of 14- and 15-year-old children. Hazardous-occupations order No. 5 on the operation of power-driven woodworking machines will no longer contain the emergency exemption temporarily permitting 16- and 17-year-old minors to work on a few of the least hazardous machines.

To spread understanding of the child-labor provisions of the act, Bureau consultants conducted child-labor clinics in many communities for employers and representatives of State departments of labor and of education and of labor unions.

The Supreme Court on January 8, 1945, reversing a decision of the lower courts, ruled that the child-labor provisions of the Fair Labor Standards Act did not apply to the employment of messengers by the Western Union Telegraph Company. This means that telegraph messengers no longer are subject to the minimum-age provision of the Federal act, although they are still subject to State child-labor laws. This decision resulted in a marked rise in the number of employment certificates issued to 14- and 15-year-old children for messenger work.

Grants to States. The programs administered by the Children's Bureau under title V, parts 1, 2, and 3 of the Social Security Act and the emergency maternity and infant-care program continued in operation in all States and Territories except that Utah did not take part in the child-welfare program. Payment to States from Federal funds during the year ended June 30, 1945 were as follows:

Program	State Agency	Payment
Maternal and child-health services.....	Health department	\$ 5,553,000
Emergency maternity and infant care.....	Health department	45,000,000
Services for crippled children.....	Crippled children's agency	3,874,000
Child-welfare services....	Welfare department	1,366,000

Except in the case of emergency maternity and infant care, these sums supplemented or matched in large part State and local funds, and by no means represented the total amounts spent for the programs.

In the program for emergency maternity and infant care a total of 484,000 wives and infants of servicemen were authorized to receive medical, nursing, and hospital care during the year ended June 30, 1945, bringing to 884,000 the number of cases authorized for care since the first Congressional appropriation for emergency maternity and infant care in March, 1943. The funds were used by State health departments to pay doctors, nurses, and hospitals participating in the program for serv-

ices rendered to maternity patients and infants for whom care was authorized. Those eligible were the wives and infants under 1 year of age of servicemen in the four lowest pay grades of the armed forces and of aviation cadets.

The basic services for maternal and child health provided under the supervision of State and local health departments included prenatal clinics, child-health conferences, home-nursing visits, health services for school children, and nutrition, dental, and mental-hygiene programs. Most States managed to maintain existing services in spite of wartime shortages in professional personnel. Some States even started new programs for the care of premature babies or the improvement of nutrition services.

State registers for crippled children showed an increase of 18,500 during 1944, bringing the number registered to 381,906, the largest number since the Social Security funds became available. The number of children admitted to clinics for diagnosis and treatment and to public-health-nursing service increased in 1944; the number admitted to hospitals decreased slightly. Texas transferred its crippled children's services to the State department of health, making a total of 30 States in which this agency administers the program. During the year 1945 the Children's Bureau prepared an outline to help State agencies meet epidemics of poliomyelitis.

The range of services provided under the child-welfare program (title V, part 3), in connection with which the Bureau child-welfare consultants were called on, included development of broad programs of social services for children in local communities, licensing and supervision of foster homes and child-caring agencies; programs for dealing with juvenile delinquency locally (see article on Juvenile Delinquency); services for unmarried mothers; supervision of adoptions; the use of group work; and the drafting of State legislation.

The difficulty of obtaining enough qualified child-welfare workers for local work continued. Reports from State welfare agencies as of June 30, 1945, indicated about 3,700 workers giving some service to children, with more than 1 in 10 paid in whole or in part from Federal child-welfare funds. There were almost 2,000 workers providing direct services to children on a full-time basis, but in many instances the program was limited to foster-care services and did not include services to children in their own homes.

International Cooperation. At the Inter-American Conference on Problems of War and Peace, held in Mexico City in February and March, 1945, the Bureau's Chief acted as adviser to the United States delegation. The important Declaration of Social Principles of America adopted by the conference contains principles fundamental to family life and the security and opportunity that all children should have.

As official adviser to the delegates for the Government of the United States, the Chief attended the International Labor Conference in Paris in October, 1945. The membership of this conference consisted of representatives of governments, employers, and workers of 48 nations. One of the main subjects considered was the protection of children and young workers. Two of the resolutions adopted by the conference had to do with medical examinations for fitness for employment, and restriction of night work in non-industrial occupations, both relating to children and young persons.

The Bureau's Inter-American Unit cooperated with the other American republics in child-health

and welfare services through assignment of consultants to governmental agencies; through collaboration with the American International Institute for the Protection of Childhood with headquarters in Montevideo; through advisory service in connection with the revision of legislation affecting children and young people; and through programs of training in the United States for specialists from the other republics.

KATHARINE F. LENROOT.

CHILDREN'S FUND OF MICHIGAN. A Fund established by James Couzens with a gift of \$10,000,000 in 1929 to promote the health, welfare, happiness, and development of children in Michigan, primarily, and elsewhere in the world. During the fiscal year ending Apr. 30, 1945, a total of \$760,638.44 was expended. Total assets on that date were \$6,513,783.81. Chief officer: Wm. J. Norton, 660 Frederick Street, Detroit, Mich.

CHILE. A republic of South America. Area: 286,396 square miles. Population: 5,237,432 (1943) Capital: Santiago.

Chile varies from 45 to 250 miles in width and its length of 2,660 miles is more than ten times as much as its greatest width. The Andes, a central valley, and coastal ranges divide the country longitudinally, while it is separated latitudinally into the northern mining region, the central agricultural area, and the southern forest and grazing lands. The climate is extremely arid in the north, temperate in the central part, damp and cold in the south.

Government. Under the Constitution of 1925, Chile is a centralized republic of 25 provinces. The constitution provides for a bi-cameral Congress: a Senate of 45 members and a Chamber of Deputies of 147 members. Members of both houses are elected by proportional representation. Congress convenes on May 21 of each year and adjourns on September 18. The President is elected for a 6-year term, and is assisted by a Cabinet of 14 members, of whom one is without portfolio. President Juan Antonio Ríos Morales was elected on February 2, 1942, in a special election made necessary by the death in office of President Pedro Aguirre Cerda, and was inaugurated on April 1 of that year.

The People. The Chileans are predominantly of European descent, with some Indian strains. About 15 percent are mestizos and about 5 percent Indians. The largest foreign element is Spanish, but there are sizable numbers of Germans in the south-central area. Population density per square mile varies from 0.5 in the Province of Aysen to 256.3 in the Province of Valparaíso. More than 80 percent of the people live in the central valley. The largest cities are: Santiago, 984,500; Valparaíso, 263,200; and Concepción, 86,000.

Spanish is the official language, but German is spoken and taught in some communities of the country. The predominant religion is Roman Catholic.

According to official estimates, 76 percent of the adult population of Chile is literate. In 1942, 576,900 students were enrolled in 5,364 primary schools. In 1940, there were 87,265 students in 418 secondary schools, and a total of 6,402 students in the country's 5 universities.

Chile has advanced social legislation which provides pensions for sickness, maternity, and old age, as well as for invalids and survivors. The cost is borne by employers, employees, and the State. The Chilean Social Security Fund, established in

1924, handles the funds, and has accumulated capital of more than 54,000,000 pesos. This is a state corporation, which invests in social welfare projects, workers' houses, model farms, apartment houses, etc.

National Economy. Chile's economic structure rests upon its copper and nitrate deposits. These two products usually compose 70 percent of the total value of exports. In 1938 Chile produced 78.4 percent of the total Latin American output of copper; 36 percent of the total for the Western Hemisphere; and 17 percent of the world output. In 1944 Chile produced 490,441 tons of copper bars, over 1,100 tons more than were produced in 1943. Nitrate sales in 1943-44 totaled 1,050,555 tons, a decrease of some 190,000 tons from 1942-43 exports. In production of iodine, a by-product of nitrate, Chile leads the world, producing 69 percent. Chile is the leading coal producing country in Latin America, and has important deposits of iron ore, which yield normally about 1-500,000 metric tons annually. Because of transportation difficulties, production in 1944 fell to some 17,670 metric tons. Gold and silver are also mined in some quantity.

Chile's most important agricultural crops are: wheat, rice, oats, and barley. Raised in quantity also are corn, beans, peas, lentils, and fruit. Meat, wool, and wines are major products. Leading crop production for the year 1943-44 was: (in metric quintals) rice, 1,498,169; wheat, 9,788,089; oats, 1,141,566; barley, 765,073; (in metric tons) beans, 79,926; lentils, 9,435. In 1944 wine production totaled 314,000,000 liters.

Lack of coking coal, together with such factors as the small domestic market and high cost of credit, have held back industrialization of Chile. What manufacturing there is produces chiefly consumers goods for the home market.

Foreign Trade. Mineral products, principally copper and nitrates, compose Chile's chief exports. Exports of nitrate and iodine in 1944 totaled 976,808 metric tons. But animal products (wool, hides, meat), hemp, fibers, vegetables, nuts, and wines are also exported. In 1943 Chilean foreign trade, including specie, was valued at 1,514,500,000 sixpence gold pesos, of which exports accounted for 877,300,000 and imports for 637,200,000. Mining products exported amounted to 686,423,000 sixpence gold pesos; agricultural products, 61,333,000; animal products, 47,592,000; and food products, 20,974,000. In 1943 the five leading non-mineral commodities exported by Chile were: wool, hemp fibers, rice, sheep hides, and gold bars.

Leading commodities imported by Chile in 1943, listed according to value in sixpence gold pesos were: brown sugar, 54,521,000; cattle, 39,539,000; raw cotton, 17,539,000; wool textiles, 15,387,000; and cotton textiles, 13,382,000. Other significant imports included: spinning cotton and cotton yarn, mineral oil, coffee, maté, and machinery and apparatus.

Before 1940 the bulk of Chilean exports went to the United Kingdom and Europe; since then the Western Hemisphere has become Chile's chief market. In 1944, 46.4 percent of Chilean imports came from Latin American countries, chiefly Argentina, Peru and Brazil; these countries took 20 percent of Chile's exports. The United States provided 43 percent of Chilean imports and purchased over two-thirds of its exports, exclusive of sales "to order."

Events, 1945. Inflation and political differences continued to plague Chile as the year opened.

There was intense political activity during February, in preparation for the March elections at which the entire Chamber of Deputies and half the Senate were elected. The rightists blamed the Government for inflation, the increased cost of living, the large budget, and bureaucracy. The leftist parties claimed that these pitfalls would have been avoided if the Cabinet had been formed entirely from their ranks. On February 9 the Alianza Democrática, composed of all leftist political parties and the labor federation, announced its platform: (1) participation at the peace conference of American countries which had cooperated with the United States, (2) lower living costs, (3) state control of prices on essential imports, (4) rent reduction, (5) aid to the democratic peoples of Spain and Argentina in their struggle for liberation, (6) intensification of the Good Neighbor policy among the American republics.

The election, held on March 4, represented a set-back for the leftists, who retained a slim and doubtful majority in the Chamber and lost control of the Senate altogether. In the Chamber, the rightists won 71 seats: Conservatives, 36; Liberals, 31; Progressive Liberals, 1; Agrarians, 3. The leftist total of 75 seats was divided among: Radicals, 38; Communists, 18; Socialists, 7; Falange, 5; Democrats, 7. One seat was won by an independent. Rightists won 23 Senate seats: Conservatives, 10; Liberals, 10; Agrarians, 1; independent rightists, 2. The leftists got 22 places in the Senate: Radicals, 11; Socialists, 4; Communists, 4; Democrats, 1; independent leftists, 2.

The Cabinet offered its collective resignation on March 5 but President Juan Antonio Ríos rejected it because election returns were still incomplete, and the resignation was not renewed. Speaking at a La Serena agricultural meeting on March 25, Ríos interpreted the election results as meaning that the nation was tired of having political quarrels placed before the national welfare. Asserting the power of the executive, he also outlined policies to maintain democracy and continental unity; a \$22,000,000 public works plan; an \$18,000,000 agrarian plan; an \$8,000,000 housing plan; establishment of a steel industry and other developmental projects. These were apparently intended to take up the slack in employment expected at the end of the wartime demand for copper and nitrates. For the same reason, Chile was interested in the announcement on April 3 that the United States Department of State had promised during the Inter-American Conference on Problems of War and Peace in Mexico City that United States synthetic nitrate plants would not compete with the Chilean industry after the war but would be maintained only for national security.

On April 12, Chile declared war on Japan.

On April 20, Ríos began conferring with party leaders, with a view to forming a political cabinet in place of the non-political one then in office. He offered five ministries to the Radical party, three to the Liberals, one to the Democrats and one to the Agrarians; this would have meant a shift to the right. In a letter to Radical leader Alfredo Rosende, Ríos said: "I only want to ask this grouping for the better solution of the problems which seriously affect the nation." He also outlined a 23-point program which emphasized postwar problems of inflation, public works, industrialization, agricultural development, production, credit, and housing. Negotiations went on for several days but were abandoned on May 1. Ríos's explanation of his failure to form a political

cabinet blamed it largely on the demands of the Liberal and Radical Parties. He added that whatever solution was reached would be taken in accordance with the Constitution, and that the Government would carry out its program legally.

Ríos tried again a few days later and on May 14 a cabinet was sworn in composed chiefly of moderate leftists. The President had attempted to include rightist representatives but they had been unwilling to participate. Five Ministers, including Foreign Minister Fernández and Defense Minister Carrasco, were held over from the previous Cabinet, and the Radical, Socialist, Democratic and Falange Parties were represented. Addressing the opening of Congress on May 21, Ríos said the new Cabinet represented the best possibility of giving voice to the "largest possible political cohesion" under existing circumstances, and he urged that partisan struggles be postponed and expressed optimism over the economic outlook.

The rightists won an advantage when Congress was organized: former President Arturo Alessandri, Liberal, was elected president of the Senate, while Juan Antonio Coloma, Conservative, was chosen to head the Chamber.

Ríos's struggle with the rightist-dominated legislature continued throughout the year. On July 17 he stated that both chambers of Congress had recently infringed upon presidential powers, and "respectfully but firmly" proposed that the legislative and executive branches operate strictly within their constitutional limits. And on August 1, he issued a manifesto "defining concepts on the constitutional scope" of the powers exercised by both chambers of Congress with respect to acts of the executive. This public statement reiterated his note to those bodies on July 17 in which he had indicated that it would be desirable to delimit their constitutional rights in the legislative and fiscal fields. He added that there were new arguments which "oblige me to maintain, with the strongest conviction, my intention of upholding my constitutional interpretation."

The Finance Minister announced on August 30 that the 1946 calendar year budget would total approximately \$259,585,402, with a deficit of \$31,500,000.

Another Cabinet crisis arose in September, on the eve of Ríos's departure for the United States, on an invitation issued by the late President Roosevelt and repeated by President Truman. Under the Constitution, Interior Minister Luis Alamos Barros would serve as Acting President during Ríos's absence, but rightist party leaders opposed him. On September 20 the entire Cabinet resigned to give the President a free hand to appoint a substitute. He asked them to remain at their posts until he had reached a decision. The crisis was solved when Alamos Barros resigned, and Alfredo Duhalde Vazquez took his place as Interior Minister. Duhalde became Acting President when Ríos left on his tour, which took him to a number of other American republics, as well as the United States, on September 28.

During the President's absence, the strike situation, which had been bad all year, became acute. In October, 7,500 workers walked out at the Chuquicamata plant of the Anaconda Copper Co., demanding higher wages and other concessions. Then 5,000 miners at Anaconda's Potrerillos plant staged a sympathy strike, as did 14,500 coal miners, thousands of nitrate workers, and explosive workers in the Loa Valley. The workers rejected an arbitration award, whereupon the Gov-

ernment declared the strike illegal and ordered them back to work. When they ignored the ultimatum, the Government declared the province of Antofagasta an emergency zone; 26 labor leaders were arrested and others went into hiding. A settlement was finally reached, but other strikes, in increasing numbers, broke out during the rest of the year.

Ríos returned home from his six-week trip on November 25 and at once found himself in the middle of another quarrel with the rightist-dominated congress. During his absence, the Chamber of Deputies, voting on strictly party lines, had impeached the Comptroller General, Agustín Vigorena, for alleged laxity in office. Leftists unanimously labeled the impeachment bill a political attack on the Government. Ríos took this view, calling the trial "the most serious act this republic has experienced since the revolution of 1891." "Should the Senate approve the bill," he declared, "it would signify confusion and disorganization in Chile's public administration." But on Dec. 19, the Senate voted impeachment of Vigorena by 23 to 21. It was a hard blow at the embattled Ríos Government.

HARRY B. MURKLAND.

CHINA. A republic in eastern Asia. Capital: Nanking (after V-J Day, Sept. 2, 1945, the Government started to move back the various ministries to Nanking from Chungking, the provisional capital).

Area. Including Formosa but excluding Outer Mongolia, the total area of the Republic of China and its dependencies amounted to 3,975,000 square miles (estimated) of which China proper accounted for 3,263,000 (including Formosa and Kwangchowan).

Population. The estimated population of China, including Formosa and Kwangchowan but excluding Outer Mongolia, was 445,250,000 (based on 1940 figures). For the estimated populations of the provinces of China see YEAR BOOK for 1941, p. 118. Chief cities (with estimated prewar population figures): Shanghai 3,490,000, Peiping 1,556,000, Tientsin 1,292,000, Nanking 1,020,000, Tsingtao 515,000, Canton 861,000, Hankow (including Wuchang and Hanyang) 778,000, Chungking 635,000, Wenchow 631,000, Changsha 607,000, Hangchow 607,000, Weihaiwei 390,000, Foochow 323,000, Soochow 260,000, Amoy 234,000, Ningpo 219,000, Wanhhsien 202,000.

Education. According to available figures in 1941-42 there were 232,145 primary schools and 19,490,000 pupils, 2,606 secondary and vocational schools and 768,530 pupils, and 132 institutions of higher education with a total of 57,853 students.

Religion. With the exception of Christians and Mohammedans, most Chinese practise and profess all three indigenous or adopted religions—Confucianism, Buddhism, and Taoism. The Mohammedans are estimated at over 48,000,000. In 1934 there were 2,623,560 native Roman Catholics and 123 Catholic missions, with a staff of 16,241. The Protestant churches, with 1,130 mission stations and 488,539 communicants in 1932, had 19 colleges, 267 middle schools, and 37,714 students in 1934. The number of Christian missionaries in China declined from nearly 6,000 in 1937 to about 3,600 on June 30, 1941.

Production. In 1945 the estimated output from China proper of cleaned rice was 39,500,000 metric tons, wheat 18,865,000 metric tons. During prewar years, China was the world's leading producer of rice, soybeans, tea, kaoliang, sweet po-

tatoes, millet, and vegetable oils; it ranked second in the output of raw silk and wheat; third in cotton, and was an important producer of corn, tobacco, fruits, vegetables, and cane sugar, as well as being the chief exporter of eggs and tung oil. Wool and mohair are important products.

The principal mineral products of China include coal, antimony, tin, tungsten ore, white alum, arsenic, coke, copper ore, gold, gypsum, iron ore, pig iron, lead ore, crude petroleum, potash, quicksilver, rock and refined salt.

China's rapidly expanding manufacturing industry was disrupted by the war with Japan which started in 1937, but there was a considerable transfer of plants to the free provinces in the west. On June 30, 1944, Free China had a total of 4,346 factories registered with the Ministry of Economic Affairs.

Foreign Trade. In 1943, exclusive of bullion, imports were valued at CN\$3,314,324,000; exports, CN\$164,459,000. The value of the Chinese National dollar (CN\$) was set at US\$0.05 on July 10, 1942. Of the total imports, the United States sent commodities valued at CN\$590,806,000, Great Britain CN\$198,577,000, British India CN\$77,374,000. Of the exports, the U.S.S.R. took commodities valued at CN\$58,705,000, United States CN\$37,007,000, and British India CN\$8,403,000.

Imports in 1943 included dyes, pigments, paints, varnishes, books, maps, paper, wood pulp, cotton piece goods, chemicals, raw cotton, cotton yarn and thread, metals and ores, and armaments. The principal exports included animals and animal products, oils, wax, textile fibers, spices, fuel, stone, tea, raw silk, leather, chemicals, metals, minerals, piece goods, paper, cereals, and beans.

Transportation. Highways traverse China in all directions and internal trade is carried on partly over them and in part over the many canals and rivers. In 1943 there were 78,580 miles of roads in all China. Before the war there were 12,500 miles of railway. Telegraph lines in 1943 had a length of 59,275 miles. In the same year telephone lines had a length of 41,384 miles. A network of 4,500 miles of navigable inland waterways and a new canal linking Shanghai, Peiping, and Nanking are included in a 5-year reconstruction plan announced, on Dec. 16, 1945, by the Chinese National Reconstruction Plan.

Government. The Organic Law of Oct. 4, 1928, revised Dec. 29, 1931, and Dec. 27, 1932, vested the supreme governing powers of the National Government of the Republic of China (inaugurated Oct. 10, 1928) in the National Congress of the Kuomintang (Nationalist Party), acting through the medium of the Central Executive Committee. On Sept. 10, 1943, the Organic Law was revised to provide for the selection and appointment of the President of the National Government and of State Councillors (from 24 to 36) by the Central Executive Committee. The head of the Government is chairman of the State Council. Included under the National Government are five yuan (branches or councils)—Executive, Legislative, Judicial, Examination, and Control. President of the National Government of China and Commander in Chief: Gen. Chiang Kai-shek (elected Sept. 13, 1943; assumed office, Oct. 10, 1943, for a three-year term).

Following the outbreak of war with Japan in 1937 a Supreme National Defense Council (headed by Chiang Kai-shek) assumed direction of all political and military affairs. It included the heads of all party, political, and military organs together

with other members who were nominated by the chairman and approved by the Council.

The Cabinet ministers at the beginning of 1945 were: President of the Executive Yuan—T. V. Soong (Sung Tze-wen); Interior—Chang Li-sheng; Foreign Affairs—T. V. Soong (Sung Tze-wen); Military Affairs—Chen Cheng; Finance—O. K. Yai (Yu Hung-chun); Economic Affairs—Wong Wen-hao; Education—Dr. Chu Chia-hua; Communications—Tseng Yang-fu; Agriculture and Forestry—Adm. Shen Hung-lieh; Social Affairs—Ku Cheng-kang; Food—Hsu Kan; Justice—Dr. Hsieh Kwan-sheng (Sie Kuan-sheng); Overseas China Affairs—Liang Han-chao; Organization—Chen Li-fu; Information—Wang Shih-chieh. See *Events*.

Events, 1945. While the end of 1944 saw China facing her greatest military and economic crisis, the year 1945 saw the country stage a military comeback, prior to Japan's capitulation, which was nothing short of startling. The situation at the end of 1944 was so depressing as to be described by the widely-known writer and authority on China, Pearl Buck, as "China's darkest hour." Secretary of the Navy Forrestal declared at the same time that it would be practically impossible to send sufficient aid to China over the Burma-Ledo roads to save the situation and expressed the opinion that conditions would continue "hopeless until a port could be opened on the China coast through which large quantities of supplies for both military and civilian use could be transported."

Loss of American Airfields. Pessimism in American military circles was due to the loss, in 1944, to the Japanese, of practically a dozen airfields, constructed at great cost of money and manpower, from which it had been hoped that Japan's military set-up on the Continent, as well as on the main islands of Japan could be bombed. Aside from the Japanese penetration of the Chinese provinces of Anhwei, Kiangsi, Hunan, Kwangsi and Kwangtung, the Nipponese had also strengthened their position on the coast between Canton and Shanghai, usually referred to in the dispatches as the most likely areas to be invaded by American land and naval forces. Japan's object was obvious, to block any combined Chinese-American move to establish bases on the Continent from which Japan proper could be bombed.

Stilwell-Chiang Kai-shek Controversy. Japan's success in accomplishing her objective in 1944 was largely responsible for the controversy which developed between Generalissimo Chiang Kai-shek and Gen. Joseph Stilwell, Commander-in-Chief of American forces on the China-Burma-India front. As a result of the controversy, Gen. Stilwell was recalled to the United States on October 28, 1944. (See *YEAR BOOK* for 1944, p. 128.)

Although no official statement was issued from either American or Chinese sources, it was thought that the controversy between the Chinese and American military leaders resulted from profound differences concerning tactics in meeting the Japanese menace in South China. Gen. Stilwell had inaugurated the training and equipment of large Chinese forces in Burma and northern India, which operation absorbed most of the military equipment which was being sent to China by way of India under the Lend-Lease arrangement. On the other hand Generalissimo Chiang Kai-shek had urged that the major portion of Lend-Lease military supplies be sent directly to China over the Himalayan "hump" for the equipment of Chinese troops which were facing the Japanese south of the Yangtze. These troops were in need of arms because most of China's military supplies had been exhausted in

the long war, which began in China proper at Marco Polo Bridge, near Peiping, on July 7, 1937. Gen. Stilwell argued that the training of large Chinese forces for use in the recovery of northern Burma and the reopening of the Burma-Ledo road system, was urgently necessary. The "over-the-hump" air-transport service was incapable of both transporting sufficient supplies to re-equip large bodies of troops in China proper, and also keeping up the flow of supplies for the U. S. Fourteenth Air Force stationed in west and southwest China.

The controversy developed ramifications in China's domestic politics, when it became known that Gen. Stilwell had urged Generalissimo Chiang Kai-shek to withdraw a division of his best troops from Northwest China for use in blocking the Japanese advance on Chungking. The Generalissimo refused to take this action on account of his alleged fear that the Communist Army, which was in rebellion against the Kuomintang-supported Government at Chungking, would take advantage of the situation to engineer a coup d'etat and seize supreme power.

Developments in 1945 (first in northern Burma, where the combined Chinese-American forces, with British-Indian assistance, were uniformly successful; and second, in South China where re-outfitted Chinese troops reoccupied American airbases) indicated that both American and Chinese military leaders had been correct in their main contentions, although differing as to method. It was reported at Chungking on August 8, that General Stilwell had been awarded the "Blue Sky and White Sun" medal, highest Chinese military decoration. The only other foreigner holding the medal is Gen. Claire L. Chennault, former commander of the U. S. Fourteenth Air Corps, based at Kunming. However, Gen. Stilwell announced that he would not accept any decorations from foreign governments.

Generalissimo Chiang Kai-shek made a statement on July 19 in the course of an interview with the correspondent of *Yank*, the U. S. Army newspaper, to the effect that a huge American land offensive on the Continent "would not be necessary in order to defeat Japan." General Chiang said, "Given proper equipment and supplies, the Chinese Army—together with a strong American air force—can defeat Japan on the Continent." Referring to the relative merits of American and Chinese soldiers, General Chiang said, "The American soldier is much better equipped, . . . but the point I wish to bring out is that where it takes \$10 for one American soldier, only \$1 is necessary for ours. . . . We must remember that the Chinese soldier is fighting in his own homeland where he knows the topography better than anyone else . . . he is more suitable to the climate and conditions of fighting; therefore to send American troops where we can employ Chinese troops is not very logical. . . ."

A significant report was issued by Gen. Albert C. Wedemeyer (successor to Stilwell), Commander of American troops in China, on June 29, to the effect that the American Army had flown some 40,000 Chinese troops from Sian, capital of Shensi Province, where they were facing the Chinese Communists, to southeastern China, where they were successful in repelling a strong Japanese force which was driving on Chungking, and later, when they were reinforced with further American-trained Chinese troops from Burma, repelled another strong Japanese force which was moving on Kunming. These actions took place in the late fall of 1944, but had not been made public due to possible repercussions in Chinese domestic politics,

and to the further allegation that General Chiang's refusal to take this action had been responsible for the break with Gen. Stilwell. Gen. Wedemeyer declared that the Chinese armies could be counted on for valuable contributions and stated further that reports published in the United States, alleging that Chinese "war-lords" had hoarded American Lend-Lease materials for the purpose of prosecuting postwar civil conflicts, were entirely false. Gen. Wedemeyer also quoted the Chinese Generalissimo concerning the falsity of such charges which had been spread in the United States by writers sympathetic to the Chinese Communists. In an article published in *Collier's*, Gen. Wedemeyer took serious issue with those who had been criticizing Generalissimo Chiang Kai-shek's conduct of the war and declared, "From what I have seen, I have no hesitation in saying that the Chinese have fought, are fighting, and will keep on fighting until Japan's complete defeat."

Reorganization of the Chinese Army. The reorganization of the Chinese Army reached the point, by mid-year 1945, where some three divisions had been completely equipped with American arms and materiel, according to a radio report from Chungking. An earlier report (Feb. 21) stated that it had been decided to reduce the size of the army by one-third; that many superfluous military organizations would be discontinued, and the scale of pay for both officers and men would be increased from 25 to 500 per cent. The Chungking broadcast stated that under the new scale a full general would receive \$20,000 (Chinese) a month; a colonel \$14,000; a major \$10,000; a captain \$8,000; a lieutenant \$5,000; and enlisted men from \$300 to \$600. The Chinese exchange rate at that time was, US \$1.00 equivalent to Ch. \$500. Some idea of the physical condition of Chinese troops due to inadequate food and medical service was indicated in a statement by Gen. Wedemeyer, that out of a particular group of 60,000 men, some 23,000 were found to be unfit for service. A report from Chungking, through *Reuter* service on July 31, stated that the Sixth Kuomintang Congress had passed a resolution ordering the abolition of all Kuomintang headquarters or so-called "political" agents attached to the various armies.

Chinese War Casualties Heavy. Gen. Chen Cheng, Chinese War Minister, stated on April 25 that China's military casualties from the outbreak of war in July, 1937, to March, 1945, were 3,100,000. An earlier report, March 10, stated that Chinese casualties on the Yunnan-Burma front alone from Oct. 31, 1943 through Feb. 28, 1945, totalled 85,420, of which number 31,602 were killed, 49,731 wounded and 4,087 missing.

Military Situation, January, 1945. According to reports from Chungking (A. P. & U. P.), throughout the last quarter of 1944 and the early months of 1945, the Japanese Navy was busily reinforcing its garrisons at Swatow, Amoy, Foochow, Wenchow, and Hangchow; the last named port being of special strategic importance since it is located at the head of Hangchow Bay and commands the only railway connecting Shanghai with the south-central provinces of Chekiang, Kiangsi, and Hunan, and thence southward through Kwangtung to Canton. Possession of this railway by an invading force landing on Hangchow Bay, would enable a coastal link-up with American and Allied forces in southwest China, Indo-China, and Burma.

Japan's determination to block an Allied landing on the Continent was evidenced in a desperate attempt to establish control over the entire 685-mile Hankow-Canton Railway. By the end of January, the Japanese had all of this important line, with the exception of about 20 miles lying within southern Hunan Province. They had accomplished this by moving south from their major Central China base at Hankow, and northward from their South China base at Canton. Japan's major objective was to open an all-land route southward from Manchuria,

through China to Indo-China and ultimately to Singapore and Burma (See YEAR BOOK for 1944, p. 126). American efforts to hold up the Japanese advance were indicated in a report, on January 30, stating that the Fourteenth U. S. Air Force had destroyed more than 800 Japanese locomotives and had blown up 34 bridges and two tunnels on Japanese-operated lines in China. American Liberators also destroyed docks and warehouses and started disastrous fires at the Japanese base at Hankow.

Japanese Take Canton-Hankow R. R. All attempts to block the Japanese advance were futile, however, as the Japanese succeeded early in February in occupying the entire Canton-Hankow Railway. Shaokwan, the last Chinese stronghold about 75 miles north of Canton, was occupied by the Japanese on Jan. 31.

The Japanese occupation of a railway corridor running through interior China from Hankow to Canton, had the effect of isolating several advanced American air-bases east of the railway. Among these were Suichwan in Kiangsi and Kukong in Kwangtung. It was reported that the Japanese were also making preparations to attack Kweilin, in northern Kwangsi, the most important American air-base in southwestern China besides Kunming. During the attack the Chinese defenders fought with suicidal bravery but were overwhelmed by better-armed Japanese troops. The Japanese were reported to have more than 300,000 troops in central and southern China, with additional reserve units estimated at 200,000 on the islands of Formosa and Hainan. However, the Chinese still had important, though poorly armed troops in the extensive area east of the railway and south of Hangchow Bay.

Japanese Seize Wolfram Center. The Chinese High Command announced on Feb. 6 that the Japanese had occupied Tayu in southern Kiangsi Province and Namying in Kwangtung Province, which, aside from being important U. S. air-bases, were America's chief sources outside of the United States of the important metal, wolfram, necessary in the production of steel. Large quantities of the metal had been flown to the United States. The Japanese also captured Kanhsien, or Kanchow, in Kiangsi Province, another Allied air-base. Maj. Gen. Wedemeyer stated on Feb. 8 that the American and Allied successes in the Philippines and Burma were responsible for Japanese action in stepping up their defense measures in order to block landings on the South China or Indo-China coast. The Japanese had also greatly strengthened their forces on Formosa, where they reportedly had eleven divisions and in addition had constructed twenty-six air bases. Most of the Japanese construction work was being accomplished by thousands of Chinese coolies in forced-labor gangs. The Japanese charged that the Americans were developing bases for Superfortresses at Sian and Lanchow in Northwest China, and at Kweilin in the south.

The Fourteenth U. S. Airforce reported that 334 Japanese aircraft had been destroyed in January, 1945, and that the total of enemy planes destroyed in the China sector since July 4, 1942, had reached 1,255, with an additional 554 probably destroyed. In addition fifteen Japanese ships, with a total tonnage of 13,500 plus eighty-nine smaller river and coastal craft were also destroyed in January, bringing the grand total of enemy shipping sunk, since July 4, 1942, to 409 ships sunk and 169 probably sunk, and 2,961 smaller craft, the total tonnage sunk being 1,950,000. Thirty-two Japanese naval vessels were sunk, twenty damaged, and more than 10,000 craft of less than 100 tons were destroyed.

The Japanese countered in February-March with the capture of a further American air base, at Sincheng, in Kiangsi Province, which had been completed only nine days and was capable of accommodating B-29's. American engineers blew up the runways before evacuating. The Japanese claimed that the capture of the Sincheng base had completely eliminated all Allied air-fields in the Kanhsien-Suichwan area of China. Late in March the Japanese launched a determined drive on the Chinese-held American air bases at Laohokow in Hupeh Province and Nanyang in Honan. Laohokow had long been a thorn in the side of the Japanese as American fliers, operating from this field, had wrought havoc on Japanese communications, especially the Peiping-Hankow and Lung-Hai railways. The Japanese sent three divisions, supported by planes, against the city. The Americans evacuated the base on March 30, after blowing up the runways.

American Armament Being Felt. The fact that American arms and munitions were beginning to arrive in sufficient quantities to enable the Chinese to put up stronger resistance, was indicated in the Chinese defense of Laohokow and Nanyang where some 800 Japanese were killed, and the commanding officer, Lt. Gen. Okua was severely wounded. The rifles, trench-mortars and munitions were flown to Honan on American planes. In addition the

U.S. Fourteenth Airforce had assisted materially by bombing and strafing Japanese lines of communications throughout Honan and east China, extending as far as the coastal ports of Tsingtao and Shanghai, and including the important Japanese bases at Loyang and Kaifeng on the Yellow River.

That the tide was beginning to turn was indicated in Japanese reports early in April that a Chinese offensive was in the making, in which Generalissimo Chiang Kai-shek's newly armed troops with American officers in an "advisory" capacity, would occupy the spearhead. Main dependence, it was reported, was being placed on the Chinese Army, which had been American trained, armed, munitioned and equipped in India and had received practical experience in operations against the Japanese in northern Burma. Most of these troops had been flown "over the hump" of the Himalayas by American planes. The number of troops in the new army was not announced, but correspondents reported its strength as three divisions.

A report by the Central News Agency from Chungking on April 2 stated that the Chinese Army had opened attacks on strong Japanese positions guarding the Hankow-Canton Railway "corridor." The Japanese corridor south of the Yangtze, at the high point of Japanese successes, embraced an irregularly-shaped area resembling a shoe, with the narrow ankle in northern Hunan in the Tungting Lake district; the heel planted on the coast at Hongkong and Canton and the toe resting on the coast along the Gulf of Tongking and extending into French Indo-China. The narrowest part at the "ankle" in northern Hunan, south of Hunan, south of Hankow, was only about 100 miles wide, but the widest portion, resembling the "foot," or "sole" of the shoe, extending more than 600 miles from east to west, was in Kiangsi, Hunan, Kwangsi and Kwangtung. Since the Japanese were already in occupation of the Yangtze Valley, which they had taken over in 1937, they therefore controlled the all-important "rice-bowl" or food-producing areas of the country, where rice is the principal diet. Embraced within this territory were the important Chinese cities of Hankow-Hanyang-Wuchang (popularly known as the "Pittsburgh" of Asia) located on the mid-Yangtze, Ichang, which marked the most western point of Japanese penetration; Nanchang and Changsha, important railway and shipping centers; Siangsiang, Paoking, Hengyang, Chuanhsien, Kweilin, Nankang, Kanhsien, Kiennang, Kukong, Tungnan, Hoyun, Liuchow, Luchen, Vining, all located in Hunan, Kiangsi, and Kwangsi provinces where main or auxiliary American air bases had been located. This left the Chinese Government in more or less precarious hold of a broad indefinite territory to the east embracing parts of Hunan, Kiangsi, Kwangtung, Fukien, Anhwei and Chekiang provinces.

Chinese pressure against the Japanese corridor was strongest at Kweilin, Liucheng and Liuchow on the west and in northern Kwangtung, and western Kiangsi on the east side.

In addition the Chinese had launched a determined drive against Japanese positions in the so-called "invasion" zone of the coastal provinces in Fukien and Chekiang provinces.

Early in April there also was mentioned the increasingly important activities of the Chinese Air Corps, consisting chiefly of Chinese aviators who received their training in the United States. A report on April 2 by Maj. Gen. Claire L. Chennault, commander of the Fourteenth Air Force,

stated that Chinese airmen had bombed Japanese headquarters on the Han River in northwest Hupeh Province and had strafed tank, truck, and troop lines. Chinese planes also attacked the Japanese who were besieging Laohokow, killing many of them. Laohokow was entered by the Japanese on April 10. The Chinese High Command at Chungking reported that the Japanese had lost more than 5,000 killed in the fighting in Honan, and it was hoped that the Japanese threat of an invasion of Shensi Province and even Chungking itself had been frustrated. The U. S. Fourteenth Air Force gave the Chinese strong support in their drive against the Japanese on the Honan-Hupeh sector. Chief Japanese objective in the drive on Shensi, was the American air base at Sian, second most important in China.

General Counter-Offensive. South of the Yangtze, Chinese troops with the help of the U. S. Fourteenth Air Force, blocked another Japanese drive, also pointing toward Chungking, the Chinese wartime capital. The A. P. correspondent called the action, "prelude to a general Chinese counter-offensive," and said that the Japanese were using some 80,000 men in an attempt to capture another important American air base, located at the town of Chihkiang, in Hunan Province. The Japanese had already occupied another American base at Paoking (also spelled Paoching), about 125 miles east of Chihkiang; however the value of Paoking to the Japanese was destroyed by the Fourteenth Air Force which dropped 100 tons of explosives, immediately following the Japanese occupation. It was here that the Chinese used troops which previously had been stationed in Shensi, and were flown to Central China to block the Japanese drive on Chungking. The forces were commanded by Gen. Hu Tsung-nan, one of Generalissimo Chiang's most trusted commanders. Severe fighting also occurred at Wukang, Sinning, Tungkow, and Taohwaping. Chinese reports claimed that a third of the Japanese had been killed or wounded, the killed being estimated at about 6,000. Japanese forces used in this engagement included the 13th, 38th, 68th, and 116th divisions.

According to Gen. Chen Cheng, Chungking War Minister, chief credit for the Chinese victory went to Lt. Gen. Wang Yao-wu, a veteran of both the Shanghai and Nanking battles in 1937.

While these actions were taking place in Central China another Chinese force captured an air base south of Foochow and launched an attack on that city, important port in Fukien Province and long regarded as a possible landing point for Allied troops. The renewal of Chinese military activity along the coast south of Hangchow Bay led to reports that the Japanese had begun a withdrawal from interior South China (excepting the Hankow-Canton corridor) in order to strengthen their position about Hangchow Bay and the Shanghai-Hangchow-Nanking triangle.

U. S. Transport Convoy Sent to China. Interest in the military developments south of the Yangtze was increased by the arrival in Chungking of Lt. Gen. Raymond A. Wheeler, deputy supreme commander of the Southeast Asia Command. Following his arrival there were important conferences at Chungking participated in by Generalissimo Chiang Kai-shek, Gen. Albert C. Wedemeyer, Commander-in-Chief of American forces in China, and Lt. Gen. Daniel C. Sultan, U. S. Army Commander in the India-Burma sector. Shortly following the Chungking conversations it was announced that U. S. service troops, in a huge truck convoy, had been moved to the Burma-China sector from

the Persian Gulf sector, where they had been assisting the Russians by transporting large quantities of American supplies from Persian Gulf ports to the Black Sea area where they were taken over by the Soviet Russians. The convoy forces were commanded by Col. Paul R. Guthrie of Denver. The convoy and its extensive equipment were transported from Iran to Calcutta by sea, and from Calcutta to the Ledo terminus of the Stilwell Road by cars of the Indian National Railways, and from Ledo it rolled under its own power over the reopened highway to Kunming.

Japanese Losses Heavy. Maj. Gen. Robert McClure, commanding officer of the Chinese Combat Command, estimated on May 14 that the Japanese veteran Sixteenth Division had lost about half its strength in the Hunan fighting and that Japanese casualties numbered about 11,000. Gen. Chiang Kai-shek, on May 14 issued an order commending the U. S. Fourteenth Air Force and the Chinese Air Force for their fine record in the Hunan campaign.

The Chinese High Command at Chungking announced on May 27 the capture of the strategically-important center of Nanning, thus cutting the Japanese highway connecting the French Indo-China border town of Langson with the Kwangsi rail junction city of Luichow. Nanning is in southern Kwangsi the head of navigation on the Si (West) River, flowing some 430 miles eastward to Canton. It is about 470 miles south of Chungking, and since it was located at the southern end of Japan's "dream" transcontinental avenue from Manchuria to Indo-China Thailand and Burma, its capture seriously embarrassed the Japanese in their grandiose continental plans. Nanning had also served previously as an American air base. Gen. Chang Fa-kwei, veteran leader of the famous Chinese "Ironsides" or Fourth Nationalist Army, received chief credit for the recapture of Nanning.

A summary of the military situation by the correspondent of the Associated Press at the end of May stated that there was increasing evidence of Japan's withdrawal from South China, with the exception of the important bases of Canton and Hongkong, and the all-important rail-corridor connecting Hankow and Canton, which the Japanese required for evacuation. Important Chinese centers still held by the Japanese at the end of May, several of which had previously served as American air bases, included, Ichang, Wuchang and Nanchang on the south bank of the Yangtze, held by the Japanese since 1937-38, Changteh, Changhsia, Hengyang, Shaoyang, Kweilin, Ishan, Luichow, Canton, on the Hankow-Canton railway or its branches in southwest China. Luichow and Mengshan were recaptured by the Chinese forces on June 6, forcing a Japanese withdrawal along a 100-mile front on the western side of the Hankow-Canton corridor. The Chinese Army spokesman in Chungking claimed that the capture of Luichow, plus the earlier severance of the Japanese corridor into Indo-China had isolated some 200,000 Japanese troops in southeast Asia.

Coastal Advance Keeps Pace. Reports from Chungking in July indicated that the campaign to clear China's coastal areas of enemy troops was keeping pace with efforts of other Chinese armies in western or Free China to eliminate the enemy on that front. According to a map based on Associated Press reports, published in the *New York Times* on July 8, Japanese troops had been withdrawn from practically all of the coastal regions, beginning at Bias Bay, east of Hongkong, nearly to Hangchow Bay, about 100 miles to the south of Shanghai. In addition to the withdrawal from the coast regions, the Japanese also had withdrawn from the interior areas of Kwangtung, Fukien, Kiangsi, southern Anhwei and southern Chekiang. This meant that the coastal ports of Swatow, Amoy, Foochow and Wenchow were in Chinese hands, and the same applied to interior cities of the aforementioned provinces. In addition to the areas between Hongkong and Shanghai, known as "invasion" territory, the Chinese armies had also cleared a large section of Kwangtung Province west of Hongkong and extending to the French Concession district of Kwangchowwan, north of Hainan Island.

On the western side of the "corridor" the Chinese had cleared nearly all of Kwangsi Province of the invaders, and were investing Kanchien and Kweilin, important cities which had served as America's second most important air base, south of the Yangtze. Further south, the Chinese had captured Chennankwan on the border of French Indo-China and were advancing toward the town of Dong Dang on the historic route to Hanoi, capital of Indo-China. Kweilin, with its three American air bases was captured by the Chinese on July 28.

Japanese Air Force Also Withdrawn. Gen. Claire L. Chennault, commander of American air forces in China and also of the Chinese "wing" composed of American-trained Chinese fliers, announced on July 11 that the Japanese air force had also been withdrawn from interior China and that American fliers enjoyed air supremacy in practically all battle sectors of the Continent and of the Pacific war generally. In achieving this "first objective," Gen. Chennault stated that the U. S. Fourteenth Air Force had destroyed more than 2,000 enemy planes in the air and on the ground and had hit more than 2,000,000 tons of Japanese shipping. He said that the main function of American fliers now was to support Chinese ground forces, strafing Japanese lines, bombing supply dumps and disrupting communication lines. He stated that the destruction of Japanese shipping had reduced the Japanese to the point where they could only maintain communications with their forces in Indo-China by means of small vessels and Chinese junks which operated close to the coast at night. He declared that the Japanese were in "bad shape" and "might surrender at any time."

With reference to Japanese communication lines, Gen. Chennault stated that American aviators had destroyed 43 enemy locomotives and had damaged 499 others, and had destroyed or damaged 189 bridges.

Japanese Barbarism. David Chandler, correspondent for the U.S. Office of War Information, stationed in China, said that the Japanese had killed 50,000 Chinese civilians in the Kanhsien area, some 240 miles north of Hongkong. He declared they had slaughtered most of the inhabitants of the region during a six-months occupation of the district. With reference to Kweilin, the once beautiful capital of Kwangsi Province, Mr. Chandler said the Japanese had sacked the city "as utterly as the Romans sacked Carthage." The city previously had a population of 500,000, but was ravaged with a fury comparable with the Nazi action at Coventry, Rotterdam, and Lidice. Kweilin, when reoccupied by Chinese forces was only a vast heap of rubble, stated the OWI correspondent, who reported that for twenty days prior to their withdrawal the Japanese systematically looted and demolished practically every building in the city and even the trees along the streets were chopped down and burned. An AP dispatch from Chungking on August 5 stated that the Japanese had killed 1,000 civilian residents of Ichang on the Yangtze, most of them being killed by "poisonous injections," presumably as a preventative against an outbreak of meningitis.

Headquarters Moved to Kunming. As a result of the new development in the Chinese military situation and the speeding up of deliveries of arms and munitions in the Southwest over the Burma-Ledo roads and the over-the-hump air service, Generalissimo Chiang Kai-shek in February said that the general headquarters for Chinese ground troops had been established at Kunming. The change reflected the change which had taken place in China's long struggle to oust the Japanese from their soil, and also reflected the improvement which had taken place, after almost super-human effort to circumvent the Japanese blockade of China's coast, through the construction of the Burma-Ledo roads, the India-China pipeline and the Himalayan air service.

Hanson W. Baldwin, military strategist of the *New York Times* (July 6), in the course of an analysis of the military situation, said that the "contribution of China to the common cause should not be underestimated. China's belligerency, even though often passively expressed, has tied down a very sizable portion of Japan's army in China and China's guerrillas and regulars—and now her fliers—have added to the constant strain of attrition to which the enemy has been subjected. China has served as a base for our planes, and the refusal of Chungking and Yenan to make terms with Japan has won the admiration of the world and

bolstered the spirit of all the peoples of the East who stood against aggression. . . . China after eight years of war has passed from desperation to the certainty of Japanese defeat. The Japanese retirement from interior China, particularly marked in South China, implies an abandonment of all except vital nodal areas. . . . It seems that the Japanese will attempt to hold the Hongkong-Canton area, the Shanghai area and the north China ports."

China's American-trained Army. Mr. Baldwin attributed much of the favorable turn in China's military situation to the efficiency of China's new army which had been trained at Ramgarh, India, first under the supervision of Gen. Joseph W. Stilwell. This army fought first in northern Burma and then was transferred to China and now was rated as China's best fighting force. After the departure of Gen. Stilwell, the training program was taken over and expanded by Gen. Wedemeyer. According to Mr. Baldwin, the Chinese Training Center, largely staffed with American officers and men, many of them veterans from other war theaters, has six principal training schools, general staff school—a small and simplified edition of our Leavenworth—an infantry-training center, field artillery school, automotive school for drivers and mechanics, Chinese ordnance training center and an interpreters' pool.

The carrying out of reforms in the Chinese Army received the enthusiastic support of both Generalissimo Chiang Kai-shek and Gen. Chen Cheng, War Minister, who arranged for improved rations, pay increases and the creation of a new Ministry of Conscription. Of greatest importance, the Chinese military headquarters, for the first time was able to obtain the enlistment and enthusiastic support of thousands of students. A "join the army" movement resulted in the enlistment of 122,000 young Chinese men and women of secondary or college education, constituting the nucleus of a new Chinese "Youth Army." It was hoped that this group would constitute also the nucleus of a new Chinese army after the war. Although militarily weak and politically divided there were prospects of better conditions in the not too distant future.

Generalissimo Chiang and the Political Situation. Generalissimo Chiang Kai-shek, speaking on the eve of the eighth anniversary of China's war against Japan, declared "We should never forget the mass-slaughter of Nanking (1927) and other cities and the bestial bombing of Chungking. . . . We must follow the trail marked by the blood of the fallen and press the blows to hasten the enemy's doom." General Chiang estimated Japanese casualties on the mainland at 2,521,737 and total Chinese casualties at 3,178,063. Analyzing the figures he said that the Japanese had lost 1,179,774 killed and 1,318,670 wounded and 23,293 captured. Chinese casualties were given as 1,310,224 dead, 1,752,591 wounded and 115,248 missing.

Gen. Chiang's reference to China's newly-trained troops, increased supplies of more effective equipment, and preparations for a new offensive, combined with the fact that Japan had been forced by events in the Pacific to change her position on the Continent from an offensive to a defensive status, indicated unmistakably that China's military comeback played an important part in the decision of the Japanese to capitulate in August.

The People's Political Council at its July meeting adopted resolutions calling upon the Government to (1) improve food and nutrition for the fighting men; (2) arrange for better treatment of soldiers according to actual requirements and

living conditions of localities where they are stationed; (3) provide greater facilities for taking care of families of fallen warriors and erect shrines in honor of martyrs; (4) suppress corruption among fighting forces at the front; (5) improve equipment of the people's self-defense units in Honan, which had cooperated with the regular troops; (6) transfer some of the troops under training in Kansu to other points, and abolish unnecessary military organs.

Political and Economic Reorganization Still Lag. Neither Chinese political reform nor economic improvement kept pace with the improving military situation, according to numerous observers who visited the China front during the eight months of the year which preceded Japan's capitulation.

According to a survey of the China situation in August, just prior to the Japanese capitulation, the rapid increase in the flow of supplies over the Burma-Ledo road system, the India-China pipeline, and the over-the-hump air transport, was rapidly changing not only the military and production picture but the political line-up as well. Among the shifts in the political picture was the resignation of Dr. H. H. Kung as Finance Minister, and Gen. Ho Ying-chin as War Minister. Chen Li-fu, Minister of Education, also resigned. Wang Shih-chieh was appointed Minister of Information and Gen. Chen Cheng became Minister of War. Gen. Ho Ying-chin, former War Minister, became chief-of-staff at the new headquarters at Kunming, where he was assisted by Gen. Robert McClure of the U. S. Army. Generalissimo Chiang Kai-shek resigned his concurrent post of Premier, and T. V. Soong, who had served as Foreign Minister, stationed in Washington, became Premier in Chiang's place. Dr. H. H. Kung also resigned his concurrent post as Vice-Premier, and the place was taken over by Wong Wen Hao, who had served as the head of China's War Production Board, in which position he had been assisted by Donald Nelson, who went to China early in the year with instructions to help China increase her war production just as soon as the new materials began flowing in over the "hump." Chiang Monlin, well known liberal educator and former head of Peiping National University, was appointed Secretary-General of the Cabinet.

Among the political reforms put into effect, most important apparently, was the dropping of Kuomintang Party officials from both the schools and the army, and initiated a further revolutionary change in the nature of political training given students, an importation from Russia when communism was introduced from the U.S.S.R. in 1926-27.

Of greatest importance from the larger standpoint of political unification was the decision of the Kuomintang Congress in May to call a constitutional convention in November, with the object of initiating an elective democracy and the cutting off of the Kuomintang Party from government financial support. The Government also promised that district and provincial people's councils would be elected; that the mass literacy movement would be speeded up and expanded, as also would be the movements to stimulate local self-government and general political reform.

Fourth Political Council and Sixth Kuomintang Congress. The Chinese reference digest, *Contemporary China*, published in New York, contained summaries of two important conferences held in Chungking, which were concerned with governmental policy. The Fourth session of the People's

Political Council was held in July and was attended by 290 delegates, of which number 150 were elected by the provisional assemblies of the provinces and municipalities; 75 were selected from leading cultural and economic institutions; and 65 were chosen from various parties and organizations. The Communist Party was represented by eight members, the National Socialists by five, Youth Party, number not stated, while most of those elected by provincial and municipalities were non-partisan.

The President of the Council, Gen. Chiang Kai-shek, declared at the opening session that China's position in world affairs had been greatly enhanced during the eight years of war; that China was one of the Big Five in the United Nations; that China was striving to create closer cooperation among the United States, Great Britain, Soviet Russia, France and China. Gen. Chiang then informed the members that he had announced in January of this year that a National Assembly would be called to adopt and promulgate a constitution, thus ending the so-called period of "political tutelage." He also stated that when the Sixth Kuomintang Congress was held in May, a resolution was adopted calling for a meeting of the National Assembly. The resolution of approval contained four points:

1. Since the original date for the assembly of the National Constitutional Convention, Nov. 12, 1937, had to be postponed because of the Japanese invasion and the enforced removal of the Government from Nanking, the Council thought that the actual date should not be left open, although it was the consensus of opinion that it should not again be postponed.
2. Membership of the National Assembly or Convention, should have the fullest representation of all classes of people in the country. Since the members elected to the original Assembly, scheduled for 1937, had never met because of the war, and since an election could not be held in enemy-occupied territory, it was thought expedient for the original members to continue at the forthcoming Assembly, but more should be elected, so that all provinces could be fully represented. New delegates should be elected to replace those who had died or turned traitor.
3. When the new constitution has been adopted, the Council hopes constitutional government will be inaugurated as soon as possible.
4. Prior to the convocation of the National Assembly, the Government is to continue to employ all available political means for attaining national unity and solidarity; to insure freedom of opinion, of publication, of assembly, or organizing political societies; to enforce the Habeas Corpus Act; to recognize the legal status of various political parties; to complete the setting up of people's representative organs in all provinces of Free China in order to lay the foundations of local self-government.

Many of the members of the Council expressed anxiety regarding the future situation, due to the refusal of the Communists to participate in the meetings of the People's Council, and to the fact that efforts of the Government to reach a compromise remained at a deadlock. The Council called upon the Government to continue its efforts to settle the issue by political means. The Council then passed the following resolutions concerning domestic affairs:

County Government: The new county system should be carried out completely so as to achieve county autonomy and simplify county government; county representative organs should be established immediately in order to enable the people to supervise their county administrations.

Provincial Governments. Military and civil authorities in the provinces should be separated, and no military man should be permitted to hold concurrently the post of governor or member of the provincial government. Establishment of provincial assemblies should be completed as soon as possible.

Ministry of Interior. Powers of the Ministry of Interior should be increased in order to carry out reforms in internal affairs and eliminate corruption among

officialdom; civil service examinations should be broadened and strictly enforced.

Kuomintang National Congress. The sixth national congress of China's Kuomintang political party, the only legal party in the country, was held in Chungking from May 5 to May 21 and was attended by 731 delegates. Three subjects received major attention: (1) Intensification of the fighting effort by improving coordination of forces between front and rear, army and people, war and production, civil and military affairs; (2) Inauguration of constitutional government and promulgation of a constitution; (3) Improvement of the livelihood of the people through prevention of capitalistic monopolies, elimination of causes of class struggle, achievement of social security, elevation of living and cultural standards and creation of land equalization, inauguration of industrial reconstruction.

The Congress unanimously approved a resolution to call a National Assembly or Convention to adopt and promulgate a constitution. The chief problem concerned with the forthcoming meeting pertained to the election and status of delegates. Due to the impossibility of holding an election, with the enemy in control of much of the country's territory, particularly the industrialized areas of northern, eastern and southern China, it was decided to recognize the validity of delegates elected originally in 1937, with a condition that supplementary elections be held where possible in order to make the forthcoming meeting more fully representative. The original delegates were elected for the Constitutional Assembly called for 1937, but were unable to meet because of the Japanese invasion. Subsequently, the Japanese capitulation in August made it necessary to reconsider the action concerning election of delegates. The Congress adopted a six-point resolution, proposed by General Chiang Kai-shek, outlining revolutionary changes in party policy in preparation for the constitutional assembly:

1. All Kuomintang party headquarters in the armies to be abolished within three months
2. All Kuomintang party headquarters in the schools to be abolished and the Youth Corps in the schools (an organ of the Party) to be taken over by the Government as a youth-training institution.
3. That provisional political councils be established in all counties and municipalities in Free China (within six months) to serve as representative organs; where such councils are already in existence, a provisional provincial political council shall be elected immediately.
4. That laws be enacted governing formation of political societies, giving such groups (outside the Kuomintang) full legal status.
5. All offices of an administrative character, previously functioning under the Kuomintang Party, be taken over by the Government immediately.

On May 17, the Congress passed the following resolution concerning the communist problem:

1. The Congress endorses the policy of the Central Executive Committee in seeking a political solution of the communist problem. The Kuomintang Party continues its policy of working for China's freedom and equality and national unity, through a successful prosecution of the war.
2. The Communist Party, in 1937, at the beginning of the war, pledged itself to support the National Government and obey Government orders. Despite this, however, the Communist Party has persisted in armed insubordination, refused to carry out the military and administrative orders of the National Government. The Government, in the face of strong provocation has maintained a policy of forbearance and spared no effort to preserve national unity.
3. Since the National Constitutional Assembly has been called, for the purpose of inaugurating constitutional government, our efforts to consolidate national unity and insure victory over our efforts to seek a solution of the Communist problem, must be prosecuted with renewed vigor.

4. We hope that the Chinese Communists will not fail to appreciate the difficulties still confronting the nation and make good their pledges of September, 1937. We hold that the settlement of all questions can be reached through peaceful discussion without endangering the prosecution of the war to the end that an amicable settlement will be in the interest of the nation.

Further resolutions were passed concerning the inauguration of constitutional government and administrative matters, taxation, protection of freedom of speech, press, assembly, organization, religion and academic research; equality between the sexes as concerned with economic, social, political and educational activities; protection of unity and independence of judicial powers, simplification of legal procedure, prison reform, protection of the livelihood of prisoners who have served their terms; encouragement of labor organization; treatment of labor improved; cooperation of labor and capital; labor of women and children protected; social insurance, unemployment insurance and promotion of workers' health; employment of discharged soldiers and treatment of families of fallen soldiers; registration of private property of government employees and prohibition of government employees from engaging in private business; farmers' organizations to be encouraged and strengthened, collective farming encouraged, industrialization of agriculture hastened; lands in open places to be taken over by the Government, land ownership by the tillers to be encouraged and lands not cultivated by owners to be taken over by the state; international action to stabilize exchange value of Chinese currency; industries of a monopolistic nature to be operated by the state, others to be handled by private interests, with Government help if necessary; priorities to be granted for development of communications and electric power; Government to undertake program encouraging development of agriculture, textile industry, housing projects, roads, railways, waterways; private enterprises to be encouraged, foreign capital to be encouraged, foreign technical assistance to be welcomed.

Wedemeyer, Chennault, McClure, Nelson, and the Problem of Reconstruction. The American program to relieve China's "darkest hour" revolved about the activities of four men, Lt. Gen. Albert Coady Wedemeyer of Nebraska, Maj. Gen. Claire L. Chennault of Louisiana; Donald M. Nelson of Missouri, and Maj. Gen. Robert McClure, commander of U. S. land troops in China. Of the four, Chennault was more experienced in Chinese affairs as he helped organize and command the famous Flying Tigers, independent American air force which helped China against the Japanese long before the United States became involved in the war in the Orient. The Flying Tigers, later transformed into the Fourteenth Air Force of the United States Army, were the only American combat units in China. The others, numbering only a few thousand, served in innumerable useful capacities as military trainers, transport supervisors, liaison officers, technical assistants, constituting a sort of nervous system for a new Chinese Army. Many of these men actually fought alongside Chinese soldiers, but the responsibility for giving and executing orders rested entirely with the Chinese command.

The program involved utilization to the fullest possible extent of China's sole contact with the outside world, the reconstructed Burma-Ledo Road (renamed Stilwell Road), the India-Burma-China oil pipeline and the American Transport Command's air service over the "hump" of the Himalayas, and in addition the utilization for war

purposes of China's limited and badly crippled industrial establishment, operating old, broken and dilapidated machinery which had been transported inland from Shanghai, Hankow and other coastal and Yangtze Valley ports.

Donald Nelson's Proposal. Donald Nelson, who was sent to China early in the year to make a survey of China's productive capacity reported in May his conviction that China could replace the Japanese in the cheap textile trades by using American machinery and cheap power developed by harnessing the giant Yangtze River. He stated that Dr. John Savage, chief engineer of the U. S. Reclamation Service, regarded as one of the world's foremost hydroelectrical engineers, had reported, following an investigation, that the Yangtze Gorges, between Ichang and Chungking, could be converted into the largest hydroelectrical development in the world. Dr. Savage expressed the belief that the Yangtze Dam could produce 10,500,000 kilowatts a year, twice the present total of TVA, Grand Coulee, Boulder and Bonneville. He thought the production could be accomplished at a cost of \$100 a kilowatt installed as against a cost of American dams of around \$250 a kilowatt installed.

In Mr. Nelson's view, China should devote her immediate attention to the production of simple export items, for which she could receive quick cash returns, and the development of internal transport systems. He thought that the dreams of many of China's engineers concerning the production of airplanes, automobiles and heavy machinery could await the development of industries more immediately necessary. He thought that innumerable small industries could be put into production through joint ownership and operation, utilizing American assistance. Finally, Mr. Nelson recommended that a committee of five or seven practical American businessmen be sent to China to work out a program of economic cooperation between the two countries.

The Foreign Economic Administration in Washington reported on March 10 that it had worked out for China a five-year development program, which included both industrialization and transportation facilities. According to the program China would be provided with 953 industrial plants embracing mining and metallurgy, chemicals and basic processing, manufacture, power, transportation, production, processing and distribution of food, river control and irrigation and construction methods, industrial training and industrial hygiene, research and libraries of technical books. It was stated that the complete program, covering five years, would involve the expenditure of US\$1,000,000,000 for the industrial phase and an additional billion for transportation development. This FEA program had no connection with the recommendations of Donald Nelson.

Chinese Estimates. (For a complete account of China's postwar reconstruction program see *YEAR BOOK* for 1944, pp. 132-133.) Dr. Chi-ling Tung, vice-chairman of China's Foreign Trade Commission, stated in the course of a report issued in July that China's industrialization program for the first five years following the war would require the import of machinery and other materials totalling 3½ billion dollars in American currency. He stated that the reconstruction of China's transportation system, plus new construction would involve an expenditure of US\$1,500,000,000. This would include the building of 6,000 miles of new railways, to be added to the 9,000 odd miles already constructed but largely destroyed in the war. Included in the estimate were also motor roads,

motor equipment and vehicles and radio installations. Industrial equipment would include power plants, water works, flour mills, textile machinery, and machine tools. Other categories would include farm implements and fertilizers, medical supplies and chemicals, cotton and cotton goods, building materials, paper, paints, rubber and metals.

The Chinese hope that their expanded exports to other nations of raw materials and manufactured products will assist them in financing their entire program. Other plans for financing include foreign loans, invisible exports, increased domestic tax revenues. Among the items included in the export program are wood oil, used in the U. S. paint and varnish trade, of which China exported US\$26,000,000 in 1937. It also was thought that China might stage a "comeback" in her export of silk and silk products, due to the natural excellence of China's product, plus improved methods of conditioning for world markets.

A further item of export which China hopes to expand, following the war, is tin, now produced under primitive conditions in Yunnan Province. Chinese trade officials stated that large sums already had been expended in the United States for tin mining equipment, which would enable China to increase both the quantity and quality of her product. Another item which bulks large in China's export economy is hog-bristles, used for brushes. It was thought that improved standardization would enable the Chinese industry to compete with synthetic production abroad.

Chinese production of tungsten and antimony are expected to continue, despite the falling off of war requirements in occidental lands, due to the fact that production in China is far below costs in other lands.

Further items which bulk large in China's exports are embroidered cottons and linens, laces and embroideries, all of which are expected to be increased after the war. Gains also are expected in the export of Chinese skins and furs, feathers, and food products, including tea, eggs, sesame and other seeds, edible and industrial vegetable oils.

Invisible items include funds returned to China by her nationals residing abroad, which amounted to about US\$200,000,000 annually in prewar times, while China's prewar "surplus-capital" was estimated at about US\$500,000,000. Large sums accumulated and invested abroad by Chinese nationals during the war are expected to flow back into China's new industries after the war.

Discoveries of Oil and Iron Deposits. Reports from Chungking in May stated that China's National Geographical Survey had discovered rich oil, iron, and manganese deposits in Northwest China, located chiefly in Kansu and adjoining provinces. It was reported from Washington (Associated Press, April 30) that materials for drilling oil wells and building oil refineries were being shipped into China over the Burma-Ledo Road. According to Ralph K. Davis of the War Petroleum Administration, the installation of modern equipment in China was expected to increase both quality and quantity of China's primitive oil production.

The Chrysler Export Corporation announced in April that it had arranged for the construction in China of a network of truck repair bases to handle the increased truck transportation which had developed following the reopening of the Burma-Ledo roads.

China's Industrialization Vital. According to Howard Coonly, of the U. S. War Production Board, who made a survey of China's industrial prospects, "unless China is industrialized, future safety of

the East is in jeopardy." He said that China's industrialization is confronted by four major difficulties: lack of transportation, electric power, manpower, and raw materials of adequate quality. He said that China only had 6,000 trucks operating in April and that rail transport was practically non-existent, except in Japanese-occupied areas. Lack of modern transportation facilities forces the country to depend on inferior coal and ores and other materials when better products are available in the country, but inaccessible due to lack of transportation. Mr. Coonly assisted the Chinese in organizing a Chinese War Production Board, the first job of which was to pool available power production in industrial centers and control distribution. He expressed the opinion that lack of trained manpower would retard China's industrialization on a mass-production basis "for a long period of time, but it must be accomplished for the welfare of the world."

China Is Vital to America. Dr. Hung-ti Chu, research associate, made the following statement, connected with the Chinese Ministry of Information, in the course of an address in New York:

"Main American interests in China are commerce and trade, with the subordinate interests of religious, educational and philanthropic enterprises. Fundamental American policy is to maintain China's independence, which is essential to peace in the Far East. The American interests in China are supplementary to those of China as China desires to become an independent and strong democratic and modern nation. It is China's fundamental policy to cooperate with and secure assistance from the nations which treat China as their equal in order to reconstruct it and to build a better world order. America's far-sighted Open Door policy bore fruit when American trade with China from 1930 to 1936 exceeded that of China's trade with either Japan or England. In 1930, Japan's trade with China amounted to one-quarter of China's total foreign trade, while the American portion of China's trade only constituted one-sixth. In 1936, the ratio was completely reversed, and American trade with China topped the list. American trade with China stopped altogether following the establishment of Japan's blockade of the China coast and Japan's conquest of Burma. After the war, when China is able to begin her program of industrialization, American capital, goods and services on a large scale will be welcomed in China and the long-promised dream of America's China market will be fulfilled. A period of prosperity for both nations will be brought about by cooperation and mutual trust."

Race Against Time. China's currency situation continued to grow more chaotic in the first half of 1945, despite shipment to China of large quantities of gold bullion from the United States. An article by Henry J. Taylor (*World-Telegram*), who visited Chungking in June, asserted that currency inflation was more violent in the first six months of 1945 than in any earlier period. He said, "Chinese bills are printed and passed now in fantastic denominations—\$1,000 notes being so commonplace as to be picked up by our GIs in the market place and sent home as souvenirs." Dr. John W. Decker, former well known American missionary in China and now a member of the United China Relief organization, who visited Chungking in June, reported that the printing plant where the money was being turned out was the busiest place in the National Capital and that the products of the plant were "expanding in more ways than one."

A report from Chungking by the correspondent of the New York edition of the *Shanghai Evening Post* in August, stated that the official price of gold had been fixed at CN\$175,000 (Chinese national currency banknotes) for one tael, or Chinese ounce, and that American dollars were being exchanged at the all-time-high rate of US\$1 for \$2,500 in Chungking banknotes. O. K. Yui, Finance Minister, said that the Government had absorbed CN\$80,000,000,000 in an attempt to prevent fur-

ther inflation. According to Taylor's report, Dr. Lauchlin Currie, economist formerly on President Roosevelt's staff, who had served in an advisory capacity in financial matters in China, had recommended that American gold bullion be sent to China to bolster the paper currency. This, however, had been unsuccessful up to July, due to the fact that the gold had been "siphoned off" by the flow of China's trade into the hands of the Japanese merchants in the coastal ports. These coastal ports, under Japanese control, were the only source of goods, particularly cotton cloth required by the masses of the population. Mr. Taylor declared that "only true economic relief will come when Chinese Armies and an allied fleet can reopen Chinese ports and restore the flow of international trade."

An article in *Fortune* magazine in August said that present plans to control inflation involved "selling gold to mop up currency of big hoarders and to force their holdings onto the market, and selling textiles to drain off the general excess purchasing power and force prices down." Referring to the causes of the present crisis, *Fortune* said, "It is probable that civilian goods will come to play in Chinese politics and in Chinese resistance as direct, though less apparent, a part as materiel for the Army. For to hang on for eight years of war, China has had to use herself up. Without inflation China could not have carried out a long war; with it her strength to carry it out is measurably sapped. The country suffers; individuals suffer; the intellectuals who cannot get enough rice; the farmer who cannot buy simple blue cotton for his clothes. . . . Production suffers, long-term business operations . . . become difficult. . . . If China—and the U. S.—can fill a modicum of civilian needs, China's odds are good. . . ."

United Nations Relief Plans. A report from London in the New York *Times* on August 10 stated that the United Nations Relief and Rehabilitation Administration was prepared to ship 800,000 tons of supplies to China, just as soon as ports on the China Coast could be opened to international trade. The 800,000 tons, stated the report, would be in addition to some 30,000 tons already being shipped into Southwestern China over the Burma-Ledo Road. Included in the shipments were productive machinery, agricultural equipment, earth-moving machinery for repair of dikes and roads, textile machinery, and some food. Dr. T. F. Tsiang, chairman of the Chinese delegation on UNRRA said that relief and free distribution would be restricted, but that emphasis would be placed on public works which would provide mass employment. He said that public works would include construction and repair of railways, highways, dikes, wharves, and docks, upon which refugees could be employed.

United China Relief Program. Dr. James L. McConaughy, President of United China Relief, stated that the American people sent more than US\$9,500,000 to China in 1944 and that a total of US\$24,855,341 had been spent for China relief since the formation of the organization in 1941. He stated that these funds had made possible numerous relief projects, including medical aid, child welfare, refugee relief, and the training of medical workers.

Extensive Project in Szechuan. A report from Chungking stated that work had been started on the most extensive irrigation project ever undertaken in northwestern China. The project involved the irrigation of some 14,000,000 acres of land, mostly located in the valley of Ya, or Chenyi River. Some 1,800,000 inhabitants of the valley will benefit

from the plan, through an expected increase of rice production amounting to 14,000,000 tons.

China Received US\$362,000,000 Through Lend-Lease. Total lend-lease negotiations to all United Nations amounted to US\$41,208,000,000, to the end of May, 1945, of which China received goods amounting to \$362,000,000, according to a report of Leo Crowley, Foreign Economic Administrator, made public in Washington on Aug. 21. Russia received \$10,000,000,000 and Great Britain \$29,000,000,000, France \$510,000,000, American republics \$336,000,000, and other countries \$1,000,000,000.

It was not stated how much of the \$5,500,000,000 in reverse lend-lease came from China.

Maj. Gen. Hurley's Resignation. As a result of charges made before the Senate Foreign Relations Committee by Maj. Gen. Patrick J. Hurley that his attempts to bring about unification in China between the National or Kuomintang Government and the Chinese Communists, was being sabotaged by elements in the State Department, President Harry Truman made, on December 15, an extended statement concerning American policy in China.

The President's statement was made shortly following the departure for China of General of the Army George C. Marshall, who was appointed Special Presidential Envoy in place of Ambassador Hurley, who resigned on November 26. The President declared his and the U. S. Government's belief "that a strong united and democratic China is of the utmost importance to the success of the United Nations Organization and for world peace." On the other hand a disorganized and divided China "is an undermining influence to world stability and peace, now or in the future."

Continuing, the President declared that events "in this century" have indicated that a breach of the peace "anywhere in the world" threatens the peace of the entire world. The U. S. Government therefore believes it essential that:

1. A cessation of hostilities between the armies of the National Government and the Chinese Communists and other dissident armed forces, be arranged for the purpose of completing the return of all China to effective Chinese control, including the evacuation of Japanese forces.

2. A national conference of representatives of major political elements be arranged to develop an early solution to the present internal strife—a solution which will bring about the unification of China.

There followed a reference to the aims of the Cairo Conference in 1943, the Potsdam Declaration of July, 1945, and the Sino-Soviet Treaty and agreements of August, 1945, "all of which were committed to the liberation of China, including the return of Manchuria to Chinese control."

The President said that the United States had assumed a "definite obligation in the disarmament and evacuation of Japanese troops" and that the U. S. Marines are in China for this purpose. The United States recognizes and will continue to recognize the National Government of China and will cooperate with it in international affairs and specifically in eliminating Japanese influence. Therefore the United States is convinced that a prompt arrangement for the cessation of hostilities is essential . . . the United States will not extend military intervention to influence the course of any internal Chinese strife.

The U. S. believes that peace, unity and democratic reform in China "will be furthered if the basis of the present one-party Government is broadened to include other political elements in the

country, "hence the United States strongly advocates that a national conference of major political elements in the country agree upon arrangements which would give those elements fair and effective representation in the government."

The U. S. Government also recognized that the existence of autonomous armies such as that of the Communist Army is inconsistent with, and makes impossible, political unity in China. Therefore, with the institution of representative government, autonomous armies should be eliminated as such and all armed forces in China be integrated effectively into the Chinese National Army.

In concluding the President expressed the belief that China "has a clear responsibility to the other United Nations to eliminate domestic armed conflict which constitutes a threat to world stability and peace." The United States "would be prepared to assist the Chinese National Government in every reasonable way to rehabilitate the country, improve the agrarian and industrial economy, and establish a military organization capable of discharging China's national and international responsibilities for the maintenance of peace and order."

To this end the United States would be prepared to give favorable consideration to China's request for credits and loans under reasonable conditions for projects which would contribute toward the development of a healthy economy throughout China and healthy trade relations between China and the United States.

Maj. Gen. Patrick J. Hurley's charges mentioned specifically certain "career" officials of the State Department whom he charged with sabotaging American policy in China, a policy which had been set by the late President Franklin D. Roosevelt. He said that these officials belonged to "cliques" which supported British imperialism in Asia on the one hand and those who supported Russian Communism on the other. Among those mentioned who allegedly supported the Chinese Communists were John Service, John Carter Vincent and George Atcheson. He charged that some of these officials "had even advocated that a portion of U.S. lend-lease and UNRRA supplies be turned over to the Chinese Reds." In a public hearing before the Senate Foreign Relations Committee on Dec. 5 Maj. Gen. Hurley charged that certain officials of the Embassy in Chungking "were attempting to destroy the control government of Generalissimo Chiang Kai-shek."

Big Three On China. The Conference of the Big Three in Moscow in late December, 1945, issued the following statement: "With regard to the situation in China, they were in agreement as to the need for a unified and democratic China under the National Government, for broad participation by democratic elements in all branches of the National Government and for a cessation of civil strife. They reaffirmed adherence to the policy of non-interference in the internal affairs of China."

After several conversations between Secretary of State Byrnes and Mr. Molotov concerning Soviet and American troops in China, Mr. Molotov stated that the Soviet forces had disarmed and deported Japanese troops in Manchuria but that withdrawal of Soviet forces had been postponed until February 1st at the request of the Chinese Government.

Mr. Byrnes pointed out that American forces were in North China at the request of the Chinese Government, and referred also to the primary responsibility of the United States in the implementing of the terms of surrender with respect to the

disarming and deportation of Japanese troops. He stated that American forces would be withdrawn just as soon as this responsibility was discharged or the Chinese Government was in a position to discharge the responsibility without the assistance of the American forces. The two foreign secretaries were in complete accord as to the desirability of withdrawal of Soviet and American forces from China at the earliest practicable moment consistent with the discharge of their obligations and responsibilities.

Three-Point Plan. The final act in the Chinese political drama in 1945 was the proposal by the National Government of a "Three-Point Plan" for cessation of civil war. The plan proposed (1) that all hostilities cease and that broken railway communications be restored; (2) that the Government and the Communists immediately appoint representatives to confer with General Marshall on procedures to be adopted in all matters pertaining to cessation of hostilities and restoration of communications and (3) the Government proposes the elections of a military People's Political Council to inspect the military and communications situations in areas of conflict and to look into other matters having to do with the restoration of peace.

The Generalissimo declared that the Government would use "every possible peaceful means to solve internal conflicts."

Generalissimo Chiang Kai-shek sent his eldest son, Chiang Ching-Kuo, as a personal "good will" envoy to present a personal message and greetings to Premier Stalin. Since Generalissimo Chiang's son has been the National Government chief representative in Manchuria it was thought the message concerned the situation there.

Truce and Domestic Reforms. Generalissimo Chiang Kai-shek, President of the Chinese National Government, on January 10, 1946, proclaimed a truce in the domestic civil "war" with the Chinese Communists and at the same time issued an order for a sweeping set of political and democratic reforms. The Truce Plan had the approval of General George C. Marshall and the official representatives of both the National Government and the Chinese Communist regime at Yen-an. (For historical description of Chinese Communists, see CHINA, YEAR BOOK for 1944.)

The truce agreement, according to official announcement of Gen. Chang Chun, representative of the National Government and Gen. Chou En-lai of the Communist regime, included the following points:

1. All hostilities to cease immediately.
2. Except in certain specific cases, all movements of forces in China shall stop immediately; exceptions may include movements necessary for demobilization, redistribution, supply, administration, and local security.
3. Destruction or interference with all lines of communication shall cease and obstructions or interference with communications shall be removed.
4. An Executive Headquarters shall be established immediately at Peiping for the purpose of carrying out the agreements for cessation of hostilities. The headquarters shall consist of three commissioners, one representing the National Government, one the Communist group and one the United States of America.

Stipulations concerning cessation of hostilities are understood (1) not to interfere with military movements south of the Yangtze or for the execution of the plan of military reorganization of the National Government; (2) cessation of hostilities shall not interfere with or prejudice military movements of the National Army into or within Manchuria for the purpose of restoring national sovereignty; (3) lines of communications are understood to include postal communications; (4) any military movements covered by the foregoing stipula-

tions shall be reported daily to the Executive Headquarters in Peiping.

American participation within the Headquarters shall be solely for the purpose of assisting the Chinese members in implementing the order for the cessation of hostilities.

Generalissimo Chiang's Far Reaching Reforms. Reforms announced by President Chiang Kai-shek, simultaneously with the announcement of the truce, included the following:

1. Steps to insure freedom of person, of conscience, of publication and of assembly.
2. Abrogation of secret police activity in assuring that rulings were being made under which only proper judicial and police authorities would be permitted to arrest, try or punish individuals.
3. Equality of "all legal parties before the law" and their right to open activity "within the law."
4. Release of all political prisoners "except traitors and those found to have committed definite acts injurious to the Republic."
5. Promotion of local self-government everywhere, with popular elections to be held "according to law" and from "the lowest strata upward."

The three Commissioners in charge of the Executive Headquarters in Peiping will include: National Government, Gen. Cheng Chien-min, head of intelligence department of Board of Military Operations; Communists, Lieut. Gen. Yeh Chien-ying; American commissioner, Walter G. Robertson, U. S. Charge d'Affaires in China. Each commissioner will have approximately 100 officers and men under the Headquarters. The American personnel will be headed by Col. Henry A. Byroade, who will serve as Mr. Robertson's executive officer.

General Marshall said the truce agreement represented the "earnest desire manifested by both sides to find a practical solution to the difficulties during the negotiations." Generalissimo Chiang, in a speech before members of the Political Consultative Commission of thirty-six members, declared, "We must consider a fundamental plan leading from war to peace and from resistance to reconstruction." He urged the Conference to see that the National Assembly is convened according to schedule and declared, "We must try to eliminate by means of consultation and concerted endeavors, all the factors that are likely to impair the unity of the national will, exert an influence adverse to social peace and stability or delay the work of national revival. . . . I am ready to accept all the decisions of the Conference if they are beneficial to national reconstruction and tend to promote the popular welfare and can help the democratization of the country."

JOHN B. POWELL.

CHRISTIAN SCIENCE. A system of metaphysical or spiritual healing set forth by Mary Baker Eddy in her textbook of the Movement, *Science and Health with Key to the Scriptures*, first published in 1875. The first church was established by Mrs. Eddy in Boston in 1879. In 1892 it was reorganized as a voluntary religious association, known as The First Church of Christ, Scientist, in Boston, but called more frequently by its adherents "The Mother Church." The total number of recognized branches of The Mother Church in the United States reported for the fiscal year ending May 31, 1944, was 2,178, and there are also 66 college and university organizations. Total branches for the world, 2,870.

The affairs of The Mother Church are administered, under the Church Manual by Mary Baker Eddy, by a board of directors which supervises the work of the board of education, board of lectureship, and Committees on Publication. The board of education instructs and authorizes students to teach Christian Science. The board of lectureship

consists of 25 members who are engaged in delivering free lectures on Christian Science.

The Christian Science Publishing Society, whose affairs are administered by a board of trustees, also according to the church by-laws, issues the daily paper of the organization, *The Christian Science Monitor*. Other periodicals include *The Christian Science Journal*, *Christian Science Sentinel*, *Christian Science Quarterly*, and four editions of *The Herald of Christian Science*, in the German, French, Dutch, and Scandinavian languages, each with the English translation opposite, and in Braille.

Mrs. Myrtle Holm Smith is president of The Mother Church for the year 1945-46. Headquarters are at 107 Falmouth Street, Boston, Mass.

CIVIL AERONAUTICS ADMINISTRATION (CAA). A branch of the U.S. Department of Commerce which encourages and fosters the development of civil aeronautics and air commerce; encourages the establishment of civil airways, landing areas, and other air navigation aids and facilities; designates Federal airways and acquires, establishes, operates, and maintains air navigation facilities along such civil airways and at landing areas; makes provision for the control and protection of air traffic moving in air commerce; undertakes or supervises technical developmental work in the field of aeronautics; plans for the development of aeronautical facilities; and maintains and operates the Washington National Airport. The Administrator also enforces the civil air regulations (excepting the functions of the Civil Aeronautics Board, q.v.).

The locations for the construction or improvement of airports under this program are selected on the basis of their importance to national defense and to future civil aviation. The Administration advises the War and Navy Departments on the disposition of surplus war airports and State and local units of government on airport site selection, planning, development, and maintenance.

The Federal Airways System, which has been extended throughout Alaska, is being further expanded and improved to provide the type of dependable communications service and air navigation facilities required for the successful conduct of military operations in that area. Installations in Hawaii and the Pacific Islands, as well as in the Caribbean area, are now proving their military value. The Federal Airways System now comprises a network of more than 40,000 miles of "highways of the air."

Development work is proceeding in the fields of very high frequency communication and directional guidance facilities; monitoring equipment; flutter and vibration of aircraft components; engine nacelle fires; airport design and construction; soil testing and stabilization; airport lighting; obstruction marking by radio; traffic control; instrument landing systems; and aeronautical charts.

Theodore Paul Wright succeeded Charles I. Stanton as Administrator on Aug. 22, 1944.

CIVIL AERONAUTICS AUTHORITY. A division of the U.S. Department of Commerce. Its functions are discharged by the Civil Aeronautics Administration and the Civil Aeronautics Board (q.v.).

CIVIL AERONAUTICS BOARD (CAB). A five-man non-partisan board organized independently within the U.S. Department of Commerce. It prescribes safety standards and regulations and has the power to suspend and revoke safety certificates, regulates air carriers, makes accident rulings and recommenda-

tions, and investigates accidents. Chairman in 1945: L. Welch Pogue.

CIVIL AIR PATROL (CAP). Formerly an agency under the OCD, established in 1941 to organize a volunteer corps of civilian airmen to aid in wartime tasks; transferred to the War Department in 1943 to be operated as an auxiliary of the Army Air Forces.

CIVILIAN DEFENSE, Office of. Adhering to the trend started during the last six months of 1944, the U. S. Office of Civilian Defense continued to curtail its programs and personnel in 1945. The sustained favorable progress of the Allied military forces made possible the termination of the Office of Civilian Defense as a Federal organization on June 30, 1945. The U. S. Office of Civilian Defense established on May 20, 1941, by Executive order of the President, thereby became the first war agency to cease its activities. By the date of termination the staff of the Office consisted of fewer than 100 persons, including military personnel on detail to the agency. In authorizing the abolition of the Office of Civilian Defense, the President stressed that the States and local governments should continue the activities of civilian defense volunteers in the local communities.

To perform its responsibilities under the May 20, 1941, Executive order as amended, the Office of Civilian Defense was organized during 1945 into the Divisions of Protective Property, Protection Services, Federal-State Cooperation, and Industrial Protection. Briefly, these responsibilities were: (1) to assure effective coordination of Federal relations with State and local governments; (2) to provide for necessary cooperation with State and local governments in respect to measures for adequate protection of civilian population in emergency periods; (3) to facilitate constructive civilian participation in the war program. The Protective Property Division administered an investment of approximately \$52,000,000 by the Office of Civilian Defense in protective equipment, of which about \$34,000,000 had been distributed on loan to about 2,900 communities. Operations under the Division's program included liquidation of two remaining warehouses, taking physical inventories of equipment at local levels, reconciling accounts, meeting needs of the Armed Services, and ascertaining surpluses. From July 1, 1944, to the end of February, 1945, with the exception of equipment required by the armed forces, the Office of Civilian Defense permitted voluntary reallocation of its protective property among communities from excess declared by the original receiving community. After February 28, 1945, the Office of Civilian Defense followed the policy of reporting as surplus to the appropriate disposal agency all property declared excess by the States and local communities. At the same time, however, the Office reserved the right of reporting as surplus, as the situation warranted, protective property wherever located and whether or not declared by the State or community as excess to its needs. Realizing that many States and communities were interested in retaining permanently the protective property in their custody, the Office of Civilian Defense arranged to report to the proper disposal agency the desire of a particular State or community to acquire such property. Under the Surplus Property Act, the State and local governments were given priority over all other purchasers of surplus property except for the requirements of Federal agencies. In the case of protective property, such as helmets, gasmasks and

armbands already in the possession of civilian defense volunteers, a bill was introduced in the House of Representatives in March, 1945, authorizing the retention of such property by the volunteers. As of June 30, 1945, the bill had not yet been enacted into law.

The Protection Services Division was responsible for providing advice to the States to aid them and local communities in maintaining volunteer protective organizations at an adequate level of proficiency. Through its advisory services to the States, the Division directed a greatly reduced program of passive protection against air raids, sabotage and other war hazards such as disasters, hurricanes, and floods. Early in April, 1945, as the collapse of Germany became more imminent, Lt. Gen. William N. Haskell (Ret.), Director of the Office of Civilian Defense, wrote to governors of all States outside the Western Service Command, informing them that the Office after V-E Day would confine its protection services to the West Coast, and suggesting that the States and local communities in other regions take over the supervision of auxiliary firemen and policemen as well as emergency medical and rescue services.

The Division of Federal-State Cooperation was responsible for facilitating cooperation between States and Federal agencies executing those programs and campaigns, essential to the successful prosecution of the war, which required community participation and the services of volunteers. The Division also acted as a clearing-house of information among States regarding organization and activities of local defense councils. The program and personnel of the Division of Federal-State Cooperation was sharply reduced in November and December 1944. During the six months of the agency's 1945 operations, the Division's program was conducted by no more than three employees who kept abreast of Federal programs requiring the use of civilian volunteers, such as salvage, rationing, recruiting women for the Armed Services, housing, nutrition, consumer interests, war savings, and similar programs, and served as a channel of information to the State and local defense councils.

The Industrial Protection Division was responsible for the coordination of the States War Inspection Service (SWIS) which was a voluntary inspection service carried on in each State under the supervision of the State Fire Marshal, or similar official, by qualified fire and accident prevention inspectors who served without expense to the government. At the time the Office of Civilian Defense was terminated, the SWIS was providing inspection services for approximately 11,000 plants and facilities. Following the termination of the agency, the question of continuing the program became the responsibility of the individual States.

During the closing weeks of 1944, renewed interest in the protection programs of the Office of Civilian Defense was stimulated by the joint War and Navy Departments' statement that robot bombing of the Eastern Coast was a possibility. Commanding Generals along the eastern seaboard were instructed by the War Department to coordinate their defense preparations with local civilian defense organizations. As winter wore into spring and the complete defeat of the Nazi armies became more imminent, it was decided that none of the programs need be continued as a Federal responsibility after V-E Day. Accordingly, on May 2, 1945, the President advised Congress that the budget estimate of the Office of Civilian Defense for the fiscal year 1946 was being withdrawn and the agency would be abolished on June 30, 1945.

Simultaneous with his communication to Congress, the President issued a statement which stressed the continued need for volunteer efforts in States and local communities. He expressed his appreciation to the volunteer members of the Citizens Defense Corps and the Civilian War Services and to the employees of the Office of Civilian Defense for their services in mobilizing the civilian population for the effective prosecution of the war. Although developments in the European war made possible the discontinuance of Federal supervision of civilian defense, the President stated "this change does not in any respect lessen the need for volunteer efforts in our States and communities." He then declared, "States and local governments are fully aware of their continuing responsibilities, and I am sure that we can depend upon their knowledge and the patriotism of the millions of volunteers to continue the war jobs in which the whole nation has had to be trained. Protection volunteers, such as auxiliary firemen and policemen, working with State and local governments have done a magnificent job through their defense councils in organizing to protect the nation against the threat of enemy action, sabotage and other war hazards. Civilian War Services volunteers have likewise rendered invaluable assistance."

"The millions of volunteer workers throughout the nation, giving freely of their time, have been basic to the strength of our democracy. I know they will willingly continue to serve."

On June 4, 1945, President Truman signed Executive Order No. 9562 terminating the U. S. Office of Civilian Defense effective June 30, 1945. Under the Executive order all protective property of the Office of Civilian Defense was transferred to the Department of Commerce. The Secretary of Commerce was to exercise all the functions incident to the storage, care, transportation, inspection, and disposition of such property. These functions were to be conducted by him in consonance with the Surplus Property Act of 1944 and the regulations of the Surplus Property Board. Except for the functions assigned to the Secretary of Commerce, the Executive order provided that the Secretary of Treasury through the Bureau of Accounts should wind up the affairs of the Office. The Executive order also provided that so much of the funds, records, property, and personnel as the Director of the Bureau of the Budget determined were to be transferred to either the Department of Commerce, or the Treasury for the purpose of carrying out their responsibilities under the Executive order.

At the close of business, June 30, 1945, Executive Order No. 9562 became effective. The Office of Civilian Defense as a Federal organization ceased to exist.

CIVIL SERVICE, U. S. The U. S. Civil Service Commission, as the central personnel agency of the Federal Government, has the responsibility of carrying out Federal personnel policies and procedures established under statutory or executive authority. It furnishes qualified civilian workers who have passed competitive examinations to fill positions in the Federal executive agencies.

Since the end of hostilities of World War II, in August, 1945, the Commission's major activities have been related to (1) the employment of veterans in Federal positions, (2) the restoration of veterans to their former Federal positions, if they desire restoration, and (3), an adjustment, by reductions in force, in the number of civilian employees on the Federal payroll to meet postwar needs.

The Civil Service Commission administers the Veterans' Preference Act of 1944, which gives preference in civil-service examinations to certain classes of persons because of military service. The act also restricts examinations, for certain positions, to persons entitled to preference so long as such persons are available to fill vacancies in the Federal service; and, for 5 years following the legal termination of the war, it empowers the President to designate other examinations in which competition may be limited to veterans. Persons employed in the Federal Government, if entitled to veteran preference, are granted certain retention rights.

Since Aug. 17, 1945, the Commission has accepted applications for positions in the Federal service only from persons with veteran preference who are entitled to have examinations reopened to them, and from Government employees released, or about to be released, in reductions in force. However, when the supply of returning veterans, and employees terminated because of reductions in force, is not sufficient to fill vacancies, the Commission has lifted the ban on receipt of applications from the general public.

More than a quarter of a million veteran placements—including placements of the wives of disabled veterans and the widows of veterans—were made in the Federal civil service during the year 1945. In the 3 years since Jan. 1, 1943, veteran placements have reached a total of approximately 550,000. By the end of 1945, 15,000 physically impaired veterans had been placed in Federal positions.

Approximately 680,000 persons left the Federal service to join the armed forces. Those restored to their former positions in accordance with the provisions of the Selective Training and Service Act since July 1, 1944, totaled more than 40,000 by the end of November, 1945.

The highest total civilian employment in the history of the Federal executive civil service occurred during World War II. There were fewer than 1,000,000 paid civilian workers on the Federal payroll in June 1939. Immediately thereafter, Federal employment steadily increased until the peak of employment was reached in June 1943 when paid civilian employment in the continental United States totaled more than 3,000,000 persons. Of this total, 2,720,000 were employed in Federal establishments outside Washington, D. C., and 280,000 were employed in Washington, D. C.

At the end of July, 1945, the total number of paid Federal employees stood at 2,900,000. Of this total, the War and Navy Departments employed 1,837,000 civilians—53,000 in their departmental headquarters, and 1,784,000 in their field establishments in war activities as follows:

Shipbuilding, repair and servicing at Navy Yards . .	327,000
Army Air Forces	384,000
Naval Air Operations	111,000
Naval Procurement, supply, and inspection . . .	86,000
Army Quartermaster	74,000
Army Ordnance	150,000
Naval Ordnance, Ammunition Depots, Torpedo Stations, etc.	87,000
Chemical Warfare Service	23,000
Army Signal and Transportation Corps	127,000
Army and Navy Hospitals and Medical services . .	19,000
Army Engineers	75,000
Army Service Commands	246,000
Marine Corps and Coast Guard activities	22,000
Miscellaneous other War and Naval activities . .	53,000

Emergency war agencies employed 160,000 war workers, making a total of 1,997,000 civilian workers engaged in war work. All other Federal agencies combined employed 903,000 persons, many of whom were also performing war work.

By the end of November, 1945, total Federal paid civilian employment in the continental United States had decreased to 2,450,000. Reductions in civilian employment have been made in accordance with the Commission's reduction-in-force regulations which have been set up under the authority of the Veterans' Preference Act of 1944, providing that, in a reduction in Federal civilian personnel, competing employees shall be released according to tenure of employment, military preference, length of service, and efficiency ratings. It is estimated that through the program adopted paid civilian employment in the Federal service will decline to approximately 2,000,000 persons by July 1, 1946.

A highlight in Federal personnel administration during the war was the Government's increased employment of physically impaired persons. The program for employing such persons was developed by the Medical Division of the Commission, which made a systematic analysis of the physical requirements of positions in the field service, particularly those in critical labor-shortage categories, with a view to making more positions available to the physically impaired. More than 5,100 kinds of jobs were studied. During the 3 years from October, 1942 to October, 1945, 70,000 physically impaired persons, about one-fifth of whom were veterans, were placed in Federal field establishments.

Another progressive step made during the year was the enactment of the Federal Employees Pay Act of 1945 by the 79th Congress. The Act increased the basic rates of pay of approximately 1,220,000 employees, and the rate of overtime compensation of nearly 1,480,000 employees, as of July 1, 1945. Federal employees who do satisfactory work are granted periodic salary advancements within the grades they occupy. The Pay Act reduced the waiting periods for these within-grade salary advancements from 18 months to 12 months for employees with salaries below \$4,700 per year, and from 30 months to 18 months for employees in salaries above this amount.

In addition to announcing and holding competitive civil-service examinations, and administering the Veterans' Preference Act of 1944, the United States Civil Service Commission conducts investigations relative to (1) the enforcement of civil-service law, (2) suitability of applicants (as regards character, trustworthiness, loyalty, etc.) for certain types of positions, and (3) the qualifications of applicants for top administrative positions; administers the Classification Act of 1923, as amended, which provides for the classification of positions according to duties and responsibilities; administers an efficiency-rating system; maintains service records and qualifications records of Federal employees; administers statutory provisions and civil-service regulations restricting political activity by Federal employees in positions subject to the Civil Service Act and by certain State and local employees participating in Federally financed activities; administers the Civil Service Retirement Act, the Canal Zone Retirement Act, and the Alaska Railroad Retirement Act. It also conducts a continuous study of personnel procedures, the purpose of which is to improve personnel management throughout the Federal service, and thus bring about the most effective use of the time and skills of Federal employees.

The Commission emphasizes the employment of veterans, and, from time to time, prepares, for recommendation to Congress, additional legislation which, it believes, will contribute to the

welfare of Federal employees and to greater economy and efficiency in personnel administration.

HARRY B. MITCHELL.

COAL. The United States maintained its position as the world's leading coal producer in 1945, but production of both bituminous and anthracite dropped from 1944 levels in the wake of labor difficulties. Bituminous coal output for the 1945 calendar year was 576,000,000 tons (1944: 620,000,000 tons); anthracite, 54,615,000 tons (1944: 64,445,000 tons).

Production got off to a bad start when cold weather slowed and in some cases halted shipments, forcing users to draw on already seriously depleted inventories. In particularly bad condition were coking coal stocks of the steel industry in the Pittsburgh and Birmingham districts, and in several cases mines were operated seven days a week in an attempt to make up the deficiency. This effort was nullified, however, when delays in negotiating a new wage agreement with the United Mine Workers union for the April 1, 1945-March 31, 1946 "coal year" caused widespread unauthorized walkouts early in April. These strikes, which persisted into early May, cost approximately 6,000,000 tons bituminous production, dragged down iron and steel production, and resulted in the government taking over 258 mines. The new wage agreement, agreed to April 11 and finally approved by the director of economic stabilization April 30, raised production costs an average of approximately 21 cents per ton, of which 16 cents was passed on to consumers in higher prices with Office of Price Administration approval. When the anthracite wage agreement came up for renewal May 1, a similar strike situation occurred, with the government taking over operation of about 363 mines in Pennsylvania May 4. The anthracite wage agreement, which was approved June 6, increased labor costs 60.7 cents per ton, and resulted in price increases of \$1 per ton on domestic sizes and 25 to 50 cents per ton on industrial sizes effective June 18. The mines were turned back to operators as soon as it was determined production would be continuous.

The most serious interruption to production came in October when the Union attempted to secure recognition as the bargaining agent for bituminous mine supervisory employees. By October 5, approximately 500 bituminous mines were strikebound and 200,000 miners idle. Steel production reacted almost immediately. Although the strike was called off without accomplishing its purpose, effective October 22, steel production recovered more slowly and some mills were holding down operations, in order to husband coal inventories, until the end of the year.

To alleviate suffering in Western Europe, where coal production had been slowed to a dribble by the ravages of war, the United States agreed to send 8,113,000 tons, about five days' production. The great Silesian coal-producing areas came under Russian jurisdiction in the occupation agreement.

Fitting the decreased American production to requirements was a tight squeeze despite the end of the war. Householders continued to be limited to 80 percent of normal usage of scarce eastern hard coals, and industrial coke users were limited to a 20-day inventory on October 15. Free domestic usage of soft coals was permitted however.

By-product coke production was 61,599,228 tons in 1945 (1944, revised: 67,064,795 tons). Beehive coke production dropped for the second

successive year, totalling 5,155,100 tons (1944, revised: 6,973,022 tons).

CHARLES T. POST.

COAST AND GEODETIC SURVEY. A branch of the U.S. Department of Commerce. In addition to surveying and charting the coasts, it compiles tide and current tables, aeronautical charts, magnetic information, seismological and gravitational and astronomical observations. All operations of the Survey were directed to meet war needs. Director: Leo Otis Colbert.

COAST GUARD, U. S. Demobilization of the Coast Guard's record wartime personnel of 173,165 officers and men, including 9,624 in the SPARS, was exceeding its scheduled minimum rate of approximately 800 commissioned, chief warrant and warrant officers and 13,000 enlisted persons per month by November, 1945. The program will extend over a period of 10 months from Sept. 1, 1945, and will reduce the military establishment to a complement of 3,500 commissioned officers, 1,400 chief warrant and warrant officers and 30,000 enlisted men. The Coast Guard has adopted the Navy formula for determining the method of discharge in order to insure maximum fairness in deciding the order of eligibility, for return to civilian life. All enlistments in the Reserve and Women's Reserve (SPARS) have been discontinued and future original enlistments will be in the regular Coast Guard and limited to 17 through 25 year olds.

All volunteer Temporary Reservists serving without pay, were scheduled for disenrollment as of Sept. 30, 1945, and all other classes of Temporary Reservists, including pilots, officers on Great Lakes vessels, and Civil Service employees, were disenrolled as of Nov. 30, 1945. Enrollment in the Temporary Reserve at one time totaled 52,333. Tentative plans were being made to retain a number of Reserve officers on active duty with their consent and the majority of these may be inducted into the Regular Coast Guard following the enactment of necessary legislation.

There were 1,677 Coast Guard craft in active service at the close of the 1945 fiscal year. The 262 Army vessels manned with 6,851 Coast Guardsmen at that time, and the 288 Navy transports, cargo ships, destroyer escorts, frigates, and landing craft on which 49,283 were stationed, were being rapidly decommissioned or turned back to the Army and Navy by the close of 1945. Nearly 3,000 reserve vessels which had been taken over or purchased during the war had been returned to their owners or disposed of.

The third anniversary of the SPARS on Nov. 23, 1945, found them in process of demobilization along with the other military Reserves of the Coast Guard. While the number of SPARS has not been large in comparison with the number of WACS and WAVES, which reached nearly 100,000 each, it has been large in proportion to the total personnel of the Coast Guard, one out of every sixteen enlisted persons being a SPAR. The Coast Guard was able to absorb such a large percentage of women into its organization because it selected women with usable skills, trained them quickly principally as Coast Guard yeomen and storekeepers, and assigned them so as to match the jobs to be done with the persons available. SPARS also attended certain Navy schools and were trained as sound motion picture technicians, link trainer operators, parachute riggers, chaplain's assistants and air control tower operators. Others attended Coast Guard schools and learned to be

BUSHER, THE HORSE OF THE YEAR

Three-year-old filly, daughter of War Admiral and Baby League, owned by Louis B. Mayer, won 10 of her 13 starts and rolled up winnings of \$273,735.

CONTEST WINNERS OF 1945

In the United States today there is a bewildering list of national contests and awards, from the beach parade producing the shapeliest and most talented "Miss America" to the tests selecting the hen laying the most eggs.

Professional baseball has its World Series which hundreds of thousands of fans follow avidly; college football players strive to make the mythical All American team. There are champion fencers, prize-fighters, swimmers, skaters, tennis players, trap-shooters, fly and bait casters, skiers, bobsledders—all through the 125 recognized American sports.

The Art museums award for painting and sculpture; writers may receive a Pulitzer prize or the sought-after Nobel award. Scientific and technical societies honor their workers for conspicuous achievement; the Metropolitan Opera picks young members by a competition; a fine bird dog has a chance to be crowned as winner of the National Field Trials or the Retriever tests, a race horse to be "the horse of the year," a trotter to win the Hambletonian crown. Beef cattle, milch cows, bench show dogs, chickens and cats, show ring horses—all complete. There are even annual prize-winning new flowers and garden vegetables.

Winners in Sports will be found in **SPORT RECORDS** and the articles on separate sports. A number of prize paintings are shown in the Art illustrations. The following pages show some picturesque figures of these contests.

Here is partial list of 1945 awards:

American Institute of Architects Awards; Exhibition Medal, established in 1921. To Bertram Goodhue and Lee Lawrie in ecclesiastical building, to Reginald Johnson in domestic building, to Charles Z. Klauder in institutional building, to Howard D. Smith in public build-

ing to George C. Nimmmons in industrial, to Charles D. Maginnis and Timothy Walsh in ecclesiastical, to Edward L. Tilton and Alfred Morton Githens in public building, to Sprout and Rolph of Toronto, Canada, in institutional, to A. Stewart Walker and Leon N. Gillette in domestic, and to Arthur Loomis Harmon in commercial.

Gold Medal, established in 1906. Sir Aston Webb, Charles Pollen McKim, George B. Post, Jean Louis Pascal, Victor Laloux, Henry Bacon, Sir Edwin Landseer Lutyens, Bertram Grosvenor Goodhue, Howard Van Doren Shaw, Milton Bennett Medary, Ragnar Ostberg, and Paul Philippe Cret.

Craftsmanship Medal, established in 1915. Henry C. Mercer in ceramics, Samuel Yellin in iron work, Frederick W. Goudy in typography, Charles Jay Connick in stained glass, V. F. Von Losberg in metal work, Frank J. Holmes in ceramics, William D. Gates in ceramics, the Cheney Brothers in textiles, John Kirchmayer in wood carving, Leon V. Solon in terra cotta and faience, Walter W. Kuntack in metals in glass, and illuminating fixtures; John J. Farley in concrete, and Joseph Dulles Allen in ceramics.

Fine Arts Medal, established in 1919. Paul Manship in sculpture, Arthur F. Mathews in painting; John Singer Sargent in painting, Dr. Leopold Stokowski in music, Lee Lawrie in sculpture, H. Siddons Mowbray (posthumously) in painting, Diego Rivera in painting, Adolph Alexander Weinman in sculpture, Frederick Law Olmsted in landscape architecture, James Henry Breasted in literature pertaining to the Fine Arts, Robert Edmond Jones in design for the theatre, and Carl Milles in sculpture.

HORTICULTURE

The American Rose Society selected as the All-American Rose of the year a new variety, originated by Francis Meiland at his gardens in Antibes, Southern France. Bud stock was taken, and in 1943 the required two-year tests started in fifteen official gardens. The final score of entry 43 R12 was the highest ever recorded since these tests started in 1939. Named "Peace," this champion rose is now being distributed—a beautiful large, hardy, free blooming, cream-yellow variety with a pink picotee edging to the new petals.

MOTION PICTURES

The National Board of Motion Pictures announced its choices of the year's best films, on the basis of artistic merit and importance.

Best film of the year: *The True Glory*

The ten best films in order of preference.

1. *The True Glory*
2. *The Lost Weekend*
3. *The Southerner*
4. *The Story of G.I. Joe*
5. *The Last Chance*
6. *Colonel Blimp**
7. *A Tree Grows in Brooklyn*
8. *The Fighting Lady*
9. *The Way Ahead*
10. *The Clock*

* The choice of *Colonel Blimp* is based on the merit of the uncut version of the film as it was originally released in the United States.

The Committee on Exceptional Photoplays selects:

The best performance of the year by an actor: Ray Milland in *The Lost Weekend*.

The best performance of the year by an actress: Joan Crawford in *Mildred Pierce*.

The best direction of the year: Jean Renoir for *The Southerner*.

Chosen by the Review Committees as the most popular films of the year:

1. *National Velvet*
2. *The Lost Weekend*
3. *The House on 92nd Street*
4. *Anchors Aweigh*
5. *The Fighting Lady*
6. *Keys of the Kingdom*
7. *The Story of G.I. Joe*
8. *A Tree Grows in Brooklyn*
9. *The True Glory*
10. *The Valley of Decision*

LITERATURE

Nobel Prize. Gabriela Mistral of Chile.

Pulitzer Prizes. John Hersey, novel, *A Bell for Adano*; Mary Coyle Chase, play, *Harvey*; Stephen Bonsal, history, *Unfinished Business*; Russell Blaine Nye, biography, *George Bancroft: Brahmin Rebel*; Karl Jay Shapiro, poetry, *V-Letter and Other Poems*; Harold V. (Hal) Boyle, A.P., for distinguished correspondence. James B. Reston, A.P. features; George W. Potter, *Providence, R.I., Journal Bulletin*, editorials; Mark S. Watson, *Baltimore Sunpapers*, telegraphic reporting; Jack McDowell, *San Francisco Call-Bulletin*, series on blood donors; Russell Blaine Nye; Joe Rosenthal photograph of flag-raising on Iwo Jima.

FIFTY OUTSTANDING BOOKS OF THE YEAR

The American Library Association selected its annual list of the year's outstanding books, most worthy of the attention of the present-day reader, though not necessarily of permanent value. The fifty titles were:

Adamic, *Nation of Nations*; Adams, A. Woolcott; Auden, *Collected Poetry*; Barzun, *Teacher in America*; Bowers, *The Young Jefferson, 1743-89*; Bromfield, *Pleasant Valley*; Caruso, *Enrico Caruso, His Life and Death*; Costain, *The Black Rose*; Dickinson, *Bolts of Melody*; Dobie, *A Tezan in England*; Du Bois, *Color and Democracy*;

Eskelund, *My Chinese Wife*; Harvard committee report, *General Education in a Free Society*; Hobart, *The Peacock Sheds His Tail*; James, *Cherokee Strip*; Langley, *A Lion Is in the Streets*; Lattimore, *Solution in Asia*; Lauterbach, *These Are the Russians*; Lewis, *Cave Timberlane*;

MacDonald, *The Egg and I*; Marshall, *The World, the Flesh and Father Smith*; Marshall, *General Marshall's Report*; Mauldin, *Up Front*; Mencken, *First Supplement, American Language*; Norris, *Fighting Liberal*; Papashvily, *Anything Can Happen*; Peattie, *Immortal Villages*; Pinckney, *Three O'Clock Dinner*; Rau,

Home to India; Robeson, *African Journey*; Russell, *History of Western Philosophy*; Santayana, *Middle Span*; Schlesinger, *Age of Jackson*; Shaw, *Elckshaw Boy*; Shallabarger, *Captain From Castile*; Simonov, *Days and Nights*; Smyth, *Atomic Energy for Military Purposes*; Snow, *The Pattern of Soviet Power*; Stegner, *One Nation*; Steinbeck, *Cannery Row*; Stewart, *Names on the Land*; Ullman, *The White Tower*; Wallace, *Sixty Million Jobs*; Welles, *An Intelligent American's Guide to the Peace*; Westcott, *Apartment in Athens*; Willison, *Saints and Strangers*; Wise, *Springfield Plan*; Woodward, *Tom Paine, America's Godfather, 1737-1809*; Wright, *Black Boy*; Yank, *Beat From Yank, the Army Weekly*.

SCIENCE

BIOLOGY. Stephen Hale Award in plant physiology to Dr. Ray F. Dawson of Princeton University. Professor N. G. Chlodny of the University of Kiev won the Charles Reid Barnes Life Membership in the American Society of Plant Physiologists. The Sir William Schlich forestry medal was given to Professor Henry S. Graves, emeritus dean of the Yale School of Forestry.

CHEMISTRY AND PHYSICS. Col. Bradley Dewey, former U. S. Rubber Director, won the annual Chemical Industry medal for work in colloid chemistry. Dr. William Mansfield Clark, Johns Hopkins University, for work on the acid or alkaline state of milk, the Borden Company Prize of \$1,000. Dr. Joseph S. Fruton, Rockefeller Institute for Medical Research, the \$1,000 Eli Lilly & Company prize in biological chemistry for studies of the amino acids. Dr. Elmer K. Bolton, chemical director of the Du Pont Company, won the Perkin medal of the American section of the Society of Chemical Industry. Dr. Arthur C. Cope, Columbia University, the American Chemical Society Award of \$1,000 in pure chemistry for researches on vinyl and allyl chemical types in plastics and drugs. Dr. William David Coolidge, General Electric Company, and Dr. Peter Kapitza, U.S.S.R. Academy of Sciences, Franklin medals by Franklin Institute. Dr. Robert Clark Jones, the Adolph Lamb medal for mathematical calculation for optics which made possible an optical gunsight for bazookas.

ENGINEERING AND TECHNOLOGY. The Edison medal to Dr. Vannevar Bush, president of the Carnegie Institution of Washington, for contributions in electrical engineering.

ENGINEERING AND TECHNOLOGY. The Faraday medal of the British Institute of Electrical Engineers, to Dr. Irving Langmuir of the General Electric Research laboratory.

MEDICINE. The gold medal of the American Academy of Orthopedic Surgeons to Col. John L. Gallagher for his development of compression dressings for wounds, burns and frostbite. Discovery that certain hormones and synthetic chemicals may become weapons for fighting tumors of the uterus in women during the child-bearing period won the second \$2,000 Charles L. Mayer Award for Dr. Alexander Lipschutz of Chile.

PSYCHOLOGY AND PSYCHIATRY. Col. William C. Menninger, chief of the psychiatric division of the Army's Surgeon General's office, from the National Committee for Mental Hygiene, the new \$1,000 Lasker award for his outstanding contribution to the mental health of service men and women.

TOSSING THE WINNING COXSWAIN OVERBOARD, AFTER THE LIFEBOAT RACE (U.S.M.S.)

GABRIELLE MISTRAL

Chilean winner of the 1945 Nobel Prize for Literature. Novelist, poet, sociologist, biographer and political figure, her first book appeared in 1922, and she is the first woman of Latin America to be so honored internationally. (*Jean Manzon, Pix*)

THE AMAZING TROTTER TITAN HANOVER, 1:58, THREE-YEAR-OLD CHAMPION

trained and driven by Harry Parnall, owned by C. Roland Harriman and Elbridge T. Gerry. The daughter of War Admiral. Won \$57,431.55 in 1944-45. Outclassed competitors so that public was not allowed to bet. (Bob Kenefick)

SEP PALIN, GRAND OLD MAN OF HARNESS RACING

Broke world trotting record with Grayhound's 1:55 $\frac{1}{4}$. Topped Grand Circuit winners, led all drivers with winnings of \$77,431.07.

MARIA CERRA (RIGHT) WOMEN'S INTERCOLLEGIATE FENCING CHAMPION
in a bout with Berly Petchesky, Captain of NYU team. (Acme)

BARBARA ANN SCOTT (RIGHT), NORTH AMERICAN CHAMPION, AND GRETCHEN MERRILL, RUNNER-UP
16 year old Barbara, Canadian Ladies Senior Champion won the National figure skating

BYRON NELSON, GOLF'S WONDER MAN

Leading money winner of the year, who won every tournament but two of those he entered in the winter pro circuit. (Press Assn. Inc.)

NORMAN C. ARMITAGE, NATIONAL SABRE WINNER

Mr. Armitage, of the Fencers Club, successfully defended his title. (Acme)

BLACK MAGIC OF AUDLON, NATIONAL CHAMPION RETRIEVER

This stylish Black Labrador won the Fifth Annual Trials at Shelter Island Nov. 30 and Dec. 1-2. (Percy T. Jones)

ANN CURTIS, SENSATIONAL SWIMMER AT ANY DISTANCE

At 19, Miss Curtis holds more World and American swimming records than any other woman. (Wide World)

JAMES RAFFERTY, RUNNER OF THE YEAR, WINNING THE 1 MILE CHAMPIONSHIP

The Track Writers Association unanimously voted this former Fordham star the indoor season's outstanding athlete. He won 7 1-mile races, and was the fourth man ever to sweep the board in the Eastern indoor season (*Wide World*)

WILLIE PEP'S LEFT FINDS ITS MARK

Pep, world featherweight champion, was perhaps the most consistent performer among the prizefighters during the unsettled war years. (*Acme*)

cooks and bakers, radiomen, pharmacist's mates, radio technicians and drivers of motor vehicles who knew how to maintain their own cars. They were assigned to all districts except the Tenth (Porto Rico), and as demobilization began there were some 200 detailed each to the Honolulu and Ketchikan districts.

Following the surrender of Japan in August, port security responsibilities were confined to the supervision of the proper handling, movement, loading and unloading of explosives and other dangerous cargoes, and to fire-protection measures incident thereto. All other port security functions were to be eliminated as rapidly as possible except in the Fourteenth Naval District (Hawaii). The regulations for the security of vessels in ports and those for the protection of waterfront facilities were in process of being rescinded. All Captain of the Port personnel not required for explosive-loading activities and fire protection connected with them, were available for discharge or other utilization, and all surplus fireboats, patrol boats, and other port security facilities and equipment were made available for appropriate disposition. These port security forces had made an enviable record during the war in guarding America's ports. Over 4,000 vessels had loaded explosives under their supervision without a single major casualty.

During the war, lighted aids to navigation had been blacked out, dimmed or shielded and lightships removed to safety. Radio-beacons were silenced to prevent them from being of assistance to the enemy. As early as December, 1943, after the peak of the danger had passed, certain aids to navigation, particularly those in inland waters, were relighted. Even coastal and offshore lights were restored about this time in certain areas of the Pacific Coast where 632 lights and 26 lighted buoys had been extinguished. During the war 808 lights on the Atlantic and Gulf coasts also had been temporarily extinguished and 264 other lighted aids, mostly buoys, were temporarily replaced by unlighted aids. By the end of 1945 full authority for the restoration of peacetime operating conditions had been granted and the district Coast Guard Officers had reestablished practically all temporarily extinguished aids to navigation. A total of 36,213 aids to navigation were being maintained at the end of the fiscal year.

Having installed and operated a large network of Loran stations during the war, and also having had much experience with Radar, the Coast Guard now hopes to operate much of this equipment to facilitate the peacetime operations of the merchant marine. Loran, a system whereby a vessel may determine its position, even when 800 miles from the transmitting station in daytime, and 1,400 miles at night, utilizes pulse transmission, which permits measurement of the time of travel of the signals. An infinite number of lines of position are thus laced over the earth's surface by radio. Two shore stations operating as a Loran "Pair" lay down a set of these lines, and a Loran receiver indicator aboard ship, connected to an ordinary antenna, enables the navigator to select the pair of signals appropriate to his area. The difference in time of travel of the radio waves from two ground stations is measured and a line of position deduced from this time difference. Thus by making two or more readings on two or more pairs of signals, the navigator may obtain the ship's position. Radar, by providing the mariner with a "picture" of his surroundings on a screen, showing objects which may otherwise be invisible because of darkness or fog, offers many ad-

vantages. It will provide a means of detecting the presence of land, other vessels, or any obstruction from which its waves may be reflected. In navigating channels and harbors (restricted waters) the device will "pick up" buoys and similar aids to navigation. Rescue work will be speeded up by showing the position of the vessel in distress, eliminating much search time. In July, 1945, 64 fixed and 17 mobile Loran Stations were being operated by the Coast Guard. At the same time 45 RACON (Radar BeaCON) were under its operational control. These had been installed on the Atlantic and Pacific Coasts, and in Hawaii and Alaska, and give the distance and bearing within a maximum range of 120 miles of an airplane from such beacon, enabling any craft to navigate in all weather conditions, if fitted with the proper interrogation equipment. Considerable development work is being conducted by the Coast Guard to adapt or provide the radar beacon system for marine navigation. This development also includes all shore based radar aids to navigation such as radar reflectors. The rapidity with which merchant vessels install the necessary equipment will largely determine the more extensive use of these devices.

Under marine inspection laws the Coast Guard had certificated 1,627 new vessels aggregating over 9,000,000 gross tons during the fiscal year 1945. In addition 9,720 vessels had undergone annual inspections by Coast Guard marine inspectors during the same period. Merchant Marine Hearing Units operated in all important U. S. ports during 1945 and others located in Europe, Suez, Ceylon, the South and Southwest Pacific and the Canal Zone, investigated marine casualties and conducted examinations of personnel, issuing officers' licenses and seamen certificates.

The nine Coast Guard air stations along the U. S. coasts continued under the operational control of the various Sea Frontiers and served as task units in the conduct of Air-Sea Rescue. Their 165 planes rendered assistance in 686 plane crashes and saved 786 lives during the fiscal year 1945. Included among these were 11 Canadian airmen rescued by helicopter in Labrador. Training of helicopter pilots and maintenance crews continued.

In the last stages of the war in the Pacific, Coast Guard manning attack transports, LSTs, LCI(L)s and other vessels participated early in 1945, in important assault landings at Iwo Jima, Zamboanga, the Ryukyu Islands and Okinawa. Others landed on the shores of Japan and were present at the final surrender of Japan's armed forces in Tokyo in August.

RUSSELL R. WAESCHE

COLOMBIA. A republic of South America. Area: 439,825 square miles. Population: 9,620,800 (1943). Capital: Bogotá.

The Andes, intersected by high plateaus and deep river valleys, form the western third of the country; the remainder consists of plains watered by the Orinoco and Amazon Rivers. The climate varies with the altitude, low areas having tropical heat, plateaus temperate climate, and the high mountain regions cold to frigid temperatures.

Government. Under the Constitution of 1886, Colombia is a centralized republic of 14 Departments, 4 Intendencias, and 6 Comisarias. It has a bi-cameral Congress composed of a Senate of 63 members and a Chamber of Deputies of 131 members. The Congress holds two regular sessions a year; the first opens on Feb. 1 for 90 days and the second begins on July 20 and meets for

120 days. The President is elected for a 4-year term, and is aided by a Cabinet of 10 ministers. Alfonso López Pumarejo was elected President on Aug. 7, 1942 for his second term (he previously served from 1934-38). In August, 1945, President López resigned, and Dr. Alberto Lleras Camargo, First Presidential Designate, became President to complete the term ending Aug. 7, 1946.

The People. The majority of the population of Colombia is mestizo; the rest are persons of European descent (15 percent); Indians (10 percent); and Negroes (5 percent). The group of Negroes and Negro mixtures has been estimated at about 30 percent. Most of the people live in the Magdalena River valley in the mountain belt; population density is low in the coastal regions, and very low in the lowlands of the Orinoco and Amazon. Colombia's largest cities are: Bogotá, 395,000; Medellín, 198,000; and Barranquilla, 183,000.

The official language is Spanish. The predominant religion is Roman Catholic.

According to the census of 1938, 43.3 percent of the population over 10 years of age is literate. In 1941 there were 19,901 primary schools with a total enrollment of 685,317; 58,980 students were enrolled in 776 secondary schools; and 3,713 students were enrolled in 8 universities.

National Economy. Colombia is chiefly an agricultural country. The most important crop is coffee, of which Colombia is the second largest producer in the world. Other leading crops are: corn, sugar, bananas, wheat, rice, and potatoes. The pastoral industry is also of considerable significance. Coffee production for the 1944-45 season reached a total of 727,518,000 pounds. Estimated annual production of corn is 650,000 tons, and of potatoes, 418,000 tons. Estimated production of wheat in 1944 was 100,000 metric tons; of rice, 121,000 tons of paddy rice, or 65,045 tons of polished rice. Sugar production in 1944 totaled about 88,000 short tons.

Colombia has extensive mineral resources. Petroleum provides the second most valuable of the country's exports. Total crude oil production during 1944 amounted to 22,647,476 barrels, compared with 13,261,065 barrels in 1943. Colombia also produces gold and platinum; production in 1944 amounted to 553,531 troy ounces of gold, and 34,259 troy ounces of platinum. Copper, iron, and emeralds are also important mineral products.

There is little heavy industry, but Colombia manufactures a variety of products. The year 1944 was notable for continued commercial and industrial development. Principal commodities manufactured include: textiles, leather, beverages, cigarettes, glass, perfumery, cement, brick, pharmaceuticals, and clothing.

Foreign Trade. In recent years Colombia's foreign trade with countries in the Eastern Hemisphere has declined, while trade with western hemisphere nations has greatly increased. Total exports for 1943 were valued at 218,525,000, pesos. Principal products exported, by value, were: coffee, crude petroleum, dyed cotton cloth, cattle hides, cattle, and platinum. The U.S. received 85.6 percent of the total exports to western hemisphere countries. During the 1944-45 coffee quota year a total of 5,185,517 sacks of 60 kilograms each were exported from Colombia, of which 4,696,255 sacks went to the U.S., and 71,911 sacks to Europe. The value of coffee exported in 1944-45 exceeded 177,000,000 pesos. Exports of petroleum in 1944 were valued at 37,317,000 pesos.

In 1943 total imports were valued at 146,692,000 pesos; the U.S. was the principal source of supply. In that year leading imports by value were: raw cotton and waste, rubber tires and tubes, dyed wool yarn, cotton thread, newsprint, and wrapping paper.

Events, 1945. President Alfonso López was still under heavy fire as the year opened. In his New Year's message, he asked that a committee of the Chamber of Deputies investigate his Administration and his personal activities, "because only when its unmistakable judgment has been pronounced will the nation be relieved of impediments placed in its way." He declared that the opposition Conservative Party regarded him as an obstacle to harmony, referred to his recent offer to resign, and asserted that he was prepared to do anything necessary to subordinate partisan politics to the national interest. He added that the state of emergency which had been decreed during the abortive Pasto insurrection in July, 1944, would be lifted as soon as Congress had reviewed the Administration's acts during the emergency.

A special session of Congress opened on Jan. 22 to consider the emergency acts, constitutional reform, reorganization of the Army, and pending labor, petroleum and agrarian legislation. This session would mark the termination of the Pasto incident, López told the legislators. He warned that the country must face serious war and post-war problems and that it was possible that revolutionary activity was still afoot, and he urged political parties to stop quarreling over academic issues and to concentrate on vital problems. In conclusion, López praised the patriotic attitude of opposition congressmen, and expressed the opinion that partisan barriers between Liberals and Conservatives were tending to disappear, citing Conservative support of constitutional reform and other Administration-sponsored measures.

Presidential politics became an active issue on Jan. 27 when a welcoming demonstration, sponsored by the Liberal Party, greeted Gabriel Turbay, former Ambassador to the United States and presidential candidate, on his return to Bogotá. The National Directorate of the Liberal Party was reorganized on Feb. 3 to include former President Eduardo Santos, Turbay, Foreign Minister Darío Echandía, and Julio Roberto Salazar Ferro. Echandía's resignation to head the Directorate forced a Cabinet shift: Interior Minister Alberto Lleras Camargo became Foreign Minister and Education Minister Antonio Rocha was named Minister of the Interior.

The special session of Congress adjourned on Feb. 16 after having passed most of the Administration-sponsored measures submitted to it; but the resignation of Mines and Petroleum Minister Nestor Pineda was attributed to the Senate's failure to act favorably on proposed amendments to petroleum legislation. Another special session was called for May 2 to pass on measures taken during the state of seige, imposed July 10, 1944, which was officially lifted by presidential decree on Feb. 21.

The Government announced on Mar. 11 that it had discovered several hundred bombs and hand grenades in sacks hidden in the Bogotá cathedral. More than a score of persons were arrested, and Administration forces charged the Conservatives with plotting against the López regime. Archbishop Ismael Perdomo issued a formal statement in which he expressed the Church's disapproval of any subversive movement, and called the plot criminal and sacrilegious. The Govern-

ment announced that it regarded the affair "as an event of the gravest character, with ramifications in various parts of the country, and that it has taken precautions to assure the maintenance of public order." Some of those arrested were said to have been involved in the 1944 Pasto uprising. The Administration received messages of support from the National Manufacturers Association, the Bogotá Chamber of Commerce, and many labor unions. It stated that the Army was not involved in the plot; only five army officers were among those arrested, and they were later declared innocent and released. This incident occurred on the eve of elections in which the entire Chamber of Deputies and all 14 departmental assemblies were renewed. The significance of the poll lay in the fact that the Liberals elected played a major role in the party convention in July, at which the Administration's 1946 presidential candidate was selected. Eight hundred thousand voters—called a light turnout—went to the polls on Mar. 18. Official returns gave the Liberals 80 seats in the Chamber of Deputies, the Conservatives 46, and the Socialist Democrats (Communists) 5. Election trends were: a heavy increase in the Communist vote, and Liberal gains in the rural districts. Followers of Turbay claimed an intra-party victory. In the wake of the election, the Administration urged all persons who could do so to evacuate Bogotá, where the water shortage had become increasingly serious, in spite of the season's first rainfall on Mar. 21. Two days later all Bogotá schools were ordered closed temporarily as medical authorities warned of epidemics.

López attempted to set up the republic's first bipartisan Cabinet since 1934 on Mar. 30, when he appointed three Conservative leaders to ministerial posts: Roberto Urdaneta Arbaláez, member of the delegation to the Mexico City conference, was named Finance Minister; former Attorney General Rafael Escallón, Minister of Education; and Senator Manuel Barrera Parra, described as an "extremist" follower of Conservative Party chief Laureano Gómez, Minister of Mines and Petroleum. The Administration declared that this step was taken in conformity with the principles outlined in López's November 1944 message to Congress, in which he called for national unity to meet the problems of the transition period from war to peace. Urdaneta Arbaláez and Barrera Parra declined the appointments, however. One local Liberal leader declared that: "The appointment of the three Conservative Ministers disturbs the Liberal party without pleasing the Conservative party." The whole effort collapsed on Apr. 8, when Escallón reversed his earlier acceptance and declined appointment as Education Minister, declaring that his inclusion in a Liberal Cabinet would impede rather than aid national unity. The posts were filled by Liberal appointees.

The special session of Congress was postponed from May 2 to June 4 and later to June 25 to "study the laws necessary under agreements arising from the Mexico City and San Francisco international meetings."

Another terrorist plot, to which the authorities attached little political significance, was broken up on May 31, when six men were arrested and 20 pistols and a dynamite cache were confiscated. The Army and police were restricted to barracks and private telephone communication throughout the republic was suspended, but the country remained calm.

On the following day there was a mutiny in the Bogotá penitentiary, led by General Eduardo Bonitto and other army officers jailed as a result of the

1944 Pasto rebellion. They temporarily seized control of the prison and demanded the release of political prisoners, but the Government quickly regained control. Once again capital and labor organizations pledged support to the Government, and the Colombian Labor Federation called for action "to end, once and for all, these attempts by pro-Fascist forces." All army generals and officers of the Bogotá garrison called on the President on June 4 to assure him of their loyalty.

There were student demonstrations in Bogotá university during the second week in June, and on June 12 the Government, announcing the existence of a subversive movement, decreed a state of emergency in the capital. The decree provided for censorship of the press and communications, and prohibited public meetings. In a letter to the Attorney General, President López charged on June 13 that Conservative leader Gómez knew the names of industrialists, many of whom had pledged loyalty to the Administration after discovery of the last plot, who were backing the current subversive movement. Gómez refused to divulge his information to the authorities, López added. The National Manufacturers Association called the charges "too ridiculous to need denial."

The special session of Congress convened on June 25 and López told it that he was prepared to resign if this would "redeem the country from the unrest in which it has lived in recent months." He confessed that he was puzzled by the recent subversive outbreaks and declared that a new "reactionary campaign," marked by the clergy's re-entry into politics, had been launched, and that many Conservatives were defending convicted seditionists.

Former Foreign Minister Darío Echandía and Aníbal Badel, First and Second Presidential Designates, respectively, resigned on July 7.

Thousands participated in a pro-Administration Bogotá demonstration on July 10, anniversary of the abortive Pasto rebellion. Labor, banking, and the Liberal and Socialist Democratic (Communist) Parties vigorously rejected López's suggestion that he might retire, and the President assured them that the Government would maintain order at all costs; he called for national cooperation to adjust to postwar economic conditions. On July 17 the Senate rejected López's proffered resignation and passed a resolution promising the Administration "steadfast cooperation with measures tending to maintain calm in the country and strengthen its democratic institutions." But on July 19 López told the Senate that he was determined to resign. "What moves me to believe that my separation from the Government is indispensable," the President explained, "is the fact of not having attained my aims, although they have the copious support of national majorities."

In the midst of the presidential crisis, the regular session of Congress opened on July 20, the state of emergency in Bogotá was lifted on the same day, and the national convention of the Liberal Party began on July 22.

Followers of Darío Echandía withdrew from the convention when they failed to block a move to replace the plural party directorate with a single chief, and on July 25 Gabriel Turbay won the party's presidential nomination by a vote of 154 to 3. Echandía partisans announced that they would seek invalidation of the nomination. And one-time Labor Minister Jorge Eliécer Gaitán declared that he also was still in the race.

On July 27 Foreign Minister Alberto Lleras Camargo was elected First Presidential Designate by

122 congressional votes against 64 cast for Luis López de Mesa, thereby putting him in line to succeed López.

The President sent his formal resignation to the Senate on July 31, expressing the hope that his withdrawal from office would produce "fundamental change in political conditions to guarantee order, to fortify the civil administration and to create an atmosphere of tranquility for the great work of national collaboration in all public and private activities." The Senate on Aug. 2 accepted the resignation unanimously, and on Aug. 7 Lleras Camargo was inaugurated for the remainder of López's term, ending on Aug. 7, 1946. Lleras Camargo's inaugural speech confirmed the expectation that his interim Administration would devote itself to calming the country's troubled political waters. He would give all his time, the President said, to the study of vital problems and not to his personal defense, because he did not recognize "enemies within the fatherland." "I will cooperate closely with Congress during my term of office," he announced.

During the rest of the year, Colombia was chiefly preoccupied with party politics. The Liberal Party became more and more divided. Echandia withdrew from the presidential race on August 4 in order to avoid deepening the split in the party, which he said had been aggravated by the "hasty" nomination of Turbay. But Eliécer Gaitán remained an active opponent of Turbay, and his strength was said to be growing as time passed, particularly among the workers. The light Liberal vote cast in municipal elections on Oct. 7 was called favorable to him, for he had asked his followers not to participate. Meanwhile the Conservatives postponed a final decision on their part in the 1946 election, apparently waiting to capitalize on Liberal disension. When a provincial Conservative newspaper proposed a candidate, leader Laureano Gómez characterized it as carrying on "intelligence with the enemy."

Laureano Gómez made another characteristic gesture in November, when he resigned from the Senate committee which advises the Foreign Ministry because its Liberal members were in favor of asking Ecuador to extradite Capt. José Gregorio Quintero. Quintero was the officer who shot and killed Gen. Julio Guerin when the general refused to take part in the Pasto revolt. Quintero was arrested but escaped from jail and fled to Ecuador. The Government maintained that the captain was a common criminal and hence subject to extradition. Gómez said he was a political refugee because he had been tried by a court martial.

The country faced a labor crisis late in the year when 12,000 boatmen on the Magdalena River went on strike. The river is a life-line of Colombia, since the river boats carry most of the goods which move between the coast and the interior. For this reason Colombians have always feared such a strike, which the boatmen's Communist-dominated union has often used as a threat. The demands of the strikers seemed unreasonable and apparently political in nature. The firmness with which the young interim President met the challenge and ended the strike greatly increased his political stature.

HARRY B. MURKLAND.

COMBINED CHIEFS OF STAFF—United States and Great Britain. Establishment of the Combined Chiefs of Staff was announced by the War Department on Feb. 6, 1942. Under the direction of the heads of the United Nations, the Combined Chiefs of Staff collaborated in the formulation and execution of policies and plans concerning (a) the strategic

conduct of the war; (b) the broad program of war requirements, based on approved strategic policy; (c) the allocation of munition resources, based on strategic needs and the availability of means of transportation; (d) the requirements for overseas transportation for the fighting services of the United Nations, based on approved strategic priority.

U.S. Members: Adm. W. D. Leahy, Chief of Staff to the Commander in Chief of the Army and Navy; Gen. Dwight D. Eisenhower, Chief of Staff, U.S. Army; Adm. C. W. Nimitz, Commander in Chief, U.S. Fleet, and Chief of Naval Operations; Gen. H. H. Arnold, Commanding General, Army Air Forces.

British Members: Field Marshal Sir Henry Maitland Wilson, Head of British Joint Staff Mission in Washington; Adm. Sir James Somerville; Lt. Gen. Sir G. N. Maccready; Air Marshal Douglas Colyer.

COMBINED FOOD BOARD—United States, United Kingdom, and Canada. A Board created on June 9, 1942, by the President of the United States and the Prime Minister of Great Britain, to obtain a planned and expeditious utilization of the food resources of the United Nations in order to coordinate further the prosecution of the war. In October, 1943, the Canadian Prime Minister accepted membership in behalf of Canada. U.S. Member: Clinton P. Anderson, Secretary of Agriculture.

COMBINED PRODUCTION AND RESOURCES BOARD—United States, Great Britain, and Canada. A Board created by the President of the United States and the Prime Minister of Great Britain on June 9, 1942, for the most effective use of the combined resources of the United States and the United Kingdom for the prosecution of the war. It was expanded on Nov. 10, 1942, to include a Canadian member. The function of the Board is to determine the availability and sources of supply for finished products (other than raw materials and foodstuffs) required in liberated areas and to coordinate production and allocation.

Members: United States, J. A. Krug; Great Britain, Stafford Cripps; Canada, C. D. Howe.

COMBINED RAW MATERIALS BOARD—United States and Great Britain. A Board created Jan. 26, 1942, by President Roosevelt and former Prime Minister Churchill to mobilize the raw material resources available to the United States and United Kingdom for the most effective combined use against the enemy. On Jan. 20, 1945, the charter of the Board was reaffirmed and continued for the duration of the war. The Board is composed of the following: United States Member, William L. Batt, and Executive Secretary, R. B. Whiting; United Kingdom Member, Sir Henry Self, and Executive Secretary, H. O. Hooper.

The activities of the Board included over-all review of the supply and requirements position of the United Nations for the major critical and essential raw materials, allocation of supplies of scarce raw materials among the United Nations when necessary, recommendations aimed at expanding supplies and conserving the use of raw materials in short supply, coordinating the purchasing activities of the United States and Great Britain in foreign raw material markets, and the adjustment of the day-to-day raw materials problems which have been referred to or initiated by the Board.

COMBINED SHIPPING ADJUSTMENT BOARD—United States and Great Britain. A Board created in 1942 to adjust and harmonize the work of the British Min-

istry of War Transport and the War Shipping Administration.

COMMERCE, Department of. A Department of the U.S. Government, created in 1903 as the Department of Commerce and Labor. The activities of the Department include population, agricultural and other censuses; collection, analysis, and dissemination of commercial statistics; promotion of foreign and domestic commerce; coastal and geodetic surveys; establishment of commodity weights, measures, and standards; supervision of the issuance of patents and the registration of trade-marks; the establishment and maintenance of aids to air navigation, the certification of airmen, the inspection and registration of aircraft, and the enforcement of rules and regulations issued pursuant to the Civil Aeronautics Act of 1938; supervision of the issuance of weather forecasts and warnings for the benefit of agriculture, commerce, and navigation including weather service for aviation, and the publication of climatic statistics; development of inland waterway transportation, and supervision of the operation of government-owned barge lines, and numerous other functions concerning these activities and related subjects.

The Department of Commerce as at present constituted, with the Office of the Secretary, includes:

Bureau of the Census
Civil Aeronautics Administration
Coast and Geodetic Survey
Bureau of Foreign and Domestic Commerce
Inland Waterways Corporation
Patent Office
National Bureau of Standards
Weather Bureau

Secretary in 1945: Henry A. Wallace; Under Secretary, Wayne C. Taylor.

COMMODITY CREDIT CORPORATION (CCC). An agency under the War Food Administration of the U.S. Department of Agriculture, established as an independent agency in 1933, transferred to the War Food Administration, Apr. 19, 1943, and later, June 29, 1945, placed again under the control of the Department of Agriculture. It has an authorized capital of \$100,000,000.

The Corporation is empowered under its charter to buy and sell, lend upon, or otherwise deal in agricultural or other commodities. To finance these activities, it is permitted, under the act of Apr. 12, 1945, to borrow by the issuance of obligations guaranteed by the U.S. and not to exceed \$4,750,000,000.

Prior to the outbreak of World War II the Corporation was engaged principally in making loans to farmers on agricultural commodities stored on farms and in warehouses. Objectives were to help stabilize the prices of farm products, bring about the orderly marketing of farm products, and to accumulate supplies during years of abundance for use in years of shortage. Following the outbreak of war, operations were expanded to help increase the production of food, feed, and fibers for war needs. To this end numerous loan, purchase, and sales programs are now in operation. Commodities include practically all the food and feed grains, vegetable-oil crops, some truck crops, cotton, hemp, and naval stores.

The Corporation finances the purchase of food, feed, and fibers for Lend-Lease export, and helps to finance the domestic production of commodities formerly imported, and disposes of surplus food and of farm commodities for export at competitive world prices, pursuant to the Surplus Property Act of 1944.

Commodity Credit Corporation loans outstanding on all commodities totaled 415 million dollars on May 31, 1945, compared with 781 million on Mar. 31, 1943. Loan stocks included less wheat, corn, tobacco, naval stores, but more cotton than in March, 1943. Commodities owned by CCC totaled 763 million dollars on Mar. 31, 1944, compared with 885 million on Mar. 31, 1943. These commodities included wheat, tobacco, sugar, soybeans, cotton, and imported and domestic fats and oils.

President in 1945: Frank Hancock.

COMMONWEALTH FUND. This endowment, established in 1918 by Mrs. Stephen V. Harkness "to do something for the welfare of mankind," and later increased by gifts from the founder and from Edward S. Harkness, president of the Fund from its inception until his death Jan. 29, 1940, now amounts to approximately \$47,333,000. Appropriations in the year ended Sept. 30, 1945, were \$1,644,216.90. Activities tending to promote or maintain physical and mental health accounted for three quarters of this total. More than \$375,000 was appropriated for medical research. In medical education, fellowships were offered for advanced study; provision was made for visiting instructors in medical schools; aid was given to departments of preventive medicine and psychiatry, to teaching arrangements designed to promote interplay between medicine and psychiatry, and to various forms of postgraduate instruction for men in practice. Public health activities, designed to raise standards of rural service, centered in Tennessee, Mississippi, and Oklahoma. Fourteen rural community hospitals built or remodeled with aid from the Fund were at work during the year; these hospitals stress opportunities for professional education as well as standards of medical, nursing, and technical services. Personnel shortages remained general and embarrassing. The Commonwealth Fund Fellowships for British graduate students at American universities were suspended during the war, but fourteen fellowships for postgraduate study in medicine and public health were awarded in 1944-45 to Latin-Americans. The Fund published in the year eight new books of educational significance in its fields of operation. Since the beginning of the war the Fund has appropriated some \$1,500,000 for war relief and other purposes related to war needs, including the rehabilitation of men discharged from the armed forces with psychiatric disabilities. The directors of the Fund are: Malcolm P. Aldrich (president), William E. Birdsall, Phil W. Bunnell, Adrian M. Massie, Lewis Perry, Barry C. Smith, William E. Stevenson, and Thomas D. Thacher. Its offices are at 41 East 57th Street, New York 22, N. Y.

COMMUNICATIONS, Electrical. Wartime controls of international communications were rapidly and progressively relaxed following the cessation of hostilities. Principal exceptions at the year-end were occupation zones in Europe and in the Orient. Most of the major international channels had been reopened to commercial traffic and some new channels established in spite of limited availability of materials. Most ship-to-shore services were restored.

A 12-day telecommunications parley was concluded Dec. 4, 1945, between U.S. Government and British Empire delegates. Agreements reached should go a long way to expand communications throughout the world. Subject to approval by the

Foreign offices of the several British Commonwealths and to approval in the U.S. by both the State Department and the President, the agreements included the following points:

1. A World ceiling of 30 cents per word was established for full-rate messages and 20 cents for code messages. Proposed to be effective April 1, 1946, this new rate compares with present rates of \$1.05 per word from New York to Sarawak; to Singapore, 89 cents; to Bombay, 46 cents; to South Africa, 50 cents; to Ceylon, 48 cents. Proposed new press-rate ceiling of 6½ cents per word compares with such present rates as 18 cents per word from San Francisco to Bombay.

2. The gold franc was abandoned as the medium of payment and measure of telecommunications charges, in favor of the dollar on the basis of the pound sterling at \$4.03. Other countries may adopt the dollar-sterling basis by reciprocal agreements with the U.S. and the Commonwealths.

3. A protocol was signed between the U.S. and the United Kingdom acknowledging certain existing "exclusive arrangements" pertaining to telecommunications for certain other countries, but agreeing to discourage exclusive arrangements in the future.

Radar. Radar ranks second only to the atomic bomb in its significance as a wartime combat tool and in the extent to which its development and use were closely guarded military secrets. Radar as a word is coined from the contraction of the "radio detection and ranging" equipment and system to which it applies. Descriptively, radar can be defined as a powerful electronic "eye" which by means of ultrahigh-frequency radio impulses and echoes of these impulses accurately determines the presence and exact location of objects in space, under total darkness or other conditions which would prevent these objects being located by visual means. Specifically, a radar system: 1) generates ultrahigh-frequency high-powered electric waves, or pulses; 2) projects these waves or pulses from an antenna, in a closely controlled and usually very narrow beam—like a searchlight beam; 3) picks up the echoes of these waves or pulses that are reflected back by the objects upon which the rays impinge—again, similar to the seeing of an object by means of the light reflected back by it from a searchlight beam; 4) converts these echo pulses into a visible pattern on the fluorescent screen of a cathode-ray tube, the versatile tube long used in industry for many things including television viewers. Related electronic devices accurately time the intervals between outgoing pulses and incoming echoes, and thus accurately measure the distance to the reflecting object (for the impulses and returning echoes travel in a straight line and at the speed of light, 186,000 miles per second.) Other devices guide the reflector-like antenna to follow an enemy objective automatically even though both searcher and object may be in rapid motion.

Broadly classified, the hundred or more different types of radar fall into two general categories: 1) the "search" types, which sweep over wide and distant areas to detect the presence and approximate location of a target; 2) the "fire control" types which precisely locate, and accurately aim guns or bombs at, targets unseen by the gunners or bombardiers, assuring that the missiles will reach those targets even if they are moving. Both functions are combined in some radars, which employ relatively lower frequencies (longer wavelength) for broad searching and relatively higher frequencies (shorter wave lengths) for the more

accurate determination of exact location of the target. Refinements in search radars led to the development of equipment which put on the viewing screen in front of the operator the equivalent of an animated map, revealing ships, shore lines, islands, rivers, buildings, roadways, and other objects within the field of "view." This equipment, enabling the airplane operator to "see" otherwise invisible targets and surrounding objects, and enabling the pilot of a surface vessel to "see" otherwise invisible shorelines and other objects, was of especial importance to wartime air and marine navigation, and holds wide possibilities for peacetime navigation.

Radar enabled the embattled and outnumbered Royal Air Force fighter pilots to fend off the German air blitz of Britain. It opened the way for the Normandy landing. It enabled the destruction of German and Japanese war industry. It contributed greatly to the mitigation of the German buzz-bomb blitz on England. It sought out Japanese ground installations, ships, and planes from Guadalcanal to Tokyo. Germans and Japanese also had military radars, many of them reflecting excellent technique. They were, however, outclassed by the combined research of British and American scientists coupled with the mass production capacity of American industry. Wartime radar was exceedingly big and expensive business. Individual sets ranged from \$5,000 to \$90,000 in cost and from 35 tons or more for a land based set to about the weight of a man for airborne equipment. Radar equipment deliveries to the Army, Air Forces, and Navy up to July 1, 1945 totalled \$2,700,000,000; divided \$1,000,000,000 for airborne equipment, \$800,000,000 for ground equipment, \$500,000,000 for shipborne equipment, and \$400,000,000 for development and other miscellaneous related costs.

Radio. As radio broadcasting celebrated its 25th birthday in November, 1945, the promise of its near future included: the rapid development of a nationwide system of frequency modulation (FM) broadcasting stations, with static-free radio reception for the listener; facsimile broadcasting, and corresponding facsimile reception in home radio sets; rapid development of nation-wide television networks, with the capability of full color transmission and greatly improved quality of received image; a nation-wide system of high-powered clear-channel standard amplitude-modulated (AM) broadcasting stations, at intervals throughout the country on a plan designed to provide radio service to remote rural areas not now satisfactorily served.

Assignment of new frequency bands for FM broadcast was made in mid-year by the Federal Communications Commission, jumping the allowed frequency from the range 42–50 megacycles up to the range 88–108 megacycles. This decision was strongly contested by most equipment manufacturers and radio broadcasters alike, because it made obsolete all existing equipment. FCC stoutly defended its decision, however, stating that in the newly assigned frequency range, FM would have ample space to expand and would be troubled with much less mutual interference. This newly assigned frequency range will provide 100 FM broadcasting channels which, according to FCC, should accommodate something like 10,000 FM broadcasting stations in the United States, as compared with approximately 900 present standard (AM) stations. About a half-million FM home receivers and 33 commercial FM broadcasting stations will require equipment conversions to enable them to operate in the new frequency bands. Estimated cost for this conversion ranged from \$10 to \$20 for

each receiver and about \$10,000 for each broadcasting station.

Frequency modulation is a system of broadcast developed and long promoted by Major Edwin H. Armstrong of Columbia University, New York, N.Y. In this system, the electrical impulses which carry the speech or music signals through the ether are of constant amplitude but vary in frequency according to the instantaneous nature of the signal; in the standard or amplitude-modulation system, the frequency is constant and the amplitude varies. The important difference is, from the standpoint of the listener, that all manner of "static" ranging from thunderstorms to electric razors, are amplitude-modulated impulses and hence are picked up in the AM system and interfere with broadcast reception, whereas all such disturbances automatically are screened out by the FM system.

With 600 applications for FM broadcast licenses currently before it, and expecting from 2,000 to 3,000 more within the next five years, FCC divided the United States into two areas. Area I comprises southern New Hampshire, all of Massachusetts, Rhode Island, Connecticut, New Jersey, Delaware, and the District of Columbia; South-eastern New York as far north as Albany-Troy-Schenectady; Maryland, east of Hagerstown; and Pennsylvania east of Harrisburg. Area II comprises the remainder of the U.S. FCC also designated three types of stations: metropolitan, community, and rural. Metropolitan stations are limited to 20,000 watts effective radiation, and are required to have antenna 500 feet above the highest point of the local terrain within 10 miles. (In FM broadcasting, the height of the transmitter antenna largely controls the distance range of the station, as the signal transmission characteristic is similar to that of light or vision, and does not go beyond the horizon.) Community stations, designated to serve the smaller areas, are limited to 250 watts effective radiated power, with antenna heights of 250 feet. Rural stations, for service in widely scattered rural areas and smaller communities, will be allowed to have power as high as 200,000 watts effective radiation. In Area II, all three types of stations will be permitted. In Area I, because of the relative proximity of cities in this heavily populated area, only the metropolitan and the community classes of stations will be permitted.

Facsimile broadcasting received very little public attention during the war, but the military services were very much awake to its possibilities, and marked progress was made. Encouragement to facsimile broadcasting is given by FCC through its permission for FM channels to be used for such transmission when channels are not required for rural broadcasting. In Area II, the frequency range 106-108 megacycles has been allocated to facsimile broadcasting until such time as that service is transferred to its eventual place at 470-480 megacycles. Further impetus to facsimile broadcasting was given by the announcement in December, 1945, by a company that it had recently installed on top of a New York City skyscraper a new type of antenna and that within a month test broadcasting would be undertaken, with regular transmission of news, cartoons, pictures, and other printed matter to follow. It is the opinion of FCC engineers that facsimile broadcasting systems and receiving equipment will be developed rapidly as labor and materials become available.

Radio telephone developments, as distinct from radio broadcasting, made great technical strides under the pressure of wartime requirements. Adap-

tation of these to commercial and other telephone service already has begun. Two demonstrations were made in New York City in the fall of 1945, showing the practical application of theretofore secret microwave radio relay equipment originally designed for military service, to meet commercial communication requirements including telephone, telegraph, facsimile, and teletypewriter service. The Bell Telephone Laboratories demonstrated equipment known to the Army and Navy as AN/TRC-6 calling attention to it as the first and only American-built microwave radio relay communications system to have seen actual combat use by the armed forces, and one which had distinguished itself in both European and Pacific theatre service. The equipment uses radio frequencies of the order of 5,000 megacycles. In conjunction with similar equipment at Neshanic, N.J., 40 miles away, the equipment accommodated the simultaneous transmission of 6 telephone conversations, a facsimile transmission of a weather map, and 18 teletype messages. By looping the circuits, the equivalent of a 2,800-mile airline radio relay telephone circuit was demonstrated. Similarly, the Federal Telecommunication Laboratories, Inc., gave a demonstration of 24 simultaneous two-way telephone conversations over an 80-mile microwave relay circuit including two repeaters and operating at 1,300 megacycles on a single carrier frequency. Both these equipments utilized the pulse-time system of modulation, as distinct from amplitude modulation or frequency modulation. Pulse-time modulation was described briefly in the YEAR BOOK for 1944.

Plans for a general mobile radio telephone service which would bring the advantages of two-way voice communication to drivers of motor vehicles were announced by the American Telephone and Telegraph Company, in connection with the filing of applications with the FCC for authority to install such radiotelephone stations in Baltimore, Chicago, Cincinnati, Columbus, Denver, Houston, Milwaukee, New York, Philadelphia, Pittsburgh, St. Louis, Salt Lake City, and Washington, D.C. In addition, it announced that surveys are being made to determine the need and feasibility of mobile radio telephone service in many other cities and along certain highways of the U.S. The proposed system contemplates that subscribers' vehicles will be equipped with low power (15 watt) transmitters and receivers operating on fixed wavebands. The links between these mobile units and existing wire telephones will be through radio "central offices" which will be higher-powered (250 watts) transmitters and receivers erected at strategic points around a city, or along highways for rural or inter-city service. Effective range of such equipment would be limited to a 25 to 35-mile radius. Other possibilities for mobile radio telephone equipment includes bus, truck, and taxi fleets; large farms and ranches; railroads; and public utilities. Both utilities and railroads have been experimenting for some years with the use of mobile communications equipment, with eminent success, and are expected to pursue their programs more actively as equipment becomes available.

A radar-type of communication systems operating at 2,660 megacycles is to be installed on 160 miles of the Chicago Rock Island and Pacific Railway's double-track line between Chicago and Rock Island, Ill. By the end of the year, the FCC had recognised railroad-radio service, by issuing rules and regulations for the establishment of its Railroad Radio Service effective December 23, 1945. A featured provision of the proposed rules was that

eligibility for operating licenses in railroad-radio service will be confined to common carriers. Frequencies allocated by the FCC for this service are in the range from 158.43 megacycles up to and including 161.97 megacycles. Experiments conducted in collaboration with the Denver and Rio Grande Western Railroad enabled the new Rock Island communication equipment to be tested in actual operation through the Moffat Tunnel near Denver. Communication signals were reported to be constant and entirely satisfactory at all times through the tunnel, indicating that for the first time trains may pick up clear audible communication signals even while passing through tunnels and deep gorges, something that was impossible with prewar communications equipment. Radio communication tests, first begun by the Great Northern Railway in 1925, were resumed on a 30-mile section of the GN lines on the Mesabi Iron Range in Northern Minnesota, where communication is to be established between crews of ore train locomotives and several stations along the line.

Telegraphy. Indicating conviction that radio relay systems operating at the super-high frequencies, developed for such secret war projects as the military radar systems, will supersede conventional wired systems on heavy-traffic telegraphic circuits, Western Union Telegraph Company announced in October, 1945, that within the next 7 years it expects to link all major U.S. cities by radio relay. Only 6 months after setting up its first experimental circuit between New York and Philadelphia, Western Union thus was ready to proceed with a program that will make obsolete hundreds of thousands of miles of wire circuits in its present 2,300,000-mile telegraphic network. In their place will rise radio relay towers at intervals of around 30 miles (since radio relay depends upon line-of-sight transmission, spacing will vary according to terrain). Next step in the program is an enlarged "experimental" system interconnecting New York, Pittsburgh, and Washington, application for the operation of which was made to the Federal Communications Commission. This step is expected eventually to permit removal of some 2,500 miles of pole lines, 54,000 miles of wire and 160 miles of aerial and underground cable, between these three cities.

Each leg of the proposed circuit will have radio beams in each direction, each beam able to handle up to 1,080 telegrams simultaneously. The radio relay facilities, however, are expected to be used in part for other types of transmission, including facsimile, leased telegraph networks, and private telephone circuits for company use. Reports current at year-end indicate that the proposed change-over on major traffic circuits could be accomplished as far west as Kansas City within 5 years. The program is part of \$62,000,000 in Western Union improvements for which plans are definitely scheduled. The present New York-Philadelphia radio relay operates at a frequency of 4,000 megacycles. The new system is expected to use frequencies between 3,000 megacycles and 15,000 megacycles. Frequency modulation is employed, under a license agreement with Major Edwin H. Armstrong, holder of FM patents.

The 2,670-mile submarine Commercial Pacific cable between Midway and Guam, severed by the United States Navy as a security measure when war broke out with Japan, was restored to service December 21, 1945. Although the severed ends of the long cable line had been marked miles out to sea and tied to buoys, reports indicate that it was no small task to find and reassemble them. The

Army cable repair ship "Restorer," appropriately named, did the job. Before the war, this cable carried from 500,000 to 750,000 messages annually to Asia and key Pacific points.

Telephony. As the year 1945 closed, the United States telephone industry had accumulated approximately 2½ million applications for telephone service which could not be filled for lack of facilities; in addition, another half-million unfilled applications for residence extension telephones, and proportionately large numbers of applications for teletype and other services required for business and industry.

The postwar program of the Bell System lists the following: (1) Catching up with unfilled requests for service, which in turn, means extension of telephone switchboard, line, and other facilities to accommodate new telephones, etc.; (2) Replacements of temporary wartime expedients, and resumption of the prewar program of replacing obsolete equipment (for example, about 2½ million of the obsolete desk-stand type of telephone instruments remained to be replaced when war interrupted the rehabilitation program, and, in addition to those, about a million such instruments were returned to service to meet wartime needs); (3) Extending and increasing the capacity of the long-distance network covering the U.S., including provision for television and the use of ultrahigh-frequency radio relay equipment originally developed for the use of armies in the field; (4) Resumption of the program of replacing manual equipment by dial-type equipment, for local service, and extension of direct-dialing for short- and medium-distance toll calls; (5) Extension of two-way telephone service to such fields as motor vehicles, railroad trains, and coastal marine craft, also expansion of facilities for direct international overseas radio-telephone service; (6) Extension of facilities to bring telephone service to most American farms.

With reference to this latter point, Bell System resumed late in 1945 its prewar experiments in co-operation with the Rural Electrification Administration toward the development and establishment of a satisfactory system for superimposing telephone service on rural electric power lines by means of a small version of the high-frequency carrier system utilized on long high-voltage power transmission lines. Experimental installations have been made. The possibilities of radio, improved under war pressure, for remote rural telephone service also are to be investigated. With about a million rural customers now served and another million expected to be served by the Bell System within the next five years, and with parallel activity by the local independent elements of the U.S. telephone service industry, the great majority of American farms should have telephone service available to them by 1950 if not before.

Long-distance telephone lines steadily have been going underground over a period of many years. As of the end of 1945 about 70 percent—some 25,000 route miles—of the basic nation-wide network of interconnected telephone toll cable is underground. An additional 10,000 miles is planned by the Bell System for the next few years. Most important element in the extension of toll cable facility is the new transcontinental coaxial-cable line reported in the YEAR BOOK for 1944. Termination of the fighting of World War II has enabled this program to be expedited, the objective now being to reach Los Angeles with the new all-coaxial-cable line by the spring of 1947. Present plans for the coaxial-cable system call for four interconnected "Backbone" routes: 1) Atlantic Seaboard, from

New York to Miami via Atlanta; 2) Southern transcontinental, from Atlanta to Los Angeles and San Francisco; 3) Mid-western, from the east coast, probably Washington, to Chicago via Pittsburgh and Cleveland, with branch from Cleveland to Buffalo; 4) North-south route from Chicago to New Orleans via St. Louis and Memphis, intersecting the transcontinental route at Jackson, Miss. By the year-end about 2,000 of the approximately 7,000 route-miles of coaxial cable required for this project had been manufactured, and 1,500 miles of it was in the ground. As this cable becomes available, it is being installed in those locations which most urgently require additional toll-circuit facilities, thus at once meeting current needs and also providing successive elements of the ultimate plan. The system will accommodate television broadcast distribution as well as long-distance telephone service. A single pair of coaxial units can accommodate 480 telephone circuits. The cables being laid include up to 4 such pairs.

Another type of facility which also may prove important in strengthening the U.S. long-distance telephone network is the ultrahigh frequency (or also known as "microwave" or "microray") radio equipment developed for military use during the war. The Bell System has obtained FCC approvals for the experimental "radio-relay" system between New York and Boston, announced in the YEAR BOOK for 1944. As this radio system is limited to line-of-sight range, seven intermediate radio repeater stations are planned between New York and Boston. This experimental system will apply in the field of radio a principle long established on long-distance telephone lines: the insertion of amplification or "repeater" equipment at intervals along the whole length to bolster the signal strength and compensate for transmission losses. It was, for example, the application of repeater units to wire lines that in 1915 made possible the first direct transcontinental telephone conversation. Similar radio relay equipment is scheduled for early and extensive use by Western Union to replace long distance wire telegraph lines (q.v.).

Long-distance rates again were reduced effective July 1, 1945, by the Bell System, applying to calls over 790 miles. Example station-to-station daytime rates: Between New York and San Francisco, reduced from \$4.00 to \$2.50; between New York and Denver, reduced from \$3.25 to \$2.35.

Special telephone arrangements made for the United Nations Conference on International Organization held in San Francisco beginning April 25, 1945, are of some interest. By April 15 a special installation identified as "International 3300" was functioning. Traffic grew to some 23,000 toll calls per day, including some 4,200 really long-distance calls which represented about a 10 percent increase in the system load of long-haul calls. Five new "K-carrier" systems were added by Bell System to increase by 35 percent the long-haul talking circuits terminating at San Francisco. In addition to 16 teletypewriter circuits previously in use to San Francisco, 21 private-line teletypewriter circuits were added, 10 from New York, 3 from Chicago, and one from Dallas, principally for newspaper services; 7 from Washington, principally for government use. A flood of special radio programs also was distributed over wire lines from San Francisco, in addition to the other communication services.

Interesting wartime developments, tardily reported for security reasons, included announcement of successful wire laying from an airplane, and the completion of a new telephone line from Central Washington to Southern California, located

east of the Cascade and Sierra Nevada Mountains for security from enemy attack. For use in jungle areas and other inaccessible territory, a system was developed whereby 15 miles of telephone wire could be laid from a transport airplane operating at 150 miles per hour, both ends dropped by parachute to ground signal troops. In tests conducted in 1944 in the United States, a direct wire-telephone conversation was established for the first time between ground forces and airplane crew, lasting for the 4 or 5 minutes while the remainder of the wire was being paid out. In 1942 the Pacific Telephone and Telegraph Company built 892 miles of new pole line, added new cross-arms to 425 miles of existing pole lines, and strung 7,700 miles of wire to provide a north-south Pacific Coast telephone tie-line from Yakima, Wash., to Danby, Calif. This emergency line intersects all the east-west trunk lines and roughly parallels the Main Pacific Coast long-distance trunk line, but from 100 to 300 miles farther east, putting high mountain ranges between it and the coast then threatened with Japanese invasion. The line routing was established by aerial photo-survey made from heights of from 17,000 to 22,000 feet, which proved to be so accurate and revealing that 95 percent of the original route was unchanged by the subsequent ground surveys which opened the way for actual construction.

Indicative of the extent to which telephone equipment, in addition to all other signal and communication equipment, was used in War operations, is the Navy report that in a single landing operation against a Jap-held Pacific stronghold the 700 odd ships participating were equipped with more than 48,000 telephones using more than 1,000 miles of telephone cable of various sizes. Requirements for each ship of typical classes were given as follows:

Ship	No of Telephones	Feet of Cable
Battleship—Iowa Class	1,556	155,600
Carrier—Essex Class	1,358	135,800
Light Cruiser—Cleveland Class	902	90,200
Destroyer—Fletcher Class	230	23,000
Destroyer—Escort	169	16,900
Attack Transport	200	20,000
Landing Ship—Tank	63	6,300
Landing Ship—Medium	32	3,200
Landing Craft—Infantry—Large	11	1,100
Motor Torpedo Boat	10	1,000

Television. In its re-allocation of the spectrum of operating frequencies for radio communication, the FCC allotted to television 13 channels below 300 megacycles, and also 28 channels above 400 megacycles for future use. In view of the line-of-sight transmission characteristics of television broadcast, the new 13-channel system is adequate to accommodate about 7 stations in the New York City metropolitan area, and at least one each in the 140 other major cities and towns in the United States. Successful demonstration of 525-line color television in the frequencies above 400 mc lead to the expectancy that network color telecasts soon may be on a daily basis. Further, engineering reports indicate that television will not be ready for complete service to the public before some time in late 1946 or early 1947, and that in the meantime experiments with the superior results of the higher frequencies well may be expected to swing television to those frequencies by public demand. Such an event would appear to benefit frequency-modulation radio broadcast as much as television, by releasing to the seemingly unlimited potential of FM the frequency ranges now assigned to television. This school of thought was bolstered by a

successful demonstration in December of three-dimensional full-color television broadcast at 10,000 megacycles, about 20 times as high up the frequency spectrum as even current experimental television broadcasting. A terrific tussle is going on in the television industry between the proponents of immediate activation of television systems on the basis of black-and-white pictures and presently developed frequencies, and the proponents of holding off for a few more months to enable development of the superior and broader qualities (color and sharp definition) of the ultra high-frequency ranges pioneered so successfully under military necessity. The crux of the matter is that if the public buys expensive sets for the one, they won't work on the other. One demonstration was the telecasting of New York City's Navy Day Dinner at the Waldorf-Astoria Hotel under conditions of ordinary low-level ballroom lighting. In another demonstration, an "Image Orthicon," made sensitive to infra-red radiation, penetrated visual darkness to pickup and televise a model "illuminated" only by invisible infra-red radiation.

Many industrial and commercial applications suggest themselves for this new television tube. For example, the new camera could televise the melt in a steel mill where the control of subvisual temperatures is important. Again, a department store in Philadelphia indicated a commercial application by using the equipment in its store auditorium to pickup and send to 20 viewers in different parts of the store various equipment demonstrations, costume modelings, and other visual sales aids calculated to attract customer attention. Development of the Image Orthicon began shortly before the war, but the adaptation of the supersensitive camera to various military needs vastly expedited its perfection.

Another noteworthy technical refinement in television is the adaptation of the ultrahigh-frequency pulse-transmission characteristics of military radar to enable both the audible and the visual signal impulses of telecast transmission to be made on a single frequency instead of on separate frequencies as heretofore. This simplification would reduce the duplicate transmitting station equipment now required, and correspondingly reduce the complexity and cost of receivers. The operating principle is to transmit alternately a "pulse" of energy for the visual part and a "pulse" of energy for the audible part of a sight-and-sound telecast, and to do this so rapidly (15,750 times per second) that, through the human quality of persistence of vision and persistence of hearing, both sight and sound produce the effect of being continuous and unbroken.

As 1945 came to a close, some important technical problems remained to be settled before the public could expect to settle down in front of versatile and dependable home receivers with desirable assurance against excessive obsolescence resulting from technical developments or trade competitions. Sets were being announced, ranging from table-top models with 5 x 7-inch viewing screens at about \$100 to "home theater" models at \$1,500 complete with 8 x 4-ft. screen and radio-phonograph combinations including FM. At least two projects had been announced contemplating public "television theaters." A bed-ridden litigant "appeared" in a Los Angeles court to give testimony via television and radio. Inaugurating an experimental program of intercity telecasting via one link in the Bell System's growing network of coaxial-cable trunk lines, the Army-Navy football game in Philadelphia December 1 was "piped" to

New York and there telecast. Tests were scheduled to be made of the broadcasting of television and FM radio programs from an airplane operating about 30,000 feet above the earth. Proponents of the experiment were hopeful of showing that the line-of-sight limitations characteristic of both television and FM broadcasting could be offset and the effective radius operation of a single station increased from 25 miles to 200 miles. A low-powered ground station would transmit programs to the plane which would rebroadcast them simultaneously.

G. ROSS HENNINGER.

COMMUNISM. Neither the theory nor the practice of Communism in 1945 can be discussed without reference to the Soviet Union. In the minds of the great majority of Americans, Communism simply is the system of politics and economics now existing in the Union of Soviet Socialist Republics. Communists themselves, of course, do not make such a claim. Communism, in the sense of the classless society predicted by Marx and Lenin, remains a goal to be achieved. They do insist, however, that Russia is following the one and only path to Communism, and this faith in the Soviet Union is so strong that they are more directly influenced by its practices than they are by Marxist-Leninist theories. Since the dissolution of the Communist International in the spring of 1943, there have been no official ties between the Communist Party of the Soviet Union and the Communist parties of other countries. Whether there have been secret connections is in effect an academic question, for the Communists of other lands habitually seek, with or without directives, to co-ordinate their policies with those of the U.S.S.R. A few individuals, notably disciples of the late Leon Trotsky, regard themselves as true Communists and charge the followers of Stalin with departing from the teachings of Marx and Lenin. To the members of the Communist Party this is heresy of the rankest kind. As they see it, a great Communist victory was achieved in Russia in 1917, and since then the principal duty of all Communists has been to preserve the gains thus made. They look on Russia as a mighty fortress of the Communist cause, which must be held at all costs. Though plans of world revolution may not have been theoretically abandoned, they have necessarily been pushed into the background, while attention is focused on the immediate needs and purposes of the Soviet Union.

It follows that the most important Communist phenomenon of 1945 is the emergence of the Soviet Union as one of the world's two great powers. This phenomenon, as we shall see, has had a vast influence on Russia's neighbors in Europe and Asia. It has also strongly affected public opinion in the United States. On the one hand, with the growing realization that the chief threat to peace in the coming decades is the possibility of a clash between the United States and Russia, many influential Americans, whatever their political views, have made a strong effort to bring about better relations between the two countries. For example, the politically conservative New York *Herald-Tribune* devoted one entire session of its 1945 forum on world problems to the U.S.S.R., and selected several speakers known to be sympathetic to that country. On the other hand, the new manifestations of Soviet power have inevitably intensified fear and distrust. In some quarters hostility has been openly expressed, but more important than the sporadic heckling of

the Soviet Union or the open talk of war is a deep undercurrent of suspicion.

The Nature of Soviet Communism. The influence of the Soviet Union upon the development of Communism throughout the world is obvious. The problem is to characterize the political and economic system that actually exists within Russia today. For one thing, it is as difficult as ever to obtain objective information. For another, the system cannot be described in a single word or phrase.

Certain statements can be made with some assurance. In the first place, the government continues to be a dictatorship. It is true that Russian leaders and publicists invariably refer to the government as a democracy. *Pravda*, for example, described it as "a much higher form of democracy than any other form of power known to history," and Commissar Molotoff, in his speech on the 28th anniversary of the revolution, spoke of "a true democracy of the people." Representative institutions, however, continue to function only in nominal ways. On June 22, for instance the Supreme Soviet met in its 12th session and listened to the Chief of Staff's proposal for demobilization. The next day the Supreme Soviet unanimously approved this proposal and adjourned. The Communist Party is still the only party permitted to exist in Russia, and there is no opposition press. An elaborate campaign preceded the elections of February, 1946, though there was only a single slate of candidates.

Some other tendencies may be noted. Inequality of income, which greatly increased in the 1930's, apparently has not diminished during the war. Many privileges that were granted to women in the early years of the revolution have been withdrawn, and Soviet officials have pointed with satisfaction to the resulting rise in the birth rate. Although there is no evidence of a rebirth of religion, the Greek Orthodox Church has been given increasing freedom during the war, and the Church on its part has loyally supported the government. In May, Patriarch Alexei of Moscow thanked God for Stalin and spoke of the Orthodox Church's "complete unity with the government." Nationalist sentiment, which was on the increase before the war, was naturally stimulated by the conflict with Germany, which is officially referred to as the Patriotic War. David Dallin, in the *New Leader* for Nov. 24, 1945, finds evidence of a retreat from nationalism, and predicts a conflict between military and political authorities on this issue. The nationalist note, however, is still strong in various publications that have reached the United States from Russia. Molotoff's speech on the anniversary of the revolution, which made no allusion to Marx and only a single reference to Lenin, praised Stalin as a great national leader.

The tendencies mentioned are at least in apparent conflict with the conceptions of Communism advanced by Marx and Lenin. On the other hand, there is not the slightest indication of a restoration of capitalism in any ordinary sense of that word. The means of production are firmly in the hands of the state, and there appears to be no prospect that they will be relinquished.

Russia's Sphere of Influence. In the European countries that lie close to Russia, a clear pattern of Communist activity has emerged. In the first place, the Communist Party itself has nowhere taken power. Power is held by a united front, usually composed of leftist parties and elements of the resistance movement. This united front, however, is dominated in varying degrees by the

Communists, and usually Communists—often men who have spent some time in the Soviet Union—serve in key positions. Complete nationalization of the means of production is never the program of these united front governments, but they commonly adopt reforms in land ownership. Sometimes no opposition to the united front is permitted. Collaborationists and fascist sympathizers are liquidated or suppressed, and there is some evidence that critics of Soviet policy are likely to be classed as pro-fascist. Friendship with the U.S.S.R. is always the basic article of foreign policy.

This is the system that operates in Yugoslavia, Czechoslovakia, Poland, Bulgaria, Rumania, and Albania. In a modified form it operates in Finland. Something of the same sort was established in Hungary and Austria after the liberation of those countries, but the situation, as is noted below, was changed by the November elections. The situation in Germany is still obscure, but in the Russian zone the Communist Party is one of four anti-fascist parties recognized by the occupation authorities, has a large representation on the Berlin City Council, and is negotiating with the Social Democratic Party with regard to the formation of a single Workers' Party.

It is in Czechoslovakia and Yugoslavia that "revolution from above," as the system has been called, has functioned most efficiently. The Czech government in exile, which from the first had emphasized its friendship for the U.S.S.R., was welcomed to Prague soon after the liberation. A National Bloc, made up of Communists, Social Democrats, and National Socialists, controls the government. Communists hold 90 out of 300 seats in Parliament and 4 out of 11 cabinet posts.

In Yugoslavia the resistance movement was for some time divided, but Marshal Tito (Josip Broz), a Communist, had won his struggle with General Mihailovich before the liberation of the country was completed. By the time Tito's Partisans linked up with the Red Army in September, 1944, his supremacy was generally recognized at home and abroad. Most observers agree that many of Tito's followers are not Communists, but they also agree that Communists play a large part in his government. Of the five most influential cabinet members in the autumn of 1945, three were avowed and two were alleged Communists. In the voting on Nov. 11, 1945, for members of the constituent assembly, the voters were offered only a single slate, inasmuch as opposition parties had decided to abstain from the election on the ground that it would not be free; 90 per cent of the votes cast favored Tito's Fatherland Front.

In Poland conflict continued throughout 1945. The Polish Committee of National Liberation, which had established itself in Lublin in July, 1944, with the participation of the Communist Party and the support of the Soviet Union, proclaimed itself the Provisional Government of Poland early in 1945. This government was transferred to Warsaw soon after the liberation of that city, and was expanded to include Stanislaw Mikolajczyk, a Peasant Party leader, and other representatives of the Polish emigrés. The free elections to which the Soviet Union, Great Britain, and the United States agreed on July 22, 1945, have not yet taken place.

In Rumania, after the fall of the Radescu government on Feb. 28, 1945, the National Democratic Front took power with Petru Groza as premier. Iuliu Maniu, leader of the National Peasant Party, the largest party in the country,

has opposed the Groza government. On Nov. 8 rioting took place, and the Communist press charged Maniu, among others, with being responsible. Shortly afterward it was reported that the Peasant leader had disappeared. The Minister of Justice and the Minister of the Interior in the Groza government are Communists, and Vasile Luca, a member of the political bureau of the Rumanian Communist Party, is secretary general of the National Democratic Front. After the Moscow meeting of foreign ministers, the Cabinet was reorganized to include a Liberal and a representative of the Peasant Party.

In Bulgaria there is a Fatherland Front, in which the Communists originally cooperated with the Social Democrats and the Zveno, a left-wing agrarian party. By the summer of 1945, however, many non-Communist elements in the front were moved to protest against Communist domination and to ask the Allied Control Commission to supervise the election scheduled for Aug. 26. After the protest of Great Britain and the United States, the election was postponed, but, in spite of further protest, it was held on Nov. 18. Critics of the Communist Party urged their followers to boycott the election, but Sofia and Moscow announced that 80 percent of the electorate voted and that 3 out of every 4 votes favored the Fatherland Front. When reorganization of the Cabinet was undertaken, in accordance with the decision of the Moscow Conference, the opposition wings in the Agrarian and Social Democratic Parties urged that the Ministries of Interior and Justice should go to non-Communists "so that the freedom of Bulgarian citizens can be guaranteed."

In Finland the Democratic League—made up of Communists and some dissident members of the Social Democratic Party—polled 408,658 votes in the election of March 17 and 18, some 24 percent of the total; 49 members of the Democratic League, 40 of them Communists, hold seats in the Finnish parliament, and six members of the League are in the cabinet. Ville Pessi, general secretary of the Communist Party, states that it has 20,000 members. One of its major aims is the encouragement of an alliance between Finland and the U.S.S.R. Yrjö Leno, Communist Minister of the Interior, controls the police and the censorship.

In general it may be said that Communist parties have gained in strength everywhere in Eastern Europe. It is doubtful, however, if they are anywhere in the majority. In Hungary, indeed, on Nov. 4, they polled only 17 percent of the votes cast, and in Austria two weeks later only 5 percent. Even in these countries, however, they have been given cabinet positions in spite of their poor showing, and elsewhere, as has been pointed out, their power is out of proportion to their numerical strength. To explain this, sympathetic observers say that Communist leadership in the various left-wing fronts was won by heroic activity in the struggle against the Nazis, that the disfranchisement of fascist elements is both just and necessary, that Communist land reforms are deservedly popular, and that admiration for the Soviet Union is naturally strong in the emancipated countries. On the other hand, it is charged that the Communists, after seizing strategic positions, have used their power to prevent the expression of opposition and have established virtual dictatorships.

If it is asked whether the Soviet Union has actively interfered in the domestic affairs of Eastern European countries, one can only say that

the evidence is confused. In another quarter, however, in Iran, there seems to be a clear case of Soviet cooperation with local Communists. The separatist movement in the northern province is the work of the Democratic Party of Azerbaijan, whose leadership is openly Communist. When Persian military forces acted to suppress this separatist movement, they were checked by the Red Army.

Elsewhere in Europe. The end of the war found Communism stronger almost everywhere in Europe. In some countries the gains, though relatively large, did not entitle the Communists to major influence. In Sweden, for example, they claimed 35,000 members, as opposed to 18,000 in 1939, but were weak in comparison with the Social Democrats. In Denmark, in the autumn of 1945, they increased their representation from 3 to 18, but remained the smallest of the major parties. In Norway they won only 7 seats in the Storting, as against the Labor Party's 75.

In France, on the other hand, the party claimed a million members and led all other parties in the election of Oct. 21. This extraordinary showing may in large measure be explained by the energetic and courageous part played by Communists in the resistance movement. The emergence of the Communist Party as the strongest single party in the National Constituent Assembly created immediate difficulties, for it was the party's request for certain cabinet posts that led to General de Gaulle's threat of resignation. Although a compromise was found, the Communists bitterly resented de Gaulle's suggestion that their primary loyalty was to the Soviet Union, and it seemed certain that the issue would arise again. In domestic affairs, as France moved towards nationalization of basic industries, the Communists took a position slightly to the left of the other parties.

In Italy the Communist Party is led by Palmiro Togliatti, who returned from Russia soon after the invasion. Communists were active in the National Committee of Liberation, which coordinated the resistance movements in northern Italy prior to the completion of the war. As cabinets have come and gone, the Communists have shown themselves rather more moderate than the Socialists. They oppose the monarchy, but believe that action should be postponed until a peace treaty is signed and an election held.

In Spain the Communist resistance movement is said to number some 20,000 active members. Communists have also participated in negotiations regarding the establishment of a Spanish government in exile. In September, when representatives of the various anti-fascist parties met in Mexico, the Communists strongly supported Juan Negrin. When Giral was chosen prime minister of the government in exile, the Communists refused to enter the cabinet.

The situation in Greece is of particular interest because Russia has apparently recognized that Greece belongs to Britain's sphere of influence. The Soviet Union remained silent when Britain intervened in the civil war of the winter of 1944-45, despite the fact that Communists were active in the National Liberation Front (E.A.M.) The Communists have continued to agitate against British interference and against the return of King George. The Union for Popular Democracy and the Socialist Party have lately withdrawn from the E.A.M., but it continues to have a considerable following.

England is almost the only European country in which the Communist Party did not make signif-

icant gains in 1945. Communists polled only 102,780 votes in the general election of June, and elected only two members of Parliament. It should be observed, however, that by and large the Communists supported the Labor Party and contested only 21 seats. At the general convention of the party in November, Harry Pollitt, its secretary, vigorously criticized the foreign policy of the Labor government and demanded the removal of Foreign Secretary Ernest Bevin. At the same time he warned against unnecessary strikes, saying that industrial peace was needed to keep Britain in the front rank of world powers.

United States. On May 20, 1944, the Communist Party of the United States was dissolved by vote of its national convention, and the Communist Political Association was created. Earl Browder, for many years general secretary of the party, was elected president of the association. "American Communists," Browder wrote in *Teheran*, "are relinquishing for an extended period the struggle for partisan advancement for themselves as a party. The Communists foresee that the practical political aims they hold will for a long time be in agreement on all essential points with the aims of a much larger body of non-Communists, and that therefore our political actions will be merged in such larger movements." In the year following, American Communists exerted a restraining influence on whatever movements they participated in. They exhorted labor unions to keep the no-strike pledge, tried to persuade Negroes and other minorities not to press their demands, and indicated their willingness to cooperate with the most conservative politicians and business men so long as these were not hostile to the Soviet Union.

Then, almost a year to the day after the formation of the Communist Political Association, the *Daily Worker*, Communist newspaper, published a translation of an article by Jacques Duclos, a leading French Communist, that had appeared in *Cahiers du Communisme*. "Nothing justifies the dissolution of the Communist Party of the United States," this article said, accusing Browder of "deviations" and "dangerous opportunist illusions." In an introduction to the article as it was published in the *Daily Worker*, Browder stated that it unquestionably reflected "the general trend of opinion of the European Marxists in relation to America." He announced that there would be open discussion and then a meeting of the national committee.

In the discussion that followed in the party press, one Communist after another approved of Duclos' criticisms. Leaders of the party admitted that they had been at fault but held Browder principally responsible. On June 2 the national board of the Communist Political Association took steps to reestablish the Communist Party and adopt a more militant program. Browder alone opposed this action. William Z. Foster, leader of the Communist Party in the 20's and a persistent critic of Browder's position, was commended for his fight against opportunism. Three weeks later the national committee, by a vote of 53 to 1, approved the actions of the national board, described Browder as "the chief architect of revisionism," and called a special national convention for July 26.

In the controversy that preceded the convention Browder accused Foster of "the purest anarcho-syndicalism," and Foster replied by calling Browder a "bourgeois reformist." Other critics pointed to the decline Communist activity and

the decay of morale that had taken place during the period of "Browderism." John Williamson stated that the Communist Political Association had few members in basic industries, that discipline had been lax, and that the payment of dues had declined.

Unlike the convention of 1944, the special convention held its sessions in private. Browder continued to defend his position, but announced that he would abide by the decisions of the convention. In a long report Foster accused Browder of abandoning Marxist and Leninist theories, of setting up a personal dictatorship over the party, and of plotting a world-wide revisionist movement. Browder was formally removed from office, as were Robert Minor and James Ford. The Communist Party was reestablished, and Foster was named chairman.

Some time will be necessary before one can perceive how far to the left the Communists are swinging. At a meeting of the national committee on Nov. 18, Foster said, "Our party is reestablishing its policy upon a Marxist-Leninist basis, has put itself in line with actual economic and political conditions. It is basing itself upon the firm conclusions that imperialism is not dead but very much alive; that the class struggle remains decisive in capitalist society; and that there is an indispensable need of the Communist Party to lead the struggle of the masses." The reassertion of the decadence of capitalism and the necessity of socialism has become prominent in the Communist press, and there has been more emphasis on American imperialism than at any time since the German attack on Russia. There has also been some slight revival of talk about a labor party. Communists have conducted a vigorous campaign for the withdrawal of American troops from China, and have been intensely critical of Secretary Byrnes's policy towards the Soviet Union. In the strike situation that developed in the winter of 1945-6, Communist influence seemed to be exerted on the side of militancy.

When the new policy was being discussed, some observers held that the change would affect the New York City elections by weakening all organizations linked in any way with the Communists. On July 23 Benjamin B. Davis, Jr., Communist and Democratic candidate for councilman, announced a more militant Communist policy with regard to Negroes, and the Democratic endorsement was withdrawn. However, Davis was elected to the city council, and so was Communist Peter Cacchione of Brooklyn. The two American Labor Party candidates regarded as being closest to the Communist Party—Eugene Connolly and Michael Quill—were also elected.

Other Events. Several times during the year Communists figured in the news. In February the *Chicago Tribune* revealed that the Army was permitting Communists to receive officer training if there were no evidence of disloyalty, and this policy was defended by Asst. Sect. of War John J. McCloy. In March the board of directors of Freedom House refused a gift of \$5,000 from the Communist Political Association for the Wendell Willkie Memorial Building Fund. On June 19 the Supreme Court refused to uphold the order for the deportation of Harry Bridges, Australian born leader of labor on the West Coast. The court held that cooperation in the legal activities of a subversive organization did not in itself constitute subversiveness. In October Louis Budenz, editor of the *Daily Worker*, announced that he had been converted to Catholicism, had left the Commu-

nist Party, and would teach economics at Notre Dame University.

Elsewhere in the Americas. In most Central and South American countries Communists were active during 1945. Particular interest attaches to events in Brazil and Venezuela. Getulio Vargas, who had been strongly anti-Communist at the outset of his regime as president of Brazil, became more conciliatory as the time for elections drew near, and the Communists supported him until the very eve of his overthrow on Oct. 29. In the elections of Dec. 2, the Communist candidate for the Presidency won 600,000 votes, or 10 percent of the total. The Secretary of the Party, Luis Carlos Prestes, long imprisoned by Vargas, has become an important political figure.

In Venezuela, also, Communists appeared to be on the side of the status quo, supporting the government of Gen. Isaías Medina, which was deposed by the army on Oct. 18. The revolutionary Junta subsequently released Rudolfo Quintero, a leading Communist, who was imprisoned at the time of the revolution.

China. Nowhere was the situation more important or more confused than in China. At the end of the war with Japan, Chinese Communists dominated an area inhabited by 80,000,000 people. During the war there had been repeated conflicts between the Communists and the Nationalists, and civil war seemed likely to follow the surrender of Japan. However, agreements between the U.S.S.R. and the Chinese central government with regard to Manchuria eased the situation, though Chiang was forced to make considerable concessions to Russia. Then, in January, 1946, representatives of the Communists and the central government, in consultation with United States Ambassador Marshall, succeeded in arranging a truce, and, though friction has continued, the unity of China seems to be a possibility.

Many American observers have been impressed by the Chinese Communists' heroism, their self-sacrifice, their fanatical devotion to a cause. Moreover, so experienced a student as Owen Lattimore, one time adviser to Chiang Kai-shek, maintains that the Communist regime has been successful. The Communists, he says, are backed by most of the people in the area they control. Food and clothing are better in this area than in other parts of China, and the incidence of taxation is more equally distributed. Moreover, the political structure is more democratic. By a ruling adopted in 1941, Communist Party members may fill only one-third of local offices.

The question of the Communism of the Chinese Communists has been much discussed. Harrison Forman, for instance, stated in *Report from Red China*, "Chinese Communists are no more Communist than we Americans are." According to Liu Shao-chi, head of the political bureau, "The Communist Party's program for China at present is one of democratic capitalist development based on state, private, and cooperative enterprise." Most observers agree that the policies of the Communists are now moderate enough, but the party's leaders make it clear that they regard democratic capitalism as a transient phase that will eventually give way to socialist collectivism. "China's revolution," stated Mao Tse-tung, the chairman of the party, in 1941, "is a magnificent part of the world revolution."

It should be remembered that in 1945 immediate collectivization was not a Communist demand anywhere in the world. Allowing for elements in the Chinese situation that are wholly

unique, one can perceive the same basic pattern that has been discerned elsewhere. The present demand is for a coalition of progressive elements to work for a program of moderate reforms, but ultimate goals are not forgotten though they are not stressed. Moreover, though the Soviet Union's behavior with regard to China's intestine quarrels seems to have been circumspect, the close relationship between Chinese Communists and Russia is obvious. Mao Tse-tung was a member of the Communist International prior to its dissolution, and before Russia was involved in the war, he denounced it as an imperialist struggle. Speaking of China's war with Japan, he said, in 1941, "Without the help of the Soviet Union, final victory is beyond imagination." At the end of a long controversy with Lin Yutang in the *Nation*, Edgar Snow, a staunch admirer of the Communist regime, wrote, "There is also no doubt that the Chinese Communists are very close in their sympathies to the U.S.S.R. and that during the war they have sought to defend Soviet policies." In the progress that has been made towards peace in China, both the Soviet Union and the United States have played a part. So far as the Chinese Communists themselves are concerned, it may be fair to say that they have chosen to work for influence in the whole of China instead of maintaining their exclusive rule in a portion of the country.

Elsewhere. In Japan the Communist Party is small but growing. At first it urged the removal of Emperor Hirohito, but subsequently modified its position in the interests of forming a People's Front. In Korea, although the Communist Party has only 7,000 members, it has demanded an important role in the government. Soviet publications have approved the independence movements in Indonesia and Indo-China, and there are Communists among the leaders of the uprisings in both countries. In the Philippines Communists won considerable influence by their participation in guerrilla warfare against the Japanese, and have agitated for agrarian reform. To all the peoples along Russia's Asiatic frontier, writes Owen Lattimore, the Soviet Union has "a great power of attraction." In their eyes it stands for "strategic security, economic prosperity, technological progress, miraculous medicine, free education, equality of opportunity, and democracy." And this, as Mr. Lattimore concludes, is a powerful combination.

GRANVILLE HICKS.

COMMUNITY CHESTS AND COUNCILS, Inc. A national membership association of community and war chests and councils of social agencies, organized in February, 1918, as a national clearing-house of ideas and service for community chests and councils of social agencies. For description see *YEAR BOOK* for 1939. Of the 1,142 chests and councils in operation in August 1945 (820 chests and 322 councils), 784 chests and 303 councils were in continental United States, 4 chests and 2 councils in Hawaii, 29 chests and 17 councils in Canada, 2 chests in South Africa, and 1 chest in the Virgin Islands. Almost every city in the United States (except New York City, which has a limited joint financing organization) in 1944 had a community chest or similar plan of federated financing for its voluntary social services. In 772 cities in 1944 more than twenty million contributions, totalling \$221,272,950, were given to community chests and war chests to be used during 1945 for voluntary social work in their communities and for National War Fund agencies.

Officers of the association for 1945 are: Honorary President, Gerard Swope; President, E. A. Roberts; Vice Presidents, J. B. Adoue, Jr., H. L. R. Emmet, Mrs. DeForest Van Slyck and Harry P. Wareham; Treasurer, Milton H. Glover; Secretary, Robert P. Lane. Address: 155 East 44th Street, New York 17, N. Y.

COMMUNITY TRUSTS. Charitable trust funds aggregating \$67,041,684 were reported by 76 community foundations in the United States and Canada at the beginning of 1945. Their resources were \$45,000,000 in 1935 and \$13,500,000 in 1925. The New York Community Trust administers 62 funds totaling \$15,871,000, the Chicago Community Trust stands at \$11,498,000, followed by the Cleveland Foundation with \$8,624,000, and the Winnipeg Foundation with \$3,561,000. Philanthropic outpayments by these trusts in 1944 rose to \$1,981,000 from \$1,739,000 in 1943. The most sizable disbursements were in New York, \$558,746; Cleveland, \$279,000; Chicago, \$268,000; and Boston, \$256,000. The largest receipts of funds by community trusts in 1944 occurred in New York where \$4,650,000 was received. Additions in Los Angeles were \$723,000; in Chicago, \$675,000; and in Hartford, \$500,000. Three new community trusts were created in 1944 in Columbus, Ohio, Spartanburg, North Carolina, and Champaign, Illinois.

Community trusts ordinarily place investment responsibility in trustee banks designated by contributors, and lodge distributional power in a citizens' committee authorized—also by the donors—to adapt its disbursement policies to the evolving requirements of current social needs. This procedure is designed to avoid obsolescence and keep funds effectively employed despite changing conditions.

The New York Community Trust, with Ralph Hayes as Director, has offices at 120 Broadway, New York City.

COMPTROLLER OF THE CURRENCY, Bureau of the A. Bureau of the U.S. Department of the Treasury which has general supervision over national banks; established 1863. Comptroller: Preston Delano.

CONCILIATION SERVICE, U.S. The function of the Conciliation Service, in the United States Department of Labor, is the settlement of labor-management disputes through voluntary methods of conciliation, arbitration, and technical surveys. The fiscal year 1945 followed the pattern of the other war years and brought an increased case load to the Service, raising the number of cases handled from 5,599 in the fiscal year 1941 to 25,907 in 1945. The regional offices have been increased to seven located in Boston, New York, Atlanta, Cleveland, Chicago, Kansas City, and San Francisco.

The Conciliation Service handles all types of cases: strikes, lockouts, threatened strikes, controversies, and sundry disputes. Any representative of labor, management, or the public can secure the services of a Commissioner of Conciliation by writing, wiring, or phoning the Regional Director of the Service in the region in which the dispute occurs or by contacting the Washington Office. The Service now has a staff of 275 Commissioners of Conciliation, chosen for their knowledge and experience in the field of labor-management relations. They are stationed in the important industrial and commercial centers of the country.

When a Commissioner of Conciliation enters a

case, his first efforts are directed toward getting a clear picture of the whole situation, followed by efforts to persuade the parties to settle their differences by compromise rather than by an appeal to strike or lockout. This involves the following: (1) interviews with both parties; (2) plans for joint conferences; (3) removal of the conference table from scene of conflict; (4) open consideration of issues involved; (5) establishment of off-the-record feeling of confidence through informal conversations; (6) acceptance of points of mutuality; (7) maintenance of status of Commissioner as impartial negotiator; (8) encouragement of conflicting groups to work out their own solutions.

Nearly 26,000 cases were handled by the Service during the fiscal year from July 1, 1944, through June 30, 1945, involving more than 14½ million workers. Strikes and threatened strikes involving 3½ million workers accounted for more than five thousand of these cases. The majority of these situations were settled by the Service alone, but a little more than one-fourth could not be settled by the normal mediation and conciliation processes and were referred or certified to the National War Labor Board for final determination under its extraordinary wartime authority. With the closing up of the War Labor Board and labor relations divisions of the military and war agencies, the Conciliation Service faces 1946 as the only federal agency, aside from those dealing with railway disputes, responsible for maintenance of industrial peace throughout the country.

The facilities of the Service were used in 28 major industrial fields, such as building trades, manufacture of food, iron and steel, textiles, transportation equipment, etc., and were utilized by employees and employers in 48 States, the District of Columbia, Alaska, Puerto Rico, Hawaii, and the Virgin Islands.

EDGAR L. WARREN.

CONGREGATIONAL CHRISTIAN CHURCHES, The General Council of the. A general council was instituted at Seattle, Wash., June 27, 1931, when the National Council of the Congregational Churches in the United States and the General Convention of the Christian Church merged their activities in this new organization. The next biennial meeting of the General Council will be held at Grinnell, Iowa, June 18-25, 1946.

The headquarters of the General Council of the Congregational Christian Churches are at 287 Fourth Avenue, New York City. Those of the Board of Home Missions are at the same address, with offices also at 14 Beacon St., Boston, Mass., and those of the American Board of Commissioners for Foreign Missions at 14 Beacon St., Boston, Mass.

The present membership is 1,113,930, a net increase of 20,650 over the previous year, the largest net gain for some years. The total number of additions for the year was 70,928. The Church School enrolment is 489,677, a decrease of 14,554. This decline is accounted for by two facts, first, many young persons of church school age are in the armed services, and while absent their names are withdrawn from the roll. Second, the church school has been changing its emphasis, and has become a school for children and youth rather than a general meeting of the people old and young. For older persons the church now provides other educational activities, in which 3,417 churches reported enrolment of 566,866. The churches raised for local church support \$17,467,525, and for benevolences \$3,350,919.

CONSTRUCTION INDUSTRY. With the end of the war in Europe (May) and in the Pacific area (August) this industry turned away from its varied war activities and faced the problems of a postwar or transition period, to be followed, let us hope, by a permanent peace economy. In the three months following the surrender of Japan the value of the industry rose to such an extent that its record for the 11 months of 1945 was \$2,051,399,000, as against \$1,636,196,000 for the same period in 1944. While difficulties are inevitable, there should be great reservoirs of employment quickly ready to serve the men returning to civil life. During the war great numbers of projects were postponed and others already under way were halted, while at the same time the normal growth and development of new projects was interrupted. Important features of this industry are its wide range of employment (unskilled, skilled, technical, and administrative), and the great volume and value of its work.

Recognition and approbation are due to the engineering and construction men in the armed forces for their astonishing work in preparing the way for advance movements, cooperating with the advance, and keeping supplies and communications up with the front. After which it was necessary to provide roads, bridges, airports, docks, water and sewerage facilities, barracks, camps, hospitals, and a hundred other services. The Army (Corps of Engineers), the Navy (Seabees) and the Marine Corps all shared in this work.

In the present transition period many restrictions and controls affecting and hampering the construction industry have been relaxed or removed. But to some extent their places have been taken by other unfavorable factors, such as labor unrest, price regulations, and shortages of men and materials. However, a number of public and private projects halted by the war are now being started or resumed.

One result of wage controversies has been uncertainty as to future wage scales, so that bids for contracts tended to rise as a means of insuring against future conditions. But this step has reacted in some cases by leading to the rejection of bids considered excessive. On the other hand, a number of contractors in New York city declined to bid on certain contracts imposing severe penalties for delays due to labor troubles. This led to modification of the objectionable terms.

In view of the widespread construction activities of various Government departments, the President in July signed a bill for coordination of the programs of these agencies. To provide agricultural and industrial development, and also a large field of employment, the Bureau of Reclamation (Department of the Interior) with its vast program of irrigation and power development, has presented to Congress an inventory of 415 new projects. The Corps of Engineers (U. S. Army) also has a large program of civil improvements planned. It was estimated in October that projects that could be put in hand at once represented \$833,538,200 for flood control and \$67,077,800 for river and harbor work, while by the spring of 1946 additional works would be ready for contract to the extent of \$450,571,165 for rivers and harbors and \$143,383,800 for flood control. These are but two examples of U. S. Government work.

A report of the American Society of Civil Engineers considers that there should be a \$15-billion plan for new construction ready for contract during the first postwar year; 66 percent for private works and 34 percent for public works. About half of

the private work would be commercial and industrial structures, the other half residential housing. But in July the Director of War Mobilization and Reconversion reported that plans then ready were insufficient for the amount of work necessary to provide employment. It has been stated that in this industry the preliminaries in advance of the blueprint stage consume 66 percent of the total time, while the actual construction takes only 34 percent.

Since the delay and dilatoriness in disposing of preliminaries for putting work under contract have become apparent, many projects must wait. Another cause of delay is that many local projects are held back while the authorities endeavor to obtain Federal financial aid. This short-sighted policy on matters which should be local responsibility led to a recommendation by a committee of Congress that Federal aid should not be provided for financing State or local public works at least for the first year of peace.

In figuring on prospective construction the U. S. Department of Commerce estimated that for the period June 30, 1945 to July, 1946, manufacturers had planned plant and equipment to cost \$4,500,000,000, while railroads and public utilities planned \$1,500,000,000 for expansion of facilities. But on the basis of actual definite projects, the estimate of *Engineering News-Record* was \$1,816,000,000 for factories and industries, \$344,000,000 for railroads, and \$700,000,000 for public utilities, a total of \$2,860,000,000. According to the Federal Works Agency (Office of Economic Research) the dollar volume of construction activity through the autumn of 1945 continued at \$425,000,000 per month, as increases in non-military work compensated for the decline in military work. The figures of the Federal Works Agency for the three years 1944, 1945, and 1946 are given in Table I.

had on hand in January detailed records of engineering construction projects totaling \$28,000,000. And out of this list a number of projects valued at \$500,000,000 had already advanced to the active status of contracts awarded. These records are considered to form tangible evidence that heavy construction can continue to expand at its fastest previous rate of 50 percent per year and still not exhaust this backlog of needed projects before 1950.

The question of manpower or labor supply is a serious factor. The war took away thousands of trained and experienced men, and these men must be made available as soon as possible while troops are being disbanded. At a conference of representatives of a score of organizations held at Washington in June, the principal objectives were: (1) to coordinate the rights and aids provided by the Federal Government and some State governments, with a view to furnishing the industry with trained men; (2) to help veterans interested in engineer-

ing and general construction to obtain additional technical education or training. There were at that time in the armed forces approximately a million men of this class engaged in combat or in military engineering work; 700,000 in the Corps of Engineers, U.S. Army, and 300,000 in the Seabees, U.S. Navy. Besides these there were thousands in other branches of the service.

Among all these are many who will wish to continue in engineering and construction work, and colleges and vocational schools are providing suitable studies and courses. There is the need for men for jobs, and the need of jobs for men returning from the war activities, together with a need for completion of interrupted training or for additional training to enable men to advance. Many skilled men were employed in non-skilled though necessary work while in the service. A factor that has slowed the program of getting men back to jobs has been the slow rate of discharge from the forces.

In view of the growing importance of this industry, the U.S. Department of Commerce in 1945 established a construction division having the following objectives: (1) promoting rapid expansion of the industry; (2) reaching a higher annual volume of work than in the postwar period; and (3) maintaining a more even annual volume of construction.

E. E. RUSSELL TRATMAN.

CONSUMERS' COOPERATIVES. Further acquisition of productive plant by central cooperative organizations, a continuation of the diversification process that has been under way for several years, a lively appreciation of the importance of educational work, and greater interest in the strengthening of international ties marked 1945 for the cooperative movement in the United States.

With the announced purpose of providing cooperatively in each locality as many goods and services as possible, cooperators made considerable progress in the commodity field and were showing unusual enthusiasm for new services such as cold-storage lockers, medical and hospital care, and housing. An "unprecedented" number of requests for assistance in organizing new associations was reported. Gains were noted in the expansion of cooperatives in the cities. Developments among the commercial federations were mainly in the direction of acquisition of new plant (especially productive plant); further strides were made in the production and refining of crude oil. Steps were also taken for strengthening the cooperative structure by greater coordination of activities, particularly at the national level.

Preliminary reports indicate increases in membership and business of both local (retail) and wholesale associations, and a determined drive for greater business efficiency. Cooperative leaders are painfully aware of the pitfalls inherent in the artificial prosperity of war economy and in the uncertainties of the postwar period, and are striving to avoid them by obtaining greater emphasis on sound financial, operational, and cooperative practice in all parts of the cooperative movement.

Definite gains were made in relations with other groups, notably with labor and church organizations, which are becoming aware of the advantages of cooperation and in numerous cases are actively fostering the organization of new associations.

The year was an extremely active one as regards legislation affecting cooperatives. Altogether, 44 legislatures met in regular or special session and many of them considered or passed measures concerning cooperatives or affecting them. In the latter

class were bills introduced or passed in a number of States, reserving solely to the medical profession the right to operate medical or hospital plans on a prepayment basis. Such laws would of course have the effect of preventing any further expansion of cooperative plans in these States, in this field. The attacks by private business, against the alleged evasion of taxes by cooperatives, and the hearings by a Congressional Committee which went into the matter of taxation touched off legislative maneuvers in a number of State legislatures and resulted in several resolutions directing a study of the tax status of cooperatives in the States. Reports will be made to the next session of the legislatures.

The cooperative movement has found itself increasingly, of late years, on the defensive against attempts to restrict its activities through the medium of legislation, and is generally coming to the conclusion that although it should not identify itself with political parties (remaining neutral in that respect), for its own survival it must concern itself actively with legislative matters.

FLORENCE E. PARKER.

CONTRACT SETTLEMENT. Office of. Contract terminations began early in the war production program, and the need to settle terminated war contracts soon became apparent. At first the contracting agencies of the Government, principally the War and Navy Departments, the Maritime Commission, the Treasury Department, and the Reconstruction Finance Corporation and its subsidiaries, developed their own procedures. However, the need for uniform methods soon made itself felt, and the Joint Contract Termination Board, under the Office of War Mobilization, was established by the principal contracting agencies. The basis of unified action to settle terminated contracts was elab-

orated in the *Report on War and Post-War Adjustment Policies* published by Bernard M. Baruch and John M. Hancock, who had been appointed as the Advisory Unit for War and Post-War Adjustment Policies of the Office of War Mobilization. This Report stressed the need for speed in the settlement of war contracts and for fairness to the contractor and to the Government. Subsequently action by various Congressional Committees led to the passage of the Contract Settlement Act.

The Contract Settlement Act of 1944, Public Law 395, 78th Congress, which became effective on July 21, 1944, established the Office of Contract Settlement as the policy-making agency to prescribe policies, principles, methods, procedures, and standards for the contracting agencies. Subject to the supervision of the Office of Contract Settlement, the contracting agencies are responsible for carrying out the Act's objectives. Except for appeals, all contract settlement operations are carried out by the contracting agencies.

Robert H. Hinckley, a Vice-President of the Sperry Corporation, New York, and former Assistant Secretary of Commerce for Air, was appointed Director of Contract Settlement and assumed his duties on July 28, 1944.

As a first step, the Director provided for the continuance of the work which the Joint Contract Termination Board had under way. As a second step, he established an organization to perform the duties prescribed by the Act. This organization reflected the direction of the Act to utilize "the personnel and facilities of the contracting agencies and other established Government agencies" to the maximum extent feasible.

In addition to the Contract Settlement Advisory Board and Appeal Board, the Office was organized in nine major units as follows: Terminations, plant

clearance, interim financing, training, progress and statistics, public information, accounting, organization and procedures, and general counsel. To provide for effective cooperation with the contracting agencies, a system of advisory committees of the Contract Settlement Advisory Board was set up. These standing committees parallel organizational units of the Office of Contract Settlement. Each committee is established by the Director, who names a chairman from his own staff and asks each agency on the Advisory Board to designate a member. In some cases agencies not on the Advisory Board are asked to designate representatives when they can contribute special knowledge. Commit-

increase in volume during the last quarter of 1945. In only a small percentage of cases did government agencies require more than 60 days to clear plants. Representatives of industry have expressed their satisfaction with the way in which the Government has handled contract settlement matters.

By the end of 1945, the contracting agencies had settled a substantial percentage of the number of terminated contracts. Work on a considerable portion of the remaining terminations was well underway. On Jan. 31, 1946, Robert H. Hinckley retired as Director of Contract Settlement. The President sent to the Senate the nomination of H.

tees may also be established for particular problems.

While there are 28 contracting agencies which may have war contracts subject to the Contract Settlement Act of 1944, the major burden of terminating and settling war contracts falls upon five of them: War and Navy Departments, the Maritime Commission, the Treasury, and the Reconstruction Finance Corporation and its subsidiaries. Subject to this supervision, the contracting agencies are likewise responsible for carrying out the Act's objectives.

Progress in 1945. The Office of Contract Settlement has issued 20 regulations dealing with such matters as interim financing, plant clearance, pretermination agreements, standard settlement proposal forms, retention of records, accounting practices and other subjects. The issuance of these regulations as provided for by the legislation has facilitated the prompt settlement of terminated war contracts.

The Appeal Board of the Office of Contract Settlement was established, and Regulation 15 was issued, embodying rules of practice and procedure. Robert S. Stevens, Dean of Cornell University Law school, on leave, was appointed Chairman of the Appeal Board. Up to Dec. 1, 1945, 31 cases had been filed with the Board. Decisions have been handed down in 13 and 6 have been withdrawn. Edward J. Dimock of New York succeeded Dean Stevens on Oct. 1, 1945, as Chairman.

The reconversion of industry from war to peace has not been hampered either by lack of adequate financing on terminated contracts or by failure of the Government to clear contractors' plants of unwanted materials. The partial payment and guaranteed loan (T-Loan) program has proved more than adequate to finance industry in transition. In addition, business could also avail itself of some types of production loans which could be shifted to finance terminations. Plant clearance both of termination inventories and of government-owned equipment proceeded smoothly in spite of a great

Chapman Rose, Deputy Director, to be his successor.

The appended table gives the status of contract settlement as of Dec. 31, 1945.

H. CHAPMAN ROSE.

COPPER. Ending of heavy war needs for copper found the world as a whole with mines developed to produce far more copper than apparently would be needed in peacetime. The United States, however, faced declining production that might force it, within a decade, to import a portion of its normal needs.

Mine production of copper in the United States in 1945 was 774,562 net tons (1944, 837,089 net tons; 1943, 938,727 net tons). Shortage of manpower, aggravated by withdrawals by the armed services, proved the greatest difficulty in maintaining output. As in previous years, Arizona, with a number of both open pit and underground mines, led in production. Utah, nearly all of whose production came from the mammoth open pit mine of Utah Copper Co. in Bingham Canyon, was second, and Montana, producing 95 per cent of her tonnage from the Anaconda Copper Co. properties at Butte, was third. Nevada, New Mexico, and Michigan produced important tonnages, although three Michigan mines halted production in the fall when special prices were cancelled.

Copper refineries in 1945 produced about 1,100,500 tons of metal from both foreign and domestic ores (1944, 1,221,187; 1943, 1,379,263). With the end of the war imports of foreign ore dropped off rapidly, contributing, along with manpower shortages throughout the year, to the lower production figure.

Imports of refined copper were about 530,000 tons during the year, establishing a new high. Chile supplied about 75 per cent, with substantial amounts from Canada, Belgian Congo, and Rhodesia. About 330,000 tons additional were imported in the form of concentrates and blister copper, principally from these countries and Mexico.

Consumption shadowed Allied military fortunes closely. In the early part of 1945, the brass mill industry (brass is about 70 per cent copper) groaned to fill needs of a sharply increased ammunition program following military reverses in Belgium late in 1944. In March, brass mill production hit an all-time monthly peak of 517,539,000 lb. compared to a prewar average of about 100,000,000 lb. As the European war drew to a close, the output dropped rapidly, and in August 175,725,000 lb. was being produced. With the Japanese surrender, production levelled off at about 150,000,000 lb., with prospect of continued production at this level to meet reconversion demands. Total consumption of new copper for 1945 was 1,471,700 tons, according to the Civilian Production Administration.

The drop in military requirements was so sharp after the end of the European war that the War Production Board almost immediately revoked most restrictions on the use of copper, which had been tightened in March. Before the end of May, most delivery controls on brass mill products were revoked. The master copper control order, M-9, was withdrawn August 21.

Future difficulties of domestic mines in meeting peacetime needs were foreshadowed by the fact that their 1945 production was about half the amount of new consumed in the United States in each of the war years and barely enough to meet consuming demands in most years of the late 'thirties. Under the government's premium price plan the mines continued to be paid a premium for mining ores which it would be unprofitable to mine at the ceiling price of 12 cents per lb. Thus, for 1945, the average price paid for copper mined in the United States was 13.6 cents per lb. The premium price plan is scheduled to end June 30, 1946. Elmer W. Pehrson, chief, economics and statistics branch, United States Bureau of Mines, places United States commercial copper reserves at 34 years on the basis of the 1935-39 annual rate of use.

During the war, copper mining activity all over the world was greatly increased, and most foreign producers now are faced with a heavy surplus. Reconstruction Finance Corp., buying for the U.S. Government, re-established its foreign purchase program, which had been discontinued in October, 1945, on Jan. 30, 1946. The agency will buy 120,000 tons during the first six months of 1946, probably most of it from Chile. The British Empire, whose prewar copper resources roughly balanced its requirements, now finds itself over-supplied with heavy Rhodesian production plus a probable 150,000 tons a year from Canada. More than half of Canada's output is a by-product of the Sudbury, Ont., nickel mines, the world's largest. The Belgian Congo is able to mine sufficient copper to supply the European market almost single-handed.

Stocks of refined copper held by the government through the Reconstruction Finance Corp., totalled 493,998 tons on Nov. 30, dropping about 4,408 tons from the preceding month due to releases to industry. Much of this metal will be placed in a permanent defense stockpile if pending legislation is passed.

CHARLES T. POST.

COPYRIGHT. Registrations for the fiscal year 1944-1945, according to the report of the U.S. Register of Copyrights, numbered 178,848, as compared with 169,269 for the preceding year. Of these 40,544 were classed as books, but included pam-

phlets, leaflets, and contributions in periodicals. Those printed in the United States numbered 39,754, those printed abroad in a foreign language, 111, while the remainder, 679, were English books registered for ad interim copyright. The chief classes of the remaining registration were: Periodicals (numbers) 45,763; musical compositions, 57,835; dramatic or dramatico-musical compositions, 4,194; works of art, models, or designs, 1,821; drawings or plastic works of a scientific or technical character, 1,554; photographs, 1,258; prints and pictorial illustrations, 2,634; maps, 857; lectures, sermons, addresses, 1,177; motion-pictures not photoplays, 1,120; motion-picture photoplays, 615; reproductions of works of art, 186; commercial prints and labels, 7,403. The renewals numbered 11,367 as compared with 10,203 in the preceding year. The fees applied during the year amounted to \$338,812. The total number of separate articles deposited during the fiscal year ended June 30, 1945, was 272,092. The gross receipts of the Register's office for the fiscal year were \$367,312.04, the total expenditures for salaries, \$316,870, and for supplies, \$1,423.

CORSICA. A French island department in the western Mediterranean, 100 miles southeast of Nice. Area, 3,367 square miles. Population (1936), 322,854. Chief towns: Ajaccio (capital) 38,000 inhabitants; Bastia, 52,208.

COSTA RICA. A republic of Central America. Area: 19,238 square miles. Population: 725,149 (official estimate, December 1944). Capital: San José.

Costa Rica has low tropical coastal plains and a mountainous interior. The Meseta Central, a highland plateau of 3,000 to 4,000 feet elevation, enjoys a temperate climate and is the center of the country's population and industry.

Government. Under the Constitution of 1871, Costa Rica is a centralized republic of 7 Provinces. It has a unicameral legislature of 45 members, elected for 4-year terms, one-half being elected every two years. The President is elected for a 4-year term, and is assisted by a Cabinet of 9 ministers. President Teodoro Picado Michalski was elected on Feb. 13, 1944, and assumed office on May 8, 1944.

The People. According to the census of 1927, about 80 percent of the people of Costa Rica are of almost pure Spanish descent; 14 percent mestizo; 4 percent Negro, and 2 percent Indian. Seventy-five percent live in the Meseta Central. The largest cities are: San José, 75,000; Heredia, 10,000; and Alejuela, 10,000.

Spanish is the official language, but English is taught in schools throughout the country and is spoken widely in the eastern lowlands. Roman Catholicism is the state religion.

It is estimated that 82 percent of the total population is literate. In 1941 there were 761 primary schools with a total enrollment of 73,217; 49 secondary schools with a total of 7,251 students; and the National University of Costa Rica had a student body of 820. Primary education is compulsory. Under the school law of 1945, matriculation and tuition in the Government's secondary schools is to be free to all students whose parents or guardians own no other property than the house in which they live.

National Economy. Agriculture and agricultural processing are the leading occupations of Costa Rica. Coffee, bananas, and cacao are the most important crops. There are also small lumber and pastoral industries. Total production of green coffee

beans during the 1943-44 crop year amounted to 370,575 bags of 60 kilograms. Normally Costa Rica produces between 100,000 and 120,000 bags (150 pounds net) of cacao annually, and exports about 80 percent. Banana cultivation is one of the main industries of the country; practically all of this crop is exported to the U. S.

Manufacturing in Costa Rica includes plants for coffee-cleaning and for grinding coffee and cacao, rice mills, sawmills, sugar mills, shoe factories, extraction of edible oil, cotton textiles, and handicraft.

Foreign Trade. In proportion to its population Costa Rica has a larger foreign trade than any other Central American country except Panama. In 1944 exports totalled \$10,528,374. Exports of coffee during the 1943-44 quota year totaled 308,747 bags, valued at \$6,296,579. Banana exports in 1944 totaled 1,879,000 stems, valued at \$1,774,754. Coffee exports accounted for about 60 percent and banana exports for about 17 percent of the total exports. Because of severe storms, Costa Rica's export of cacao in 1944 fell to 9,220,795 pounds, valued at \$836,564, as compared with 12,224,842 pounds, valued at \$1,110,306 in 1943. More than half of the cacao exports in 1944 went to Colombia, with Mexico ranking second as a market. The U. S. took about 9 percent. Costa Rica exported gold bars in 1944 valued at \$96,956, and gold ore concentrates valued at \$21,242. Other exports were: fruit, vegetables, honey, hides, and skins.

In 1942 Costa Rica's imports totaled \$12,287,000, consisting chiefly of manufactured products and foodstuffs. The U. S. supplied 73 percent; Mexico 7 percent; and 3 percent from Argentina, the United Kingdom, and Panama.

Events, 1945. The year opened tumultuously in Costa Rica. On the last night of the old year, three persons had been wounded when an armed group of alleged followers of former President León Cortés Castro fired on the home of President Teodoro Picado, and an armed assault on the home of Manuel Mora, head of the Popular Vanguard (formerly Communist) Party, resulted in the beating of his mother and sister. Police also reported several oppositionist demonstrations in San José.

Many paraders were injured in a clash with police during a New Year's Day demonstration for Cortés; and the President charged that the attack on his home had been provoked by Cortesistas, whose probable plan to overthrow the Government had been frustrated. One person was killed and several wounded in clashes between oppositionists and supporters of the Government on New Year's night. Cortés denied that he or members of his party were plotting a revolt, and rejected any responsibility for the attack on the President's home. His party, he said, was maintaining "peaceful opposition against the Government."

The opposition charged that the trouble had started when "Communist shock brigades" attacked followers of Cortés Castro, while the Communists replied that workers had only "answered the aggression of Cortesistas."

A few days later a break between the Government and the Popular Vanguard Party was threatened, when War Minister Rene Picado, brother of the President and reportedly opposed to the pact with the leftists, discharged 50 alleged Communist policemen because of their part in the New Year's disturbances. The crisis was eased when the President and his entire Cabinet reaffirmed their loyalty to the pact between their supporters and the Popular Vanguard.

The War Minister resigned on Jan. 15, and the President himself took over the office. The President

refused to accept the resignation of Agriculture Minister José Joaquín Peralta. The Foreign Minister denied that the Mexican Ambassador had intervened in the crisis, as some of the press charged.

Congress approved a resolution on Mar. 22 requesting suspension of relations with Spain, and Congressional president José Albertazzi Avendano declared that body would do its utmost to force a rupture with Franco. *Diario de Costa Rica* charged on Apr. 4 that provocation of such a rupture was behind a "serious incident" which had occurred when police entered the property of the Spanish legation to obtain the personal belongings of expelled German nationals whose property had been in Spanish custody for two years. Later that month President Picado sent a message of congratulation to anti-Franco Spaniards on the fourteenth anniversary of the Spanish republic. But on Sept. 12 the Foreign Minister asserted that Costa Rica would not break relations with Spain; it would follow the lead of the United States, the United Kingdom, and the Soviet Union.

On Apr. 24 the Government of Panama declared Costa Rican Ambassador Enrique Fonseca Zuñiga *persona non grata* because he gave asylum to refugee Panamanian Deputy Simón Vega. Fonseca Zuñiga said that everything he had done was with the knowledge and consent of his Government.

Officials announced on Apr. 29 that Cocos Island had been leased to the U. S. Inter-American Affairs Food Production Division for land cultivation and cattle raising.

Former President Cortés Castro returned to the political scene on June 11 when he said that he was unwilling to participate in 1946 congressional elections, and that he would not be a presidential candidate in 1948 because he had "no confidence in free election promises given by the Picado regime."

On June 19 a threatened break between Picado and organized labor was averted when the President promised to avoid delays in payment of government workers and to give special care to the needs of laborers.

The following day the U. S. State Department announced that President Truman had accepted "with great appreciation" a gift of land from the Costa Rican Government for construction of a U. S. embassy.

The left-right conflict broke out again early in August when the opposition press attacked Mexican Ambassador Roberto Córdova, charging that he had intervened in internal politics of Costa Rica. A group of leftists serenaded the ambassador to show their disapproval of the attacks.

The Government was notified that on Sept. 24 United States forces would be withdrawn from a base near San José and that forces and materials would be removed to the Canal Zone.

A proposal to reestablish a public instead of secret ballot was defeated in Congress by 23 votes to 22 on Oct. 3.

The Government on Dec. 27 seized the Northern Railway Company, whose operations between Puerto Limón and San José had been paralyzed by a strike since Dec. 22. The strike, for wage increases, was declared illegal, after workers rejected a compromise solution proposed by Labor Minister Miguel Brenes Gutiérrez.

HARRY B. MURKLAND.

COURT GAMES. Indoor court games enjoyed a slight revival in 1945. Matches for the Lapham Trophy, held annually between American and Canadian teams since 1922, again featured the squash racquets season and the U. S. retained honors in

the event. A new international competition made its debut when Alastair Grant of Montreal presented a trophy for an annual doubles meeting between American and Canadian teams. Laurels in this first tournament also went to U.S. players.

An old court tennis fixture, the Payne Whitney Memorial tourney, was held for the first time since 1940 and the team play was won by Long Island, which triumphed over New York and Boston. Lt. Comdr. Ogden Phipps, Jock Whitney, J. Nelson Pell and James Knott won for Long Island in the final round. Only other court tennis play of note was the Red Cross benefit tournament in which Pierre Etchebaster, world open champion, paired with Lt. Comdr. Robert Gerry, Jr. to defeat Phipps and Lt. Comdr. Robert Grant 3d.

Squash tennis was confined largely to club tourneys and a few benefit matches. H. J. Rose of the Princeton Club kept the national veterans' championship and F. R. Hanson of the Columbia Club captured the National Association's Fall scratch competition. Stanley Pearson, Jr. of the Philadelphia Cricket Club was victor in the annual invitation play at Montreal.

THOMAS V. HANEY.

CRANBROOK FOUNDATION. A foundation in Bloomfield Hills, Mich., established in 1927 for the purpose of adding to and strengthening educational and cultural facilities within the State of Michigan. It is developing a cultural center at Bloomfield Hills in which are included Brookside School Cranbrook, a day school for children from kindergarten through the sixth grade, Cranbrook School and Kingswood School Cranbrook, boarding and day preparatory schools for boys and girls respectively, Cranbrook Academy of Art, Cranbrook Institute of Science and Christ Church Cranbrook. Expenditures for the year ended June 30, 1945, were \$195,144.95; capital assets on that date, \$6,486,020.04. Chairman of the Board of Trustees: George G. Booth.

CRETE. A mountainous island in the eastern Mediterranean, forming the most southerly part of Greece. Crete was occupied by German armed forces during May, 1941, and was recaptured by Allied armed forces in 1945. It is 160 miles long and from 6 to 35 miles wide. Area, 3,235 square miles. Population, 441,687 on Jan. 1, 1939. Chief towns: Canea, the capital, 26,604 inhabitants; Candia, 33,404; Rethymnon, 8,632. There are good harbors along the northern shore, particularly at Suda Bay, but the south shore has no satisfactory ports.

CROSS-COUNTRY RUNNING. Charles Robbins, Jr., Navy Pharmacist Mate from Brunswick, Me., again was the most consistent scorer in A.A.U. distance events. The New England champion captured national titles at 20, 25 and 30 kilometers, repeated his victory of 1944 in the U. S. Marathon, and placed second in the cross-country test, which was won by Tom Quinn, New York A.C.

In pacing the N.Y.A.C. to team honors in the hill-and-dale grind at Buffalo, Quinn toured a treacherous snow and ice-covered course in 34:14 to set a new record for the Delaware Park layout of 10,000 meters. Only the week before, Quinn had carried off the metropolitan senior A.A.U. senior crown in leading his Winged Foot mates to the team championship for that event.

The traditional Boston Marathon was won by Johnny Kelly of Acton, Mass., who also captured the New England honors at 25 kilometers.

John T. Hanley of Dartmouth won titles in the I.C.A.A.A. and Heptagonal harrier tests, with the team laurels in both going to Army. Fred Feiler and his Drake University mates successfully defended their titles in the National Collegiate run. Victor Twomey of Illinois and the Wisconsin University team scored triumphs in the Western Conference championships, while New York University and its ace Alex Jordan won in the Metropolitan intercollegiate run.

THOMAS V. HANEY.

CUBA. An island republic of the West Indies. Area: 44,217 square miles. Population: 4,778,583 (1943) Capital: Havana.

About one-fourth of the island is mountainous; the remainder is composed of lowlands, terraces, and gentle slopes. There are no extremes of temperature and little variation between summer and winter. The rainy season is from May to November.

Government. Cuba, under the Constitution of 1940, is a centralized republic of 6 provinces. It has a bi-cameral Congress: a Senate of 54 members, and a House of Representatives of 114. The Congress convenes twice a year, in March and September, for not less than 60 days. The president is elected for a 4-year term and is aided by a Cabinet of 17 ministers, 4 without portfolio. Dr. Ramón Grau San Martín was elected President on June 1, 1944.

The People. Sixty-five per cent of Cuba's population belong to the white race; Negroes, mestizos, and other races compose the remainder. Density of population ranges from 48 persons per square mile in the Province of Camaguey to 389 in the Province of La Habana. The largest cities are: Havana, 676,376; Marianao, 114,743; and Santiago de Cuba, 120,577.

Spanish is the official language of Cuba. The predominant religion is Roman Catholic.

It is estimated that from 60 to 70 per cent of the population over 10 years of age is literate. In 1941 there were 5,982 primary schools teaching a total of 537,756 children; 168 secondary schools had a total enrollment of 27,423 in 1938-39. The University of Havana had 13,940 students in 1941.

National Economy. Cuban economy is dependent on sugar and tobacco. More than half of the persons gainfully employed are engaged in agriculture, and of these, 70 per cent work in the sugar industry. The 1944 sugar crop amounted to 5,646,337 short tons; most of it was exported to the United States, including about 16 per cent in the form of invert molasses. Tobacco is Cuba's second crop in export importance. The 1944 crop of 65,700,000 pounds was the largest since 1931, and over 50 per cent larger than the 1943 crop. Other important Cuban crops include corn, grown chiefly for domestic consumption; pineapples, bananas, and henequen, which are exported.

Cuba's most important manufacture is the production of sugar from cane. Tobacco manufactures are also important, and other products include: rope and cordage, shoes, cement, paint, and agricultural tools and implements.

Foreign Trade. Cuba's foreign trade totaled \$635,707,000 in 1944, over 20 per cent more than the total for 1943. Exports were valued at \$427,058,296, an increase of 21.8 per cent over 1943. Of total exports in 1944, the United States took 88.9 per cent, valued at \$379,974,712, an increase of about 28.5 per cent compared with the value in 1943. Cuban exports to Europe were valued at \$34,858,192, 6 per cent less than in 1943. Exports of sugar and other cane products in 1944 were valued at

\$296,750,000. The value of tobacco exports reached an all-time high of \$51,700,000 in 1944.

Cuban imports in 1944 reached a total value of \$208,648,000, the highest since 1929, exceeding the 1943 figure by 17.6 per cent. Of the total, the United States supplied 80.9 per cent, valued at \$168,840,864, an increase of 21.9 per cent over 1943. Imports from Europe were valued at \$6,027,430; imports from Asia, \$5,658,967. Cuba's chief imports are: foodstuffs, textiles, manufactured products, machinery and other equipment.

Events. The opening of the year found Cuban politics disturbed. Members of President Ramón Grau San Martín's own Auténtico Party and supporting groups were openly dissatisfied with the distribution of patronage and with Grau's alleged failure to appoint technically qualified Ministers. Further disorganization was caused by mass dismissals of government employees and by the inability of the Government to deal with shortages of such basic food items as milk, eggs, bread and butter.

The President did win an advantage on February 25, however, when the Popular Socialist (formerly Communist) party agreed to support his policies. This gave his Government a majority in the evenly divided Senate. The party later defined its position as not part of the Government but not part of the opposition either.

Eugenio Llanillo García, personal lawyer and friend of former President Batista, was kidnapped and shot to death on the night of March 14. During the following night and the early morning of March 16, army and police forces suppressed an attempted armed rebellion against the Grau Administration by arresting about 80 former army and police officers and civilians who had been connected with the Batista Administration. They were said to be led by former army chief José Eleuterio Pedraza. No shots were fired and Havana remained calm as the roundup was made. The plot was believed to have its origin in the dismissal of about 1,500 army, police and civilian officials of the Batista regime by Grau after he took office. Grau blamed the attempt on "capitalists" who had had business dealings with the Batista Administration, implied that members of Congress were also implicated, and said: "I have no positive proof of his (Batista's) participation, but neither do I have any that he is not involved." Opposition leaders and Batista, in San Francisco, denied the charges.

President Grau asked immediate reform of the tax system, establishment of a national bank of issue, and approval of other laws to put the 1940 constitution into effect, as the second legislative period of the 20th Congress opened on March 19.

The trial of Pedraza and 40 other alleged participants in the plot against the Government opened on March 27. A number of the defendants were released for lack of evidence. Pedraza and five others were convicted and were sentenced to one year's imprisonment. Enrique Enriquez, Chief of Government Palace Secret Service and a prominent government witness in the trial, was machine-gunned to death from a speeding auto on April 24.

But for most Cubans, the trial was overshadowed by the severe food and other shortages which gripped the country. Riots broke out in Havana as crowds stormed grocery stores where soap was on sale for the first time in many days. Milk and butter were not to be found. Lard, oil, beans, rice and eggs grew scarce. Prices of domestic vegetables rose steadily.

A dispute broke out between Cuba and Ecuador

on April 11 over a deal completed in January whereby Cuba agreed to purchase 15,000,000 pounds of Ecuadorian rice at \$8 per hundred pounds, and to sell Ecuador 25,000,000 pounds of sugar at \$3.25 per hundred pounds. On April 11 Cuban Commerce Minister Alberto Inocente Álvarez charged in Senate hearings that the Ecuadorian Government was speculating in rice and was not fulfilling the contract. Ecuador denied the charge. The incident ended on April 23 when the Ecuadorian Minister to Cuba announced that Cuba would receive 10,000,000 more pounds of rice.

Three days later long-drawn-out negotiations ended in the signing of three contracts between the Cuban Government and the United States Commodity Credit Corporation, providing for sale of most of Cuba's 1944-45 sugar crop to the United States for 3.10 cents per pound f. o. b. Cuban ports. The price was less than the Cubans wanted but more than the 3 cents offered originally. Molasses and industrial alcohol were also covered in the contracts. The 1945 grinding season closed on June 13 with output 30 percent below that of 1944.

The island's meat supply was practically exhausted by June 5, according to local radios. The Government put into effect a new direct producer-to-consumer distribution program. Riots broke out when angry consumers clashed with a parade of butchers who were protesting the new regulations; one person was killed, several injured, and eight arrested.

A diplomatic incident with Spain developed on July 28 when a Spanish ship carrying the new Minister to the United States, Manuel Aznar, docked in Havana. The envoy did not leave the vessel, reportedly on the advice of the Cuban Government, and police dispersed a crowd at the waterfront which distributed handbills accusing him of spreading fascist propaganda. But some 1,000 students carrying banners inscribed "Death to Franco," stoned the Spanish Embassy, ripped down the Spanish flag, and damaged property. The Spanish Government made a formal protest.

A barter agreement to exchange 1,500 tons of Cuban sugar for 800 tons of Uruguayan jerked beef was signed on September 14.

President Grau began his second year in office on October 10 with a major Cabinet crisis on his hands. Foreign Minister Gustavo Cuervo Rubio and Commerce Minister Alberto Inocente Álvarez, both Republicans, had presented their resignations. Álvarez was charged with mishandling barter of Cuban sugar for Argentine, Ecuadorian, Mexican and Uruguayan products. Prime Minister Félix Lancia also quit. On October 13, Grau appointed Senator Carlos Prio Socarras, a youthful leader of his own Auténtico Party, as Prime Minister, elevated Under Secretary of Commerce Cesar Casa to the minister's job, and named Álvarez Foreign Minister. The latter appointment was called a slap in the face of the opposition-controlled House of Representatives, whose vote of no confidence had forced Álvarez out of the Commerce Ministry.

With leaders of all six political parties favoring the move, the Senate on October 15 unanimously approved a motion recommending the rupture of diplomatic relations with Spain and recognition of the Spanish republican Government-in-exile. The House of Representatives concurred unanimously on the following day.

Negotiations for sale of the 1945-1946 sugar crop opened in Washington on October 17. The

United States offered the highest price since the war started: 3.675 cents, as compared with 3.10 cents paid for the last two crops. The Cubans, however, fearful of postwar competition from other areas, wanted a three to five year contract, while the United States negotiators insisted they had no legal right to deal for more than one crop. The talks were deadlocked for the rest of the year.

Col. Antonio Brito, former Chief of National Police, was assassinated in a Havana suburb on November 28 by an unknown assailant who fired from a passing automobile.

The year ended as it had begun, on a note of confusion and crisis for the hard-pressed Government of President Grau. On December 10, officials announced the arrest of Eugenio Menéndez, aide to former President Batista and a lieutenant in the National Police force, and three of his employes, after the discovery of a cache of arms and equipment on Menéndez's ranch, 70 miles west of Havana.

On the same day, heavily armed police threw a cordon around the Ministry of Education, after they had failed to evict 30 high school students who had barricaded themselves in the building because, they said, Education Minister Diego Vicente Tejera had denied them audience when they tried to see him to protest against "inefficiency" and unqualified instructors.

And on December 11 the President accepted the resignation of Senate President Eduardo Suarez Rivas and his assistant, who had been under fire from the united opposition Senators of the Liberal, Republican and ABC Parties. Suárez Rivas and his vice president were replaced by an Auténtico and a Communist, respectively. These were the only two parties now supporting Grau. Communist support of the Administration gave it an acting majority in the Senate, although the opposition still controlled the House of Representatives.

HARRY B. MURKLAND.

CUSTOMS, Bureau of. Customs activities continued, during the sixth year of the war, to be determined as much by the exigencies of the prolonged conflict as by consumptive and commercial considerations. Not only did all the special responsibilities delegated to customs officers as a part of the national defense program continue in effect, but the very nature of the regular customs functions was colored and limited by war aims and war operations. The kind of goods imported, the sources from which they were secured, and the vessels and vehicles in which they were transported all yielded to the pressure of war needs.

Customs Collections. From a high of \$727,251,316 in 1944, total collections by customs officers receded to \$561,101,058 in 1945. Of these amounts, \$434,259,038 in the earlier and \$358,138,757 in the latter year consisted of actual customs collections, while \$292,992,278 and \$202,962,301, in these respective years, was collected for other agencies, chiefly as internal-revenue taxes on imported liquors and wines.

Customs collections, during July and August, 1944, continued the downward trend which prevailed during the last three months of the preceding fiscal year, shrinking from \$42,998,953 in March to \$23,407,658 five months later. During the remainder of the year, however, collections increased steadily and almost continuously to \$36,126,921 in May, the only interruption in the upward trend being in the short month of February.

Wool and wool manufactures have been the chief source of customs revenue during each of the past five years, duties on such imports representing 30.8 percent of the total duties in 1944, and 35.1 percent in 1945, despite a decline during the latter year. Duties on imports of spirits, wines, and other beverages ranked second in importance in both years, amounting to \$99,712,606 in 1944 and \$55,316,286 in 1945. Customs revenue from this source in 1944 reached the highest point in customs history due to the diversion of domestic alcohol from the manufacture of liquor to war purposes which caused imports to rise to an unprecedented level. Even with reduction in liquor imports in 1945, which caused a 44.5 percent decrease in duties on alcoholic beverages, collections from this source were higher than in any year before 1944. Duties on sugar, which prior to the past year, were among the important sources of customs revenue, yielded a comparatively small amount of duties in 1945, due to the admission, duty free under the terms of Executive Order 9177, of most of the sugar brought from Cuba and other countries. The decline in revenue from the commodities included in these three tariff schedules more than accounted for the entire decrease in customs receipts in 1945.

Dislocations in trade resulting from the war continued to be manifested in the territorial sources of customs revenue. Duties on European goods amounted to only 17.4 percent of the total duties collected in 1945, compared with 47.6 percent in 1939, the last year before the war. Furthermore, 98.1 percent of the European total was collected on duties from Switzerland, Portugal, Spain, and the United Kingdom, which in 1939 were responsible for only 35.9 percent of the European total. Duties on Asiatic imports, although slightly larger than in 1944, were also much smaller than in the previous years. Duties on goods from Cuba also fell to a new low with the admission of a great deal of sugar duty free, and with reduced imports of alcoholic beverages. Duties on Canadian imports, on the other hand, were the largest recorded in recent years and those on goods from South America were exceeded only in 1942. Duties on imports from Oceania and Africa, while slightly less than in the war years immediately preceding 1945, remained at levels far above those reached prior to the war.

Volume of Business. Entries of merchandise were slightly more numerous and border traffic much heavier than during the previous year, indicative of a trend toward more normal conditions in trade and commerce. The moderating of wartime restrictions on tourist travel accounted both for large increases in the number of baggage and informal entries and for the greatly increased number of persons entering the United States by vessel and vehicle. Airplane travel on international lines showed particularly heavy gains, the number of aircraft arriving in the United States being almost double and the number of passengers arriving by air more than double that of the previous year.

Law Enforcement. As a part of the enforcement of customs laws a considerably larger number of seizures were made than during any year since the repeal of the 18th amendment. This increase was due in part to increased tourist traffic, in part to military and naval personnel returning from overseas, and in part to a shortage of certain materials, such as cigarettes, in this country. The value of guns and ammunition seized during 1945 was more than 12 times that of 1944 and the value of tobacco products seized almost sixfold greater. Liquor seizures, on the other hand, declined sharply, both

in number and in value, as domestically produced spirits became easier to obtain. Narcotic seizures by customs officers along the border were of minor consequence in both years.

W. R. JOHNSON.

CZECHOSLOVAKIA. A republic in central Europe which was under German control from March, 1939, until its liberation by Allied armed forces in 1945 (see EVENTS below). Area: 49,373 square miles (excluding Ruthenia ceded by treaty to the U.S.S.R. in 1945). Population (1930 census): 14,000,000 (excluding those in Ruthenia). Capital: Praha (Prague), 962,200 inhabitants (1937). Other important cities: Brno (Brünn), 291,800 (1937); Moravská Ostrava, 178,099 (1935); Bratislava (Pressburg), 170,668; Plzeň (Pilsen), 124,353 (1935). See YEAR BOOK for 1939 for prewar statistics relating to Czechoslovakia. Statistics relating to Czechoslovakia during the war years may be found in the League of Nations *Monthly Bulletin of Statistics*, October, 1945 (Geneva Edition) and *Statistical Year-Book of the League of Nations*, 1942/44.

Events, 1945. To the ancient lands of the West-ernmost Slavs was reserved the doleful honor in 1945 of being the last of the territories overrun by the Hitlerite hordes to be delivered from Nazi oppression. Here the broken Wehrmacht made its final stand and suffered its ultimate defeat. Here, under the aegis of Soviet Muscovy and the guidance of the returned government-in-exile, Czechs and Slovaks belatedly undertook the tasks of reconstruction within a Republic reduced in size by the loss of Ruthenia but enhanced in inner unity by the stern expulsion of Teutonic and Magyar minorities. By year's end the new Czechoslovakia had emerged from its seven years' nightmare of enslavement and made a brave beginning toward a new era of freedom and peace.

Homeward Via Moscow. Early in the year the government-in-exile continued in London the preparations initiated in 1944 for returning to the homeland in the wake of the Red Army. Following the example of the USSR, President Benes and his Cabinet granted diplomatic recognition on January 31 to the Polish Provisional Government. Plans were made to proceed to Kosice in Slovakia where a new coalition Cabinet would be named. In his farewell reception to newsmen on February 21, Dr. Benes expressed his resolve that the Sudeten Germans must leave Czechoslovakia. On the 25th Churchill and Eden extended good wishes and *bon voyage* to Benes and Foreign Minister Jan Masaryk.

March found Benes, Masaryk, Prime Minister Jan Sramek and other leaders in the Soviet capital, where they conferred with Stalin, Kalinin, Molotov and representatives of liberated districts and the underground. Decisions were reached for the establishment of a new regime and for the cooperation of Czechoslovak troops against the enemy. On April 6, less than a week before his death, President Roosevelt sent a congratulatory message to Benes:

I know what joy your homecoming must mean both to you and to every other patriotic Czechoslovak because it marks the restoration of your country to the dignity of independence and freedom from foreign oppression. Your homecoming also symbolizes to all Americans the turning of the whole world from the years of conquest and strife to an era of justice and cooperation in a community of free nations dedicated to those same principles of democratic integrity which are so characteristic of Czechoslovakia itself.

The new Provisional Government at Kosice, organized on April 6, at once declared that "in matters of punishing Germany, in settling Ger-

many's reparations obligations, in setting new frontiers and in organizing future peace, Czechoslovakia will stand as near as possible at the side of the Soviet Union and in one row with the other Slav and all democratic countries." The Cabinet was headed by Col. Zdenek Fierlinger, formerly Ambassador in Moscow. Jan Masaryk remained Foreign Minister and represented the Republic at the San Francisco Conference. The Ministry of the Interior went to a Communist leader. The list of Ministers was as follows:

Premier—Col. Zdenek Fierlinger.
Vice Premiers—Josef David, Klement Gottwald, Vilem Siroky, Jan Sramek, Jan Ursiny
Foreign Affairs—Jan Masaryk.
National Defense—Gen. Ludvik Svoboda.
Interior—Vaclav Nosek.
Foreign Trade—Hubert Ripka.
Finance—Vavro Srohar.
Education and Popular Enlightenment—Prof. Zdenek Nejedly.
Justice—Jaroslav Stransky.
Information—Vaclav Kopecky.
Agriculture—Julius Duris.
Industry—Bohumil Lauschnan.
Internal Trade—Ivan Pietr.
Communications—Gen. Antonin Hasal Nizborsky.
Posts—Rev. Frantisek Hala.
Labor and Social Welfare—Josef Soites.
Health—Adolf Prochaska.
Supply—Vaclav Majer.

Victory. While Soviet forces pushed westward through Slovakia, units of the American 3rd Army entered the country near Asch on April 19. But they found no welcome in solidly German Sudetenland, whence many Czechs had been expelled to make room for Nazi fanatics and slave laborers. On May 5, following a May Day strike at the Skoda works in Pilsen, Dr. Hubert Ripka announced in London that the underground had launched its final uprising and seized Prague. Wehrmacht units, already surrendering in droves to Gen. Patton's forces, were still offering fierce resistance to the Soviet armies. As German troops moved to suppress the Prague revolt, Konrad Henlein, Gauleiter of Sudetenland and "Trojan horse" of 1938 (later to die by suicide), added effrontery to criminality by broadcasting an appeal to the United Nations to guarantee continued German possession of the Sudeten areas.

Patton's divisions swept into Pilsen and Karlsbad on May 6, while Red detachments drove toward the capital. Three days later the hard-pressed rebels in Prague were relieved by Marshal Konev's 1st Ukrainian Army while the 2d Army under Marshal Malinovsky fanned out from the Brünn area. The fair city on the Vltava, where Benes and the Cabinet arrived on May 9, was battered by street fighting, bombardment and air-raids. For several days more, after all hostilities had ceased elsewhere on the Continent, Nazi units continued resistance west of Prague. All were soon encircled, however, and compelled to yield, with 700,000 prisoners falling to the Red Army during the last four days of the fighting.

Cession of Carpatho-Ukraine. On June 29 Premier Fierlinger and Foreign Secretary Vladimir Clementis signed with Molotov in Moscow an agreement for the transfer of Carpatho-Ukraine (Sub-Carpathian Ruthenia) to the USSR. Such a cession had been rumored in January and apparently represented the desire of most of the 700,000 Russian-speaking inhabitants of the district which Czechoslovakia had inherited from the Dual Monarchy in 1919 and had lost to Hungary in March, 1939. Ivan Petrushchak, a member of the Czechoslovak National Council who had been sent from London to Carpatho-Ukraine, had presented to Benes late in 1944 a resolution of a Congress held in Uzhorod,

following a plebiscite, which called for the annexation of the territory to the Soviet Ukraine. Petrushchak had originally declared that the Carpatho-Ukrainians wished to remain under Prague, but he changed his mind on the scene and signed the resolution. Various Carpatho-Ukrainian organizations in the United States took an identical view in a memorial presented to Molotov at San Francisco and submitted by him to the British and American delegations.

The final agreement provided for commissions to fix the new boundary. Soviet and Czechoslovak nationals on both sides were permitted to choose their citizenship and to move across the border with their goods and with compensation for immovable property.

Soviet Withdrawal. The loss of the easternmost province to the Soviet Union did not alter the determination of the Czechoslovak leaders to adhere to the policy represented by the alliance treaty of December 12, 1943 (See YEAR BOOK for 1943, pp. 158-9). Gen. Bohumil Bocek, Chief of Staff, announced on May 20 that the new Czechoslovak Army would be equipped by the USSR and would be modeled on the Red Army in its training and organization. But the popularity of the Slavic colossus, here as elsewhere, was not enhanced by the Soviet troops of occupation, who lived off the country and in some instances, as is always inevitable, engaged in depredations and other outrages. Gratitude was widespread toward both American and Soviet forces for substantial aid rendered in relief and reconstruction, but it was tempered by resentment at local abuses and by a general desire to see all foreign soldiers depart as soon as possible.

This aspiration was realized by autumn. Two-thirds of the Soviet troops left the country in July. The Provisional Parliament, meeting in late October for the first time since 1938, unanimously confirmed Benes in the Presidency and endorsed the policies of Fierlinger, who asserted that the USSR was the most reliable guarantor of the Republic's independence. "Alliance with the Soviet Union is the main principle of our foreign policy." By mid-November the last Soviet troops were withdrawn, save for a military mission in Prague and a few thousand guards at specified points. American troops evacuated the western districts at the same time.

Retribution. The restored Republic proceeded promptly against Nazi criminals and their local quislings. In mid-May Marshal Keitel, Walter Funk, Kurt Daluege, Karl Hermann Frank and Albert Speer were included in a Czechoslovak list of Nazi leaders to be prosecuted for their crimes. The 73-year-old Emil Hacha, Nazi puppet-President after Benes' departure in 1938, was arrested by Czech partisans in Prague early in May, but died on June 30 while awaiting trial. Dr. Joseph Plitzner, Deputy Mayor of Prague during the German occupation, was convicted of treason and hanged on September 6.

The Czechoslovak leaders were no less concerned with expelling from the border districts those Germans and Magyars who had played a major role in the Nazi destruction of the State in 1938-39. The prewar policy of tolerance and equality for alien minorities gave way to a program of forcible exclusion which was persisted in despite criticism from Western liberals. Some 500,000 Hungarians and over 2,000,000 *Sudetendeutsch* (out of the total of 3,250,000) were involved. Britain and the United States blocked expulsions in June and persuaded Prague to suspend action during the sum-

mer in accordance with the Potsdam formula that the enforced migration should be effected "in an orderly and humane manner." In the fall the compulsory transfer of Sudeten Germans to the Reich was resumed by installments, with most of the property of the migrants confiscated as reparations. Fierlinger estimated in September that 1,200,000 Sudetens had been expelled or had left voluntarily before the Potsdam Conference, and that the removal of the balance would extend over another year.

In commemoration of the victims of Nazi fury, the Lidice Memorial Committee in the United States announced plans in September for the erection of a \$1,500,000 "open cathedral" on the site of the town destroyed on June 9, 1942. Of the living dead—i.e. political prisoners and forced workers deported to the Reich during the years of darkness—1,100,000 had been repatriated by November.

Toward a New Economy. On October 24 President Benes signed five decrees nationalizing all mines, iron and steel plants, textile and shoe factories, commercial banks and insurance companies. All cooperative enterprises were exempt. Properties of enemy nationals and native collaborators were confiscated. All others, including foreign concerns, were paid for in Government bonds at a valuation based on balance sheets filed for tax purposes. Socialization was approved by all political parties. "In the West," said Benes, "some individuals assert that we are in the hands of the Soviets, yet the Governments look at things differently. . . . I think that on the nationalization question, we shall have no difficulties abroad." On November 5 Masaryk made a plea for Western understanding of the program, pointing out that only through such measures could the people of the Republic put an end to the domination of foreign capital and to the banking chaos left by the Nazis.

Frontiers and Food. Among the many questions unanswered at the close of the year was that of the future status of the Teschen area, seized by Poland in October, 1938, and still claimed by the new Polish Government, which remained in occupation of the district. Rumors of Soviet support for Prague's claim failed to materialize. Masaryk asserted on December 4 that his Government would refuse to carry on further negotiations with Warsaw over Teschen, but was prepared to submit the issue to the UNO or some other tribunal. Meanwhile, no progress was registered toward the Czechoslovak-Polish alliance projected during the war years.

Of more immediate concern to the citizens of the Republic were the problems of economic reconstruction. Foreign trade, upon which the fortunes of Czech industry depend, developed haltingly in the absence of adequate transport facilities, currency stabilization and new commercial agreements. Czech officials and manufacturers sought imports of wool, leather, and cotton (some of which were supplied by the USSR under the trade accord of early summer) and planned to resume exports of glassware and china. Hopes for an American credit of a billion dollars had not been realized at the turn of the year. UNRRA aided the destitute with the assistance of American Relief for Czechoslovakia, Inc. But by December the average diet comprised only 1,600 calories per day (compared to 3,000 in the United States), and 700,000 children were estimated to be suffering from deficiency diseases.

Toward a New State. Politics marked time, pending the resolution of current international and economic issues. Note circulation had increased more

than ten-fold since 1938, but a program of reconversion inaugurated in November promised to put an end to inflation and to provide a stable medium of exchange. The lack of the embittered partisanship characteristic of most other liberated lands furnished new proof, if any were needed, that the democratic way of life was deeply rooted among the Czechoslovak people. Some old leaders passed from the scene—e.g. Kamil Krofta, Foreign Minister in 1936–38, who died on August 18 after spending most of the war years in a Nazi concentration camp. The Provisional Parliament, chosen by the Popular Front of Leftist parties, was to be replaced, according to plans formulated in the autumn, by a new legislature to be elected early in 1946.

President Benes expressed his intention of maintaining a coalition Government of all parties for a period of 5 or 6 years. In Bohemia and Moravia four major political groups were functioning (the Catholic Party, the Socialist Nationals, the Social Democrats and the Communists) and in Slovakia two (the Democrats and the Communists). On November 6 the Cabinet resigned and was at once reconstituted, with the Communists retaining the posts of Interior, Information and Education, and with Dr. Jaroslav Stransky becoming Deputy Premier and being replaced as Minister of Justice by Prokop Drtina, political secretary of the President.

The spirit of the new Republic was well expressed by Benes. "I have no illusions," he observed on August 17. "The Second World War began at Munich. With the capitulation of Japan it is finished. But the world is in ruins. . . . Real peace is the normal condition of life—with no internal revolutionary movements, the establishment of parliamentary life, the reestablishment of industry, and normal, neighborly relations between countries. All the occupied lands were nourished during the war by hope. This life of hope must be continued for several years before general peace will come to Europe." To the British Ambassador Benes declared on October 28: "We are solving our problems in a somewhat radical way. This is demanded by present-day circumstances. But we shall remain steadfast in our adherence to democratic principles, and we shall respect the just interests of our friends at home and abroad. . . . In the near future freely democratic elections will take place, and with these our internal development will be completed and the full state of our postwar democracy will come into being."

See GERMANY, POLAND, U.S.S.R., UNITED NATIONS.

FREDERICK L. SCHUMAN.

DAIRY INDUSTRY, Bureau of. A Bureau of the U. S. Department of Agriculture, established as the Bureau of Dairying in 1924. It conducts investigations in the breeding and management of dairy cattle, in nutrition, and in the physiology of milk secretion and of reproduction. It also records the production of cows in dairy-herd-improvement associations for the purpose of identifying animals possessing an inheritance for transmitting superior milk- and butterfat-producing ability to their progeny. It develops sanitary methods of handling milk on the farm, in transit, and in dairy plants; and studies other factors affecting the wholesomeness and commercial value of milk. Chief: O. E. Reed. See AGRICULTURE.

DAMS. With the ever-increasing number and wider distribution of projects involving reservoirs for

domestic and industrial water supply, irrigation, power development, and flood control, the design and construction of dams is correspondingly increasing and important. Many such projects in various stages of progress, were halted by war conditions and are now being resumed; but progress is slow on account of the shortage of engineers and labor. A majority of the dams are for two or more of the purposes noted above and are under the single or combined control of the Corps of Engineers, U. S. Army (War Department) or the U. S. Bureau of Reclamation, the former having jurisdiction over all flood control and navigation projects and the latter over irrigation projects.

Increasing the height of dams for increased reservoir capacity involves many difficulties in design and construction. A notable example is the past and prospective raising of great Aswan Dam on the Nile (noted below). Still bolder is the raising of the concrete-arch Ross Dam on the Skagit River, serving the municipal hydro-electric plant at Seattle, Wash. Its original height (1940) was 290 ft. It is now being raised 185 ft. (475 ft. in 1946); preliminary work is in progress for an additional 100 ft. (575 ft.); and a further 100 ft. is projected for an ultimate height of 675 ft.

At Tacoma, Wash., the second dam and municipal power plant on the Nisqually River was completed in 1945. This is the Alder Dam, concrete arch type, 330 ft. high, and 1,500 ft. long on top. It is two miles above the LaGrande Dam, which was completed late in 1944 and is of the concrete gravity type, 215 ft. high and 500 ft. long. For a large flood control project in California, which includes the Sacramento and American Rivers, the State, in cooperation with the Corps of Engineers, U. S. A. and the U. S. Bureau of Reclamation, has plans for about 15 dams. A project for a dam in the Columbia River (U. S. Engineers), near The Dalles, Oregon, and 53 miles above the Bonneville Dam, necessitated study of foundation conditions by divers in water 200 ft. deep, with a swift current. Dams in the Columbia and Willamette Rivers will require the relocation of 200 miles of railway and 100 miles of roads now within the reservoir areas. A rock dam or weir in the Colorado River, near Blythe, Calif., is to raise the water level 3 ft. to serve a new intake for the canal of the Palo Verde irrigation district.

The Kentucky Dam on the Tennessee River (Tennessee Valley Authority), dedicated October 10, is the largest of a series of dams and locks opening barge navigation from the Ohio up to Knoxville, Tenn., 650 miles. Work is to be resumed on other T.V.A. dams, halted by the war. At the Fontana concrete dam (T.V.A.), completed in 1945, special instruments were installed in the concrete to indicate its behavior or internal condition in relating to the grouting of joints and the controlled cooling of the concrete. Arkansas has given permission to a company to build a dam for rice irrigation across Two-Prairie Bayou. In Texas, near Waco, the Whitney Dam (U. S. Engineers), for flood control on the Brazos River, will be 190 ft. high, with 7,500 ft. of concrete and 4,500 ft. of earth embankment. The Brazos Reclamation Board proposes a power dam on this river and two flood control dams on its tributaries, the Leon and Lampasas rivers. The Barker Dam on Buffalo Bayou was completed as part of a flood control project for the protection of Houston.

Bids for completing the Merriman Dam (earth embankment, halted in 1942) on the new Delaware River water supply for New York City, were rejected in September, as being too much higher

than the original bids of 1939. One cause of the higher prices was the increase in labor rates. A flood control project (U. S. Engineers) involving 14 dams on the Potomac River has been abandoned on account of opposition to the flooding of fertile land by the reservoirs. A proposed flood protection dam at Springston, Idaho, on the Coeur d'Alene River, is also opposed, as the reservoir would submerge valuable mining properties. A concrete arch dam on the Green River, near Morrisville, Vt., is planned for increased storage for the local power plant. And Vermont has approved a dam at Thetford, as part of the flood control project (U. S. Engineers) for the Connecticut River.

Serious erosion of the face of the Kingsley Dam on the North Platte River, near Ogallala, Neb., (Central Nebraska Public Power & Irrigation District), due to high waves, has necessitated a protective covering or revetment of large concrete blocks and stone filling, part of which had to be placed under water. Emergency movable dams to stop the rush of water through locks in case of damage to the gates by ships, have been discussed in reports of the American Society of Civil Engineers.

In Mexico, the National Irrigation Commission plans several irrigation dams, and has built a new type of dam on the Conchos River, in Chihuahua. This Las Vergenes Dam, 157 ft. high, consists of a series of concrete walls parallel with the stream; their upstream ends are sloped and are enlarged to form T or mushroom heads which make contact with each other and so form the face of the dam. The new treaty with Mexico over the Rio Grande water provides for three storage and flood control dams. Bolivia plans five dams for irrigation and power, and has the Angostura Dam under construction. Brazil proposes a series of dams on the Sao Francisco River. Uruguay has built a dam at Rincon de Bonete, on the Rio Negro, similar to the Mexican dam described above.

A third raising of the great masonry dam at Aswan, on the Nile, in Egypt, is proposed. It was raised 16 ft. in 1912, and 33 ft. in 1933; the present plan is for an additional 38 ft. in height. The Union of South Africa is planning the Bethulie Dam on the Orange River, for irrigation and power development. In India, the government of the Punjab Province has contracted with an American firm for a concrete gravity dam 550 ft. high on the Sutlej river, to serve an irrigation project. In New Zealand, the government plans a series of ten power dams on the Waikato River.

Toward the close of the war, the Germans blew out the spillway gates of the Urft River dam, in Germany, but did not wreck the structure. This was one of five dams in the Ruhr industrial district which the Germans intended to destroy. They were prevented from doing so by the rapid advance of the Allied troops. On the other hand, the Allied troops bombed the Krebs Dam on the Rhine, near Basle, and thus blocked navigation by the Germans. In Holland, the Germans breached the Walcheren Dam in four places. These breaks had to be closed before the winter or Walcheren Island would have been flooded by the North Sea.

France has several projects for power dams, including four on the Dordogne River.

In England, the Ladybower Dam of the Derwent Valley Water Board was completed in November for additional water supply to a group of cities. Power projects in the north of Scotland will require three dams. The provincial government of Quebec, Canada, plans a power dam at Lake Dozois. Russia is said to plan a number of dams

for irrigation and power in both Asiatic and European Russia; it has repaired the Dneiper Dam and is replacing the power equipment removed by the Germans, as well as putting in new American machinery. In Iran (Persia) the Irrigation Administration, which is under American direction, built, on the Karun River, a weir or overflow dam composed of large, smooth boulders placed in two rows, with concrete filled in between them.

See Flood Control, Water Supply, Waterways.

E. E. RUSSELL TRATMAN.

DEFENSE TRANSPORTATION, Office of (ODT). V-J Day, August 14, brought a shift in the 1945 activities of the Office of Defense Transportation. Before that date the agency, under Director Col. J. Monroe Johnson, was vigorously engaged in securing the maximum utilization of the country's transportation facilities for the successful prosecution of the war. When Germany collapsed in May, transportation problems became more acute on the West Coast than on the East Coast. After V-J Day, the ODT began a process of demobilization, with the revocation of a number of orders and drastic cuts in personnel.

Reduction of ODT field offices proceeded rapidly after V-E and V-J Days. The liquid transport department was closed down entirely in September. All offices of the highway transport department and 14 railway department field offices were closed by Dec. 1.

By November, 23,000 special advisory committees in various fields of transportation had been dissolved. ODT Director J. Monroe Johnson remained in office into 1946 to supervise the working of the few remaining controls (chiefly affecting rail transportation) with a skeleton staff.

Existing controls over railroad freight traffic continued in the first half of 1945 and new and drastic restrictions were placed on passenger traffic. Vigorous measures were adopted to cut down civilian passenger travel to conserve rail passenger equipment. By the use of all publicity media, and the organization of volunteer cooperating local committees, the "Vacation-at-Home" idea was actively promulgated. During the spring and summer, professional and amateur sports authorities cooperated with the ODT to cut down sport-connected travel.

Voluntary cancellations of conventions were continuing as the year opened. In January, at the instance of the Office of War Mobilization and Reconversion, attendance at conventions and group meetings was limited to a maximum of 50 persons from out-of-town. The War Committee on Conventions, headed by Colonel Johnson, was set up to handle applications by sponsors and promoters of conventions, trade shows, fairs, and the like. During the 8 months existence of the "convention ban" (Feb. 1 to Oct. 1), 4,095 convention applications were reviewed by the committee and only 495 were approved. Resulting travel savings were estimated at nearly a billion railroad passenger miles.

Heavy rail movements of returning troops, from both European and Pacific theatres, called for such ODT measures as the elimination of sleeping car runs of less than 450 miles; shortening of advance passenger space reservation time to five, later to 14 days; assignment of about two thirds of all Pullman sleeping cars to military use; making available all passenger coaches for military use under ODT supervision; and the ordering of 1,200 new troop sleepers for military use. On the other hand, orders were revoked in August and September which had forbidden various special train services, such as

seasonal resort schedules, and the use of private cars.

In November, the ODT required air lines to assign to returning service men 70 percent of all space in plane flights from four West Coast to six East Coast points. This was the first ODT order affecting air service.

The Toledo, Peoria & Western Railroad, which had been operated by the ODT since early in 1942, was restored to private control in October. The Illinois Central Railroad, taken over by the ODT in August, 1945, following a labor dispute, continued operation without change of personnel, with an ODT official as Federal Manager.

Railroad manpower shortages, especially on the West Coast, engaged the attention of ODT officials throughout the year and various remedial steps were taken with the cooperation of the Army and other federal agencies.

In the opening months of the year, blizzards in the Northeast called for emergency measures to relieve railroad congestion. All through the year there was difficulty in supplying enough box cars to move grain in the West, and a number of emergency actions were taken by the ODT, the ICC, and the Association of American Railroads to relieve congestion and to rush box cars to the grain belt.

W. F. Kirk, Western Railway Director of ODT, continued his activities in routing railroad freight west of the Mississippi until Nov. 1, when his services were terminated.

The export permit system, set up to prevent congestion on rail lines leading to the ports by controlling shipments of freight consigned to overseas destinations, was ended in October.

On the nation's waterways, the early part of the year saw heavy movements of bulk commodities under ODT supervision. More steel barges were built to help handle the traffic. A volume of a million barrels a day of petroleum products was being moved over inland waterways during the first half of the year. Through the whole war period a total of 1,731,034,485 barrels of petroleum products was handled, besides 345,835,040 tons of iron ore; 62,827,283 tons of limestone and large quantities of other bulk commodities. After V-J Day the ODT gave up its controls over the chartering, sale, leasing, loading, routing, and operation of craft on inland waterways. On Nov. 29, the ODT took over the tugboat operations of the Great Lakes Towing Co., whose craft had been rendered idle by a strike.

During the first five months of the year the ODT speeded up rail shipments of petroleum products by imposing heavy penalty demurrage charges so as to compel swift loading and unloading of tank cars, and also by requiring daily reports on the status of every car. In the first quarter of 1945 a greater volume of petroleum and petroleum products was moved to the Atlantic seaboard than during any earlier comparable period in history—166,323,838 barrels.

During the first half of the year, the ODT highway transport department continued its campaigns to conserve local transit facilities, and to conserve tires and equipment; expanded its truck joint action program, and extended preference to veterans applying for certificates of war necessity.

After V-J Day came the lifting of a large number of controls over various classes of highway transportation. These included the regulation of bus, street car, and taxi operation; restriction of deliveries by truck; a road speed limit for motor vehicles, the rationing of new motor vehicles and

the restriction of their operation through the issuance of certificates of war necessity.

By Nov. 1, the ODT had returned to private operation 103 midwest trucking concerns which had been taken over in August, 1944. On July 28, 1945, the ODT ended its control of more than 1,600 trucking lines in Chicago and vicinity, which had been taken over on May 23 and June 15.

On Nov. 21, the ODT assumed control of the property of the Capital Transit Company operating street cars and buses in Washington, D. C. and suburban territory. The action was taken at the direction of President Truman, following two strikes within a period of two weeks. This control was terminated on Jan. 8, 1946.

The War Production Board Controlled Materials Plan terminated Sept. 30. Under this plan, the ODT had been claimant agency for the transportation industry. As such, during the 3½ years ending June 30, 1945, it had secured the production of: 1,082 steam, 1,741 diesel electric, 38 electric locomotives; 155,002 freight cars, 1,200 troop sleepers and 400 kitchen cars; 181,146 trucks and tractors; 19,580 integral buses; 5,572,392 tons of replacement rail.

An additional 1,200 troop sleepers and 400 kitchen cars to be built under ODT sponsorship were scheduled for completion by the end of the year, but owing to labor difficulties less than half of them were actually finished by that time. Production of the first railroad passenger train cars since 1942 was scheduled to begin late in the year, with 750 due for completion by June, 1946.

J. M. JOHNSON.

DENMARK. A kingdom of northwestern Europe, comprising the peninsula of Jutland, the two main islands of Zealand and Fyn, and about 200 smaller adjacent islands in the Baltic. Denmark was occupied by German armed forces from April 9, 1940, until May 5, 1945. The Faeroe Islands (q.v.) an integral part of the kingdom, were occupied by British troops on April 13, 1940, for the duration of the war. Greenland (q.v.), a Danish dependency, remained under the control of the local Danish administration but accepted United States protection for the duration of the conflict. The King of Denmark was King of Iceland (q.v.) until June 17, 1944, when the independent Republic of Iceland was established. Capital of Denmark, Copenhagen. King, Christian X, who succeeded to the throne May 14, 1912.

Area and Population. Total area excluding the outlying possessions, 16,575 square miles. Estimated population, July 1, 1942, 3,903,000, as compared with 3,844,000 at the census of Nov. 5, 1940. The live birth rate per 1,000 inhabitants was 21.3 in 1943 (20.9 in 1942); death rate, 9.6 (9.6). There were 37,846 marriages in 1943 (37,479 in 1942). Populations of the chief cities (1940 estimate): Copenhagen 890,130, Aarhus 99,881, Odense 85,521, Aalborg 55,621.

Government. The Constitution of June 5, 1915, as amended Sept. 10, 1920, vests executive power in the King acting through a cabinet responsible to the Rigsdag (Parliament). Legislative power rests jointly in the King and Rigsdag. The Folketing (lower chamber of the Rigsdag) consists of 149 members elected for four years by proportional representation. The Landsting (upper chamber) comprises 76 members serving for eight years; its powers are very limited.

Education and Religion. There is no illiteracy. The elementary schools had 407,355 pupils in 1940; secondary and middle schools 67,064; the two uni-

versities had 6,474 students enrolled. The 1921 census showed 3,221,843 Protestants, 22,137 Roman Catholics, 5,947 Jews, and 17,349 others.

Production. Denmark is essentially a land of intensive dairy farming. Industry, however, is also important, despite an almost complete lack of minerals and water power. Shipbuilding, in particular, is a leading Danish industry. Before the war 35 percent of the working population was employed in agriculture and dairying and 33 percent in industry. Commerce and fishing were the other important occupations. It was estimated in July, 1945, that Denmark at the end of the German occupation still possessed the following percentages of its prewar livestock: horned cattle, 97 percent; pigs, 52; poultry, 54; horses, 106.

Foreign Trade. In 1944 the total value of imports was estimated at 1,167,600,000 crowns; exports, 1,347,600,000 crowns. As in previous years during the occupation, Germany accounted for about 70 percent of Denmark's foreign commerce both on the import and export side. Germany's accumulated debt on clearing account totalled 2,692,000,000 crowns on Sept. 30, 1944, not including occupation costs.

Events, 1945. The Long Vigil. The early months of 1945 were, in many respects, the hardest and most trying in Denmark's five years of suffering under the Nazi heel. Hard pressed by victorious Allied forces closing in on the Reich from east, west, and south, the Germans in desperation looked to the north as a potential last refuge and stronghold. Evacuees from the bomb-scarred cities of Germany streamed by the tens of thousands into the comparative safety of Danish towns and villages. This influx of unwelcome guests further aggravated the serious shortages of housing, clothing, fuel, and other essentials which the critical phase of the war had caused in Denmark as in other occupied countries. However, thanks to the country's highly developed agriculture and dairy industry, the food situation remained comparatively satisfactory.

Nerves were taut on both sides and violence increased daily. Winston Churchill, in a New Year's message to the Danish Resistance movement, declared: "Now, as the enemy is near defeat and becomes more violent, we must all stand firm. We must strengthen our grip to hasten the end. With cool heads and stout hearts let us march together to the victory which will restore the ancient liberties of the Danish people."

The Danish resistance fighters responded magnificently to this call for daring action to hasten the defeat of the tottering enemy. Their most effective contribution to victory was a large-scale sabotage campaign which at the most critical moment paralyzed the Danish railroad system, especially in Jutland, and greatly impeded the planned transfer of German troops from Finland via Norway to the Western front. General Dwight D. Eisenhower, in a special communiqué issued on March 5, declared that attacks by the Danish underground on German troop movements had become so effective that not a single train was able to reach Germany without having been delayed. "This action by Danish saboteurs is an effective contribution to current military operations on both the Western and Eastern Fronts," the communiqué said.

As Danish resistance stiffened and spread, the Gestapo intensified its repressive action. More Danish patriots were executed in the first four months of 1945 than had been put to death in all the four preceding years. Street clashes between patriots and quislings also increased in frequency and ferocity. During the first half of January, 51

persons were killed, with the toll almost equally divided between friends and foes of the Germans. The last week of February cost sixty lives.

Meanwhile, signs of a serious rift within the Nazi leadership multiplied. Early in February, the German commander in Denmark, General Hermann von Hanneken, was relieved of his command, after widespread mutinies and rioting had occurred among his forces. He was succeeded by General Georg Lindemann, former commander in the Baltic sector of the Eastern front. No sooner had Lindemann arrived at his Danish headquarters at Silkeborg in Jutland, than the building was blown up by saboteurs on Feb. 23; the general went scot-free, though, as he had done a few days earlier when an attempt was made on the train carrying him to Silkeborg. There were also conflicts between the German Minister (virtually the civil governor) in Copenhagen, Werner Best, and high officers of the S.S. and the Gestapo, especially Police General Guenther Pancke.

On March 21, at noon, the Gestapo headquarters in Copenhagen, in the American-owned Shell House office building, was destroyed completely in a daring raid by six British mosquito bombers. A large number of Gestapo officials, both German and Danish, were killed in the attack, but eight Danish patriots, held as hostages in the building, also lost their lives. However, twenty others, including Dr. Mogens Fog, head of the Freedom Council, the central organization of the Resistance movement, escaped in the confusion.

April was a month of nerve-racking uncertainty for the Danes who were alternately swayed by hopes of imminent liberation and despair at the prospect of being caught in a long-drawn-out struggle for "Fortress Denmark." On the occasion of the fifth anniversary of the German invasion, on April 9, President Roosevelt sent a message to the Danish and Norwegian peoples in which he promised, "Very soon the period of martyrdom will be ended." And British Foreign Minister Anthony Eden declared: "Today Denmark's greatest hour is close at hand."

Liberation. The suddenness and swiftness of the German collapse in the last days of April and the first days of May came as a great surprise to the Danes. Up to the last minute, the Nazis were working feverishly on the elaborate system of fortifications laid out especially on the west coast of Jutland.

The first break in the hitherto iron-bound German control occurred on May 1, when Danish correspondents of Allied newspapers again were able to telephone stories to Stockholm. The following day, however, censorship was restored, and demonstrators again were arrested by the Gestapo, which had its last, ineffectual fling at terrorism.

"Denmark's greatest hour," as Mr. Eden had put it, finally struck on May 4, when the surrender of German troops in Denmark was announced, as British forces on the Jutland Peninsula raced across the Danish border. Instantly, strategic points in Copenhagen and elsewhere were taken over by armed men under the direction of the Freedom Council. Delirious crowds surged into the streets, wildly singing, shouting, waving Allied and Danish flags. Although the oft-predicted "night of the long knives" did not materialize, a good deal of unnecessary bloodshed occurred as Nazi stalwarts and Danish traitors engaged in local skirmishes with the Resistance forces. About sixty people were killed and several hundred were wounded in this fighting, which continued even after the arrival in Copenhagen of British airborne troops on May 5.

Even before the announcement of the German surrender, King Christian stood ready to restore constitutional guarantees and a national administration. As early as May 2, he summoned former Premier Vilhelm Buhl, leader of the Social-Democrats, and asked him to form a Cabinet as soon as conditions permitted. From all parts of the country, members of Parliament started out toward the capital in anticipation of a royal rescript convening the Rigsdag. This was issued on May 7. Two days later the Rigsdag met to hear an opening address by Premier Buhl who promised a speedy return to normal conditions. The new government was based on a coalition of all major parties, with the Resistance leader John Christmas Moeller in the post of Foreign Minister and other underground leaders in various key positions.

The Purge. In his speech to the Rigsdag, Premier Buhl promised that Danish collaborationists would be brought to book and all illicit gains made during the period of occupation would be confiscated. Actually, by that time a good many "stikkere" (Gestapo informers) already had been liquidated by the wrathful patriots and thousands of Danish Nazis had been taken into custody.

Among those arrested in the first days following liberation was the notorious chief of the Danish Nazi party, Fritz Clausen, who had vainly attempted to escape across the South Jutland frontier into German territory. Jens Moeller, leader of the German minority in South Jutland (North Schleswig), also was seized. The German envoy and plenipotentiary in Copenhagen, Werner Best, surrendered voluntarily to Resistance forces. Other prominent prisoners included Peter Knutzen, director general of the Danish State Railways; former Minister of Public Works Gunnar Larsen; and Helmer Rosting, president of the Danish Red Cross and former High Commissioner for Danzig, who later committed suicide. Fifty officers of the army and navy were dismissed and degraded. The list was headed by Colonel Christian P. Kryssing, who had organized a Danish volunteer corps that fought with the Germans on the Eastern front.

By the end of May, arrests of traitors and collaborationists totalled 12,000 of whom about 7,000 were expected to be brought to trial. On May 25 a bill providing severe penalties, including death, for crimes committed in the service of the Germans during the occupation was submitted in Parliament by the Minister of Justice Busch-Jensen. The bill was passed by the Rigsdag and signed by the King early in June. Up to the end of the year, however, no major trial of either German war criminals or Danish traitors had taken place in Denmark.

Reconstruction Tasks. Although on the whole less grave than in other liberated countries, the economic problems facing the Buhl Government were manifold and pressing. Foremost among them was the fuel shortage which remained acute throughout the year. Normally Denmark, which has no raw materials herself, imports all her coal from Germany and Great Britain. With the former knocked out completely from international trade, and the latter unable, for some time to come, to resume exports of coal on a prewar scale, the Danes were getting barely enough fuel to supply the most urgent public services. As a result, Danish industry, in the months following liberation, was almost completely paralyzed and unemployment, which took a sharp upward turn, was expected to reach a quarter of a million people in mid-winter—a disastrous figure for such a small country. Like Sweden, Denmark sought relief in

a trade agreement with Poland, but there was little hope that substantial deliveries of coal from that country could be expected before some time in 1946.

Another economic problem for Denmark was, paradoxically in a semi-starved Europe, a surplus of meat that began to accumulate in July and by mid-September amounted to 3,000 to 4,000 tons a week of beef alone. Not that there were no willing takers for this surplus, but lack of shipping space prevented its export to where it was most needed. Shipments of bacon, butter, and eggs to Britain—Denmark's best customer for such produce before the war—were resumed, but only on a limited scale, and the Danes complained that the ships mostly returned empty, instead of carrying raw materials and industrial products from Britain as before the war.

Public works costing 600,000,000 kroner—more than the total yearly expenditure of the state before the war—were planned by the government in an attempt to cope with the critical employment situation.

A source of considerable worry for the government was also the presence of about 600,000 Germans in the country at the time of the capitulation, of whom about one-half were members of the armed forces and the other half were evacuees, administrative personnel, and "carpet-baggers." By the end of June virtually all the military had been sent back to Germany, but there was not enough transportation available for all the civilians, nor were there reception centers ready for them in the Reich. Thus, large numbers of German civilians stayed on in Denmark throughout the year, despite growing protests from the native population.

An official announcement from SHAEF on July 9 declared its mission in Denmark to be about completed, and by the end of November all Allied forces had been withdrawn from Danish territory with the exception of a small Russian garrison that remained on the island of Bornholm. There was much wondering in Denmark whether the Russians perhaps intended to stay on the strategic island, but Moscow disclaimed all annexionist designs. Despite their unexplained lingering on Bornholm, the Russians scrupulously refrained from interfering with the Danish administration of the island and the relationship between them and the local population was good.

Denmark Admitted to United Nations. The question of whether Denmark, although she never had a chance to declare war on Germany, should be regarded as one of the United Nations was taken up and favorably decided at the San Francisco Conference. On June 1, Wilhelm M. Morgensstjerne, Norwegian Ambassador to Washington, presented a formal request to Secretary of State Stettinius that Denmark should be admitted to full membership. According to Mr. Morgensstjerne, Denmark "because of her geographical and military situation was not in a position to resist the aggressor, who wantonly and without any warning attacked and occupied Danish soil." The motion to admit Denmark was offered to the executive committee by Lord Halifax of Great Britain, and seconded by Dr. Alexander Loudon of the Netherlands and Joseph Paul-Boncour of France. On June 5—the 96th anniversary of the Danish Constitution and a national holiday in Denmark—the Conference by unanimous vote invited Denmark to become the fiftieth of the United Nations.

A few days earlier, on May 21, Foreign Minister Moeller, in a speech at Hilleroed, expressed the view that Denmark in actual fact had been at war

with Germany ever since the great revolt of August 29, 1943. He concluded: "But when Denmark has been fighting Germany since 1943, it means that we are still at war with Germany. To me there is no difference between Denmark's position and that of the Allied countries. They as well as Denmark are at war with Germany, they as well as Denmark have suspended hostilities, but Denmark's war with Germany does not cease until the day peace is concluded."

On Sept. 11 the Danish Ministry of Foreign Affairs announced that Denmark had ratified the United Nations Pact, together with the statute for an International Court of Justice. The Danish Government also authorized the formation, in November, of a division of 11,432 men to assist in the Allied occupation of Germany, some time in the spring of 1946.

The South Schleswig Question. Immediately after the fall of Germany, a movement sprang up in Denmark for the annexation of South Schleswig which had belonged to the Danish Crown up to the war of 1864. After World War I, Denmark recovered the northern half of the lost province (North Schleswig) by virtue of a plebiscite held in 1920 under international control, but at the same time the inhabitants of South Schleswig voted overwhelmingly against secession from Germany.

Claiming that in spite of the international commission many Danes in 1920 had been coerced by German landlords and officials into voting for Germany, and that since then the Danish minority in South Schleswig had been ruthlessly dealt with—especially under the Nazi regime—wide circles in Denmark held that the time had come to extend the country's frontier to the old border, or even as far as the Kiel Canal. Others favored the establishment of an autonomous state of Schleswig with a mixed Danish and German administration.

From the start, however, the Buhl Government firmly opposed all such plans, supported in this stand by a majority of the influential press organs. Both the Premier and his Foreign Minister repeatedly spoke out against annexation. In an address to the Social-Democratic Congress in Copenhagen, on August 21, Mr. Buhl declared: "Denmark has no frontier problem. The Danish south frontier was firmly fixed according to the plebiscite following the first World War. The violent events of the past few years have overthrown many frontier agreements, but the relationship between the Danes and Germans must be viewed against the historical background; only irresponsible people could believe that the German people will forever remain a weak and exhausted nation. The Danish Social-Democrats wish to state firmly and clearly that we oppose any attempt designed directly or indirectly to bring the South Schleswig territories under Danish sovereignty or administration."

In spite of this official attitude the Schleswig question continued to agitate public opinion, especially after it had been learned that several hundred thousand evacuees from the former German territories east of the Oder were on their way to South Schleswig for resettlement. Fearing that this influx of Germans would completely swamp the Danish minority in South Schleswig, the influential South Jutland-Danish Associations on Oct. 11 published an appeal to the government to intervene with the Allied Control Council. But the British authorities of occupation in North Germany declared that Schleswig, like any other part of Western Germany, must take its share of evacuees from the east. Otherwise, the British took no stand for

or against the Danish claims to South Schleswig.

Elections and a New Government. On Oct. 30, a general election was held in Denmark, preceded by a lively campaign during which a futile attempt was made to merge the Social-Democratic and Communist parties. Participation was exceptionally heavy, about 90 percent, with 2,049,536 votes cast.

The results were pretty much what had been expected: the Social-Democrats lost heavily, while the Communists gained correspondingly. On the right, the Agrarian party made some gains at the expense of the Conservatives. This is how the vote compared with the last election, in 1943:

	1945	1943	(1939)
Social-Democrats	671,664	894,636	
Agrarians	480,000	378,463	
Conservatives	373,854	421,051	
Communists	255,183		(40,893)
Radicals (Liberals)	166,843	175,025	

In the new Rigsdag, the Social-Democrats hold only 48 seats as compared with 66 in the old; the Agrarian party has 38, a gain of ten; the Conservatives lost five, retaining 26; the Radicals have 12 (—1); and the Communists now have 18 as against three before the war. Two small groups hold four and three seats, respectively.

As a result of this election, the Buhl Cabinet resigned on Oct. 31. Attempts of the outgoing Premier to form a new coalition government met with no success. On Nov. 3, King Christian asked the Agrarian leader Knud Kristensen, who had been Minister of Interior in the Buhl Cabinet, to form a government. Hesitatingly, Mr. Kristensen accepted. On Nov. 6 he presented his Cabinet list to the King.

The new Danish Government, headed by Mr. Kristensen, is an all-Agrarian Cabinet, without a majority in the Rigsdag, and supported only, in a non-committal way, by the Radicals. All other parties have adopted a wait-and-see policy toward it. Of the Cabinet members, none was previously well known outside of Denmark.

JOACHIM JOESTEN.

DENTISTRY. The end of 1945 found dentistry at low tide with little to indicate any upswing. Dentists released by the armed services are inclined to relax or to engage in post-graduate and refresher courses before resuming civilian practice which more than 90 percent intend to do. Private practitioners are still struggling unsuccessfully with the problem of how to do more work for more people. Abandoned by the Army and Navy, dental schools are facing a year in which their available facilities for first year students will be only about half used. Book and magazine production is at a very low level. The social and economic problems facing dentistry seem staggering and solution of them remote and not very promising.

Organized Dentistry. All general meetings were cancelled. Small groups met to elect officers, prepare budgets and transact only essential business. Most significant were the conferences and group meetings having to do with public health and post-war planning. Very pertinent thereto are the figures presented to such groups for the number of United States dentists and the dentist-population ratio now, in the past, and projected into the future. For the first time in a century during the 1930-1940 decade there was an actual decrease in the number of dentists, but at the same time a considerable increase in population. Surveys indicate no diminution of the need for dental care. The estimates of the work urgently required are fan-

tastically in excess of all available facilities. The two most serious deficiencies are personnel and money. The measures suggested include above all the promotion of research and most especially in the area of prevention and control of dental disease, the increase materially of the number of persons studying dentistry so as to enlarge personnel, the hearty support of all programs for dental care of children so as to secure early correction of all dental defects, and the conduct of ample projects for public health education in the field of conservation of dental health. There is strong support for a national institute for dental research; a bill has been introduced into the Congress to that end. The health departments of 27 states supply one or more laboratory services for dentists and their patients, such as examination of bacterial smears, salivary bacterial counts and biopsy tests.

Education. The names of the 36 accredited dental schools were released by the Council on Dental Education in June. Of these only 24 are rated as fully approved. Since then one of the approved schools (Columbia) has been suspended temporarily by the Council and also taken from the state list of approved schools by New Jersey. These actions followed the announcement of President Butler of Columbia that the faculty of dentistry had been integrated with the faculty of medicine and was to be called the School of Dental and Oral Surgery. The Army terminated its program of dental education very abruptly. The Navy's withdrawal has been gradual and will be completed by some time well into 1946. The net result of these acts and the activities of induction boards is a 1945-1946 first-year class in the U. S. dental Schools of just about half that of the war years of 1944 and 1943, and well under that of any recent year. This will serve to hamper seriously the announced programs for the conservation of dental health. The University of Washington has established a dental school in Seattle. This coupled with the project of the Department of Higher Education of Oregon to take over a long existent school in Portland will supply the North Pacific area with adequate facilities for training dentists. The University of Norway has transplanted temporarily a major portion of its program for the training of dentists to three United States dental schools; the number of students involved is 42.

General. The fluorine projects at Grand Rapids, Michigan, and Newburg, N. Y., are in full operation. It is expected that the addition of fluorides to the domestic water supply will very materially reduce (35 to 60 percent) the amount of dental caries in children born and raised in these communities. Evanston, Ill., and Marshall, Texas, have reported adoption of this procedure. This seems to be the only current approach to mass reduction of dental disease in children that is not heavily handicapped by the lack of funds or dental personnel. Some 267 items in the periodical literature of 1945 seemed worth abstracting for general distribution. The selections were made from dental, medical and scientific journals both here and abroad. Of these 105 were printed in other than dental journals and there were included 40 articles from foreign periodicals. As usual the subject of prosthetics (dentures, tooth crowns and bridgework) received most attention. Next in order were anesthesia, oral surgery and the public health aspects of dental practice. Much attention was given to the use of penicillin in the treatment and control of mouth infections. It is considered as an agent of great value. Research output, as measured by the number of articles printed and items reported

at scientific meetings, is less than half that of the prewar years, perhaps as low as one-third. Book printings announced are chiefly new editions of existing texts but the technique of practice is without noteworthy change, and the trend to a greater use of the newer synthetic plastics is continued.

EDWARD H. HATTON.

DISCIPLES OF CHRIST. A communion known also as the Churches of Christ and Christian Churches, which sprang from a movement for Christian unity in American Presbyterian circles at the beginning of the 19th century, under Barton W. Stone in Kentucky, and Thomas and Alexander Campbell in Western Pennsylvania. The largest religious body having its origin in America, it ranked fifth among Protestant communions in the United States in 1945. In policy the churches are congregational. There are six major agencies of the communion: The United Christian Missionary Society; Board of Higher Education; Association for the Promotion of Christian Unity; Pension Fund; National Benevolent Association; Board of Church Extension; besides the missionary societies of the several states and provinces of Canada. These agencies are corporations and are affiliated with the International Convention of Disciples of Christ which meets annually. The general missionary work both home and foreign of the churches is administered through The United Christian Missionary Society, with headquarters at 222 Downey Avenue, Indianapolis, Ind. Its board of managers of 120 is composed of sixty men and sixty women. The foreign missionary work in 1945 embraced the Belgian Congo in Africa, China, India, Jamaica, Japan, Mexico, Philippine Islands, Puerto Rico, Argentina, Paraguay and Batang, on the border of Tibet. However, because of the war, work in Japan and the Philippine Islands was suspended.

Statistics of the communion show that during the year there were 4,430 baptisms in the foreign fields. The 317 mission schools had a total enrollment of 13,374. The communion maintained 11 hospitals and 20 dispensaries which gave 653,111 treatments. The Church Extension Fund amounted to \$3,003,955 with outstanding loans to 265 churches. The Pension Fund for the ministry showed assets of \$4,635,793. One hundred young people's conferences were held. Work in America was conducted among the French, "Appalachian Highlanders," European immigrants, Negroes, Orientals, Spanish-Americans, and Mexicans. The National Benevolent Association maintained six homes for children, and an equal number of homes for the aged. In 1945, 28 Colleges, Universities, Bible Colleges and Foundations cooperated with the Board of Higher Education. The total church membership throughout the world in 1945 was 1,943,441; and in the United States and Canada 1,776,878. The Bible school enrolment for the world was 1,113,478, and for the United States and Canada, 1,013,679. Contributions, missionary, benevolence and educational, reported for the fiscal year in the United States and Canada totaled \$8,759,872.

Among the periodicals published by the communion are *World Call*, *The Christian-Evangelist*, *Christian Standard*, and *Front Rank*. The president of the International Convention was Dr. M. E. Sadler, Fort Worth, Texas.

DOGS. A ruling by the Office of Defense Transportation early in the year (rescinded shortly after V-J Day) that shows be limited to local exhibitors greatly curtailed the "traveling" schedule of the

canine stars in 1945. Among the many exhibitions thus ruled off the boards was the big Eastern Club event, which had been held for thirty-three consecutive years at Boston.

However, the indoor classic of dogdom, Westminster Kennel Club's show, was held for the sixty-ninth season and 2,653 entries, representing 102 breeds, were benched in New York's Madison Square Garden.

Shieling's Signature, Scottish terrier owned by Mr. and Mrs. T. H. Snethen of Allison Park, Pa., and shown in the ring by Mr. Snethen, won the coveted best-in-show award in addition to the prize for the best American-bred dog.

Capping the field trial season were the national retriever championships at Shelter Island, N. Y., and Black Magic, a black Labrador bitch owned by Mahlon B. Wallace of St. Louis, captured first honors. Second youngest entrant in the meet, Black Magic of Audlon gave a nearly perfect performance to defeat such strong rivals as Shelter Cove Beauty, the 1944 victor, and Shed of Arden, champion in 1942 and '43.

Of interest to dog lovers last year was the return from the wars of many members of the K-9 Corps, and glowing records of faithfulness and bravery on both the European and Pacific fronts came back with them.

THOMAS V. HANEY.

DOMINICAN REPUBLIC. A republic of the West Indies occupying the eastern part of the island of Hispaniola. Area: 19,332 square miles. Population: 1,969,773 (1944). Capital: Ciudad Trujillo.

Most of the land surface is mountainous, with steep, narrow ranges separated by deep valleys and pocketlike lowlands. There are two principal lowland plains; one between mountain ranges parallel to the north coast, the other along the southern coast. High temperatures prevail in the lowlands throughout the year.

Government. Under the Constitution of 1942, the Dominican Republic is a centralized republic of 15 provinces. It has a bi-cameral legislature: a Senate of 16 members, and a Chamber of Deputies of 38 members. Members serve for 5-year terms. The president is elected for a 5-year term and is assisted by 13 advisers, 8 of whom are ministers. Generalissimo Rafael Leonidas Trujillo Molina was elected President on May 16, 1942, for his third term.

The People. According to the census of 1935, the population is composed of mestizos (71 per cent), Negroes (16 per cent), and whites (13 per cent). Most of the people are concentrated near Santiago and on the southern coastal plain. The chief cities are: Ciudad Trujillo, 80,000; Santiago de los Caballeros, 34,000; and San Pedro de Macoris, 19,000.

Spanish is the official language. Roman Catholicism is the predominant religion.

In 1942 it was estimated 33 per cent of the population was literate. In 1943, there were 1,896 primary schools with a total enrollment of 203,990; and 79 secondary schools with a total of 7,545 students. In 1940 the University of Santo Domingo had 868 students.

National Economy. The economy of the country is almost entirely agricultural. The Dominican Republic ranks fourth among Latin American countries in the production of sugar, its chief crop and most important industry. Production of cacao and coffee are next in importance. Other crops are: corn, mandioca, rice, sweet potatoes, beans, and plantains, grown chiefly for domestic consump-

tion. Yucca is cultivated both for its food value and for the manufacture of starch for export. The 1944-45 coffee crop amounted to about 425,000 bags (of 60 kilograms each); production of sugar for the 1944-45 crop year was 368,892 metric tons; in 1943 cacao production totaled 20,058,835 kilograms.

Processing of agricultural products constitutes the chief manufacturing of the country, which is largely for local consumption. During 1944, however, some exports were made of beer, peanut meal, candles, cigars and cigarettes, sole leather, shoes, hats and furniture.

Foreign Trade. Dominican exports for 1944 totaled \$60,269,328. Sugar and molasses accounted for most of the country's export trade; cacao, coffee and yucca starch made a large part of the remainder. Raw sugar exports in 1944 totaled 749,462 metric tons, most of which went to the United Kingdom. Refined sugar amounting to 5,604 metric tons was exported in that year, the largest buyer being the Netherlands West Indies. In 1944-45 a total of 21,278,578 gallons of molasses were exported; practically all was shipped to the United States. Exports of cacao in 1944 totaled 25,562,120 kilograms, valued at \$3,999,527; exports of chocolate amounted to 186,218 kilograms, valued at \$66,018. The exportable coffee crop for 1944-45 amounted to about 300,000 bags of 60 kilograms. Yucca starch amounting to 12,285,313 kilograms, valued at \$1,659,841, was exported in 1944. The Dominican Republic also exports a variety of fruits, of which oranges are the most important.

Imports into the Dominican Republic in 1944 were valued at \$18,524,575. Manufactured and semi-manufactured products, and raw materials are the principal items imported. Textiles accounted for a good share of 1944 imports.

Events, 1945. In a letter to political leaders on May 30, President Trujillo asked them to reorganize the political parties of the Dominican Republic, which had been dormant since he assumed power in 1930. Two weeks later, reorganization was in progress. Former President Rafael Estrella Urena headed the Republican Party, and former Health Minister Wenceslao Medrano the Independent Labor Party. Five former Cabinet Ministers were organizing a new National Democratic Party. This activity was reported to be in preparation for national elections in May 1947. (Estrella Urena died on Sept. 26 and was succeeded in the Republican leadership by Jafet D. Hernández.)

Dominican political exiles abroad charged that these alleged "opposition" parties were all financed by Trujillo and led by his friends. In March exiled leaders met in Havana and formed a Dominican United Liberation Front, which appealed to the Dominican people to seek freedom. Their attacks on Trujillo were supported in other countries. Former President Eduardo Santos of Colombia and two other prominent Colombian politicians, Luis Cano and Roberto Ordaneta, assailed the Dominican "dictatorship" in a message "to the thinking men of the Americas." And 66 prominent United States citizens urged Trujillo to free imprisoned students and their parents and to grant the opposition the right to campaign for free elections. The Dominican delegation to a World Youth Congress held in London during November was excluded from the meeting after other American delegates had protested that their country was fascist. In September the Dominican United Liberation Front opened a

campaign urging other nations of the hemisphere to exert pressure on Trujillo to call elections.

There were persistent but unconfirmed reports throughout the year of wide-spread arrests and repressive action against a growing opposition movement within the country. These were denied by the Dominican Legation in Venezuela, the country in which most of the rumors originated.

A 1945 budget of \$21,418,133 was approved in January. It included funds for the improvement of Ciudad Trujillo port facilities, building of a cement factory, and construction of a new presidential palace. On April 7 Trujillo revealed a plan to establish an Agricultural and Mortgage Bank. On May 3 Congress authorized the creation of a Cabinet Department of Labor and National Economy, "to coordinate the action of the state with measures depending on private action or cooperation." Early in the fall Trujillo sent to Congress a bill providing for free public instruction in secondary and normal schools. And on Nov. 20 the President asked for a five-million-dollar appropriation to build 25,000 low-cost homes for workers.

It was announced in January that since Trujillo's assumption of power the republic's foreign debt had dropped from \$20,000,000 in 1930 to less than \$12,000,000 at the end of 1944. And the Government had repaid some \$500,000 to the United States under Lend-Lease arrangements.

The outstanding event in the field of foreign affairs was the establishment of diplomatic relations with the Soviet Union, announced on March 12. During the San Francisco Conference of the United Nations, the Dominican Republic and China signed a non-discriminatory immigration agreement. On November 26 the Government reaffirmed its pledge to provide sanctuary for persons persecuted because of race, religion or political beliefs, and the President established a committee to promote and supervise Jewish immigration to the Dominican Republic.

HARRY B. MURKLAND.

DUKE ENDOWMENT. A foundation created by James B. Duke in 1924, known for its connection with Duke University, hospital work, and a number of other activities in the Carolinas. The Endowment is a permanent one with a self-perpetuating board of 15 trustees. Except for the \$17,000,000 spent in erecting and equipping Duke University, it is authorized to expend none of its principal. A report covering its first 16 years, ended Dec. 31, 1944, showed that the Endowment had distributed and allocated \$59,364,343.99 as follows: Duke University, \$33,203,784.06; hospitals, \$17,855,852.03; Davidson College, \$1,420,728.28; Furman University, \$1,419,267.54; Johnson C. Smith University, \$1,009,459.68; orphanages, \$2,305,889.13; superannuated Methodist preachers, \$471,691.50; rural Methodist churches, \$774,213.93 for building and \$903,457.84 for operations. Chairman of the Trustees: George C. Allen. Headquarters: Power Building, Charlotte, N. C.

EARTHQUAKES. The past year was a fortunate one in that there were no destructive earthquakes reported anywhere in the world. The seismological observatories recorded the usual number of earthquakes but these were either sufficiently moderate that little damage resulted or they were located under the sea or in uninhabited regions. Perhaps the most newsworthy earthquake during the year was the one felt in the western Carolinas and northern Georgia on July 26. Despite the severe earthquake at Charleston, S.C., in 1886, this region

is not considered seismically active and the quake there this year was a long succession of relatively moderate shocks.

RICHMOND T. ZOCH.

ECONOMIC FOREIGN POLICY. Executive Committee on. A Committee created by letter of Apr. 5, 1944, from the President to the Department of State and the other interested agencies (listed below). Its function is to examine problems and developments affecting the economic foreign policy of the United States and to formulate recommendations in regard thereto for the consideration of the Secretary of State, and, in appropriate cases, of the President.

The Committee consists of representatives of the Departments of State, the Treasury, Agriculture, Commerce, and Labor, the U. S. Tariff Commission, and the Foreign Economic Administration. Representatives of other departments and agencies are invited to participate when matters of special interest to them are under consideration. Chairman (an officer of the Department of State designated by the Secretary of State): William L. Clayton.

ECUADOR. A republic of South America. Area: National territory, including the Galápagos Islands, and following settlement of the frontier dispute with Peru, is estimated to be 264,880 square kilometers. Population: 3,171,376 (1943). Capital: Quito.

Ecuador is divided into three regions: coastal, sierra or Andean highlands; and Oriente or Amazon region. The climate varies from tropical in the eastern and western lowlands, through temperate in the plateaus, to cold on high mountain peaks.

Government. Ecuador is a centralized republic of 17 provinces. (The Galápagos territory was given provincial status in 1945.) The Constitution of 1945, succeeding the Constitution of 1906, provides for a unicameral legislature, the Chamber of Deputies, composed of 3 deputies for each province having up to 150,000 inhabitants and increasing by 1 deputy for each 75,000 additional inhabitants. Two deputies will be elected by each of the eastern provinces as long as their population is less than 150,000, and the Galápagos Islands will elect 1. There will also be "functional" deputies representing certain business and professional groups. The Congress will meet annually on Aug. 10 for 90 days. Deputies are elected for 2-year periods. The president is elected for a 4-year term. Dr. José María Velasco Ibarra has been President since May 28, 1944.

The People. The people of Ecuador are almost evenly divided between Indians, who live in the Oriente, and those of Spanish and Indian origin who live in the coastal zone. About 4 percent of the population are Negroes, living mostly in the tropical coastal lowlands. The largest cities are: Quito, 165,924; Guayaquil, 172,948; and Cuenca, 52,519.

Spanish is the official language, but Indian dialects are widely spoken and taught in some communities. Roman Catholicism is the predominant religion.

It is estimated that 38 percent of the population is literate. In 1942 there were 3,181 primary schools with a total of 275,046 students, 70 intermediate schools with 11,193 students, and 4 universities with a total enrollment of 1,885.

National Economy. Ecuador is primarily an agricultural country. Rice, cacao, and coffee are the leading crops, but sugar, corn, potatoes, barley, wheat, bananas, and other fruits are also important. Cattle and sheep raising is the leading

pastoral industry. Forest products, including rubber, balsa wood, kapok, and tagua nuts are exported. In 1944, rice production totaled 1,752,217 quintals; cacao production amounted to 294,516 quintals; and the coffee crop totaled 350,000 quintals.

Ecuador's principal mineral products are petroleum, gold, silver, and copper. In 1944 production of crude petroleum rose 25 percent above 1943 and totaled 121,471,895 gallons; refined petroleum products rose 17 percent to 40,371,029 gallons.

There is little manufacturing in Ecuador, textiles making up the leading industry. Shoes, cement, sugar, flour, soap, and candles are produced for the home market, and toquilla (Panama) hats are exported.

Foreign Trade. Ecuadoran exports in 1943 totaled 393,144,000 sucres. Major products exported were: rice, coffee, cacao, rubber, Panama hats, balsa, and bananas. In 1944 crude petroleum exports totaled 251,275 metric tons. The U.S. is the leading market for Ecuador's exports, taking 85 percent of the cacao and 89 percent of the coffee exports in 1943 and 1944. Other important purchasers are Cuba, Peru, Venezuela, and Chile.

Imports in 1943 were valued at 217,982,000 sucres. Principal imports include: foodstuffs, beverages, cotton textiles, pharmaceuticals, machinery, metals and manufactures. In 1943 and 1944 the United States supplied about one-half of Ecuador's total imports. Other leading sources of imports were: Peru, Argentina, Mexico, Great Britain, and Brazil.

Events, 1945. President José María Velasco Ibarra opened the year with a plea for the termination of partisan strife. He lamented his lack of authority "to participate in the legislative function," reviewed the work of his administration during the past seven months despite "disquietude," and declared that increased food production and effective checks on the rising cost of living were the main tasks facing the republic.

The Constituent Assembly, still in session in the early weeks of 1945, was the cause of the President's plea. The Communists, aided by some Socialists, were in effective control of the assembly. By their insistence on passing controversial resolutions, including a bitterly debated press code, which frequently led to disorderly demonstrations and kept the country generally stirred up, the President believed that they were hampering his efforts to solve the country's urgent problems. The quarrel between President and assembly put a heavy strain on the ill-matched coalition of democratic parties which had put Velasco in power in 1944, and late in January it split completely.

Velasco announced that he had accepted the resignations of the Communist Minister of Public Instruction, Alfredo Vera y Vera, and the Socialist Minister of Social Security and Welfare, Alfonso Calderón. Vera and Calderón declared that they had not resigned but had been forced out, and on Jan. 31 the Socialist and Communist Parties announced that they would no longer share "the political and administrative responsibilities of the Government." Velasco filled the Cabinet vacancies with Liberal-Radicals.

The struggle approached a climax on Feb. 8, when Velasco told the Constituent Assembly that he would be forced to resign unless it amended certain provisions it had written into the constitution. A couple of days later, however, he said that he would go on "fighting to the last." De-

fense Minister Carlos Mancheno asserted that the Army would maintain the President in power, and on Feb. 12 the assembly removed from the projected constitution most of the press and radio restrictions which had caused nation-wide adverse comment. There was an immediate easing of tension, and the President seemed to have won an important victory, as leaders of the assembly agreed to make further concessions.

The new Constitution, on which the Constituent Assembly had worked for seven months, and which contained 180 articles, was formally promulgated in an assembly session on Mar. 6. The President had signed the document the day before but had stated publicly: "I signed it against my personal convictions and only to save the country from evil times." And he refused to take a ceremonious oath to the constitution, on the basis that all Ecuadorans were equally bound by it.

The 1945 constitution introduced several important changes in the legislative branch of the Government. It did away with the old bi-cameral legislature and established a unicameral one, made up of members elected directly for a two-year term. Another innovation provided for "functional" as well as elected legislators, to represent special business and professional groups. A Permanent Legislative Committee was created to draft laws and decrees, codify laws, supply information on bills submitted by the President, and pass necessary economic decree-laws when Congress is not in session. Four entirely new and extensive sections of the Constitution were devoted to social, cultural and economic rights and guarantees. To insure full compliance with the constitution and laws pertaining especially to constitutional guarantees, a Tribunal of Constitutional Guarantees, with jurisdiction in all the republic, was established. It was to be composed of three deputies elected by Congress, the Chief Justice of the Supreme Court, a representative of the President, the Attorney General, a representative of the workers, and two citizens elected by Congress.

There was more political excitement on Mar. 9 when the Minister of Government told the assembly that refusal or grant of an amnesty to members of the former regime of Carlos Arroyo del Río would not affect political conditions in the country. The speech touched off a dispute during which shots were fired in the assembly chamber, and members were not able to leave the hall because an excited crowd had gathered outside. The assembly finally granted the President power to give amnesty or pardon to political prisoners or exiles who had no major responsibility for the acts of the Arroyo del Río Administration. After a stormy session lasting through most of Mar. 10, the assembly adjourned early in the morning of Mar. 11.

During the summer there were repercussions in Ecuador as well as Cuba to the rice-sugar barter deal between the two countries. Eduardo Laso, Ecuadoran Minister of National Economy, resigned as a congressional investigating committee held him and his Under Secretary, A. Ortiz responsible for Ecuador's alleged loss of some \$700,000 on the transaction. In a letter to the President, Laso blamed his downfall on merchants who had been "defrauded in their exaggerated ambitions." When a court ordered the arrest of Laso on July 7, Velasco denounced the move as "an incident in a vast demagogic conspiracy to overthrow the Government." Laso was released on July 9, but Ortiz and at least one other official were arrested. The arrests were later invalidated by the Supreme Court. There was also

a controversy over a \$6,500,000 loan made by the Central Bank of Ecuador to the Government to be used for public works. Labor objected to the loan, and the representative of the Confederation of Ecuadoran Workers on the bank's board resigned in protest.

On July 13 Velasco struck back at his extremist enemies. "Leftism, socialism and communism are words for the exploitation of the workers," he declared in a radio address. "Ecuadoran leftism is headed toward failure," he predicted, adding that "speculators, agitators, demagogues, rightists and retired militarists are scheming to trap me into dictatorship." The causes of the unrest which Velasco thus recognized openly were largely economic; chiefly, spiraling food prices; but the President still seemed to have the support of most of the country.

Commander Washington Zabala, retired navy officer, was jailed in Quito on July 24 on charges of conspiring to overthrow the Government.

A year-old personal feud between the conservative Foreign Minister, Camilo Ponce Enriquez, and the leftist Interior Minister, Carlos Guevara Moreno, erupted in a Cabinet crisis late in July. The net result was the elimination of Ponce and the conservative Finance Minister, Mariano Suárez VENTIMILLA from the Government. The crisis began when Guevara refused to join the other Ministers in a vote of confidence in Ponce after his return from the UNCIO at San Francisco, where he headed the Ecuadoran delegation. Ponce thereupon criticized Velasco for keeping Guevara in the Cabinet, assailed the conduct of foreign relations during his absence, and resigned. The rest of the Cabinet went out with him. Velasco settled the dispute by appointing Juan Vicente Trujillo, Ambassador to Brazil, as Foreign Minister and Enrique Arizaga as Finance Minister, and rejecting the resignations of the other Ministers.

On the heels of this dispute came reports of a clash between police and an army battalion stationed in remote Loja. Former President Alberto Enriquez and other retired officers were arrested. There were no further developments.

A general amnesty for all political prisoners and exiles, including members and supporters of the deposed Arroyo del Río regime, was promulgated on Aug. 16. Arroyo del Río, in Colombia, said that he did not plan to return to Ecuador in the near future because of prevailing sentiment there against him.

On Aug. 27, representatives of the Communist, Socialist and Socialist Revolutionary Vanguard Parties met to prepare a base "for the unification of leftist groups," in preparation for forthcoming municipal elections. They reached a basic agreement on joint candidates on Sept. 3.

The police force and mechanized army units were called out late on Nov. 4 when angry citizens of Quito demonstrated against last-minute postponement of municipal elections by the National Election Board which claimed that its organization and supplies were not ready.

The elections were finally held on Nov. 25 and resulted in sweeping Conservative victories. The Conservatives won an eight to three majority in the voting for a municipal council in Quito, and the Conservative leader, Jacinto Jijón y Caamaño was chosen mayor. The real battle was between Conservatives and Socialists. The middle-of-the-road Liberal-Radicals failed to poll as much as ten percent of the Conservative vote. The immediate effect of the upset was a change in the attitude of the

Socialists, who reorganized their party and began moving toward a coalition with the Liberal-Radicals and other center elements. The Rightist victory also swung Conservative support toward Velasco; the Conservatives apparently reasoned that their best chance of continuing to gain lay in the maintenance of a stable constitutional order.

The Leftist defeat in the municipal elections seemed also to have an effect on a special session of Congress called in December to consider such international matters as the United Nations Charter and the Bretton Woods Agreements. Velasco supporters had feared that it might get out of hand, but it confined itself strictly to the agenda and adjourned smoothly.

Echoes of the old days of dollar diplomacy were heard in Quito in December. The Ecuadoran Government charged that the Ambursen Engineering Corp. of New York had tried to finance a revolution. Spencer W. Stewart, secretary and Quito representative of Ambursen, was ordered to leave the country and the company's operations were shut down.

According to the Government, the company was unable to complete a highway between Quevedo and Manta, on which it had already spent 28,000,000 sucres (about \$1,960,000) of Export-Import Bank funds. So it offered to put up \$80,000 to overthrow the Government and tried to persuade other United States firms to join it. One of them revealed the plot.

Other Foreign Relations. On authorization of the Constituent Assembly, the Foreign Ministry on Feb. 2 informed the other American republics that Ecuador regarded itself as having been at war with Japan since Dec. 7, 1941.

On Mar. 31 British Foreign Secretary Anthony Eden told the press that the United Kingdom "considers that it has the right to ask that a date be fixed on which the Ecuadoran Government will take the necessary steps with reference to her external debt." Some \$16,000,000 in Ecuadoran foreign bonds had been in default since 1929.

Final completion of the Ecuadoran-Peruvian frontier settlement was formally observed on July 14 in Rio de Janeiro.

HARRY B. MURKLAND.

EDUCATION. The most conspicuous developments in American education during the year 1945 were at the higher levels, in the colleges and universities and in the field of scientific research. This is not to say that the lower schools were unaffected by the new interest which the whole population of the country has taken in international and national social and economic problems. Teachers in high schools and elementary schools have turned the attention of their pupils more than they ever did before to the nations of the world, especially to those of South America and to Russia and China. The subject of geography has expanded to include instruction with regard to parts of the world which were formerly passed over lightly, such as the Orient and the Pacific. New kinds of maps are in use supplementing the familiar Mercator projection maps. Pupils in the grades as low as the fifth and sixth have acquired an acquaintance with the technical facts of aviation. Their knowledge about airplanes has been supplied in some measure through magazines and newspapers and in some measure through the nation-wide campaign carried on by Air-Age Education Research, an agency which is fostered and maintained by the American Airlines, Inc.

It is in the colleges and universities, however,

that steps are being taken of such a radical character and in such numbers as to constitute a veritable revolution. Some of these steps are easily explained as directly due to the highly successful educational programs of the Army and Navy. Some were tentatively advocated before the war but have rapidly reached the stage of effective consummation now that institutions of higher education are once more filling up with students after four years during which enrolments had shrunk to the point that threatened the continued existence of many institutions.

Under the title "A Survey Reveals Army and Navy Influence on the Nation's College Programs" the *New York Times* reported the changes which are being made in twenty-one "representative institutions of higher learning in various parts of the country." Some paragraphs from the report of this survey may be quoted.

Among the most important of the changes brought into the classroom by the Army and Navy, the survey discloses, are these: (1) Modified way of teaching foreign languages; (2) increased use of visual aids; (3) more emphasis upon science and technical subjects; (4) greater stress on physical education; (5) greater flexibility in the use of faculty members in subjects outside their own field of specialization.

There are numerous other changes and modifications, of course. Some institutions, for example, are revising their lecture system as a result of the work done by the Army with small group discussions. Others report that they have added special courses, to be a permanent part of the curriculum.

Of the major wartime changes, perhaps that in the teaching of foreign languages is the most striking. Although subject to considerable criticism as well as praise, the Army method of teaching languages has, with variations, been accepted by almost all of the institutions polled.

Typical of what is noted elsewhere is the program at Yale University. Here all beginning courses in modern languages are now being taught by the intensive method similar to that used in the Army training programs. Under this method, ten hours weekly are devoted to classes in the language selected by the student, eight hours confined to oral practice.

Recording machines, used extensively at Yale in the teaching of Chinese to trainees in the Army Military Intelligence School, have been found to be so effective that other language departments—German, Spanish, French and Russian—are considering using them. The far-reaching consequences of the use of these machines can be measured when it is revealed that seven instructors, known as "informants," with the mechanical devices, now train 150 men, whereas thirteen teachers, without machines, were formerly required to instruct thirty men.

At another institution somewhat distant from Yale—the University of Nebraska—the language program has likewise been modified as a result of Army experience. The traditional lecture-reading system has been revised to include two-hour laboratory periods in which students hear the spoken language; sound films and recordings have been introduced to supplement classroom instruction.

Further evidence of the impression produced by the success of the armed forces in their conduct of instruction is to be seen in the fact that a commission has been organized to make a two-year study of what colleges and schools can learn from the experiences of the Army and Navy. The Carnegie Corporation and the General Education Board have provided a fund of \$150,000 for the study. Alonzo G. Grace, Commissioner of Education of the state of Connecticut, with a staff of educators and laymen will examine the curriculums and methods of teaching which have been employed and attempt to discover what phases of the program of the armed forces should be adopted in civilian institutions.

During the war more than ten million men and women were trained by the Army and Navy in a great variety of lines. Many of those who were thus trained had earlier attended high schools and colleges. These former students in educational institutions found that the most striking characteristics

of the training given by the armed forces were its definiteness and concreteness. Visual instruction, the use of films and charts, was carried far beyond anything heretofore attempted in any branch of the educational system. Visual instruction has demonstrated to the soldiers and sailors the value of this supplement to verbal training. Of course, the military forces had resources which the ordinary educational institution did not command for the production of concrete visual materials. From the point of view of instructional technique it can be said that the war made possible demonstration on an unprecedented scale of the importance of such materials. The schools will perhaps be able to secure the resources to take advantage in times of peace of the demonstration which has thus been given.

Quite apart from the example of the Army and Navy are certain forces and tendencies which have been operating in higher education for a long time and are now taking effective form in new plans and practices for the reorganization of both the contents and the methods of college teaching. College faculties have in a number of cases issued elaborate reports. Some of these are based on investigations which began before the war but are now resulting in more or less complete reorganizations of college education. It is, of course, impossible in a limited discussion to review all, or even any considerable number, of these reports. The best that can be done is to center on one of the most important and make the account of this one report the vehicle for generalizations which issue from the whole collection.

Harvard University has published in a book of 267 pages entitled *General Education in a Free Society* an elaborate statement of the present trends in education and recommendations for the reorganization of Harvard College. Most of the recommendations have already been adopted by the faculty.

The first generalization is clearly indicated in the title of the Harvard report. General education appropriate to the present-day world is the kind of education toward which, in one way or another, all the college reports point. The kind of higher educational program which originated in Europe when the nations emerging from the Dark Ages looked to the example of Greece and Rome to save them from barbarism is now recognized as outmoded. The day of the classical curriculum is gone. Even Harvard is willing to have the study of ancient languages take second or third place. In fact, the Harvard report frankly states that the chief justification of any study of a classical language is for the purpose of equipping the student to understand and properly employ his vernacular. The term "liberal education" is deliberately abandoned because of its ambiguity and historical implications. The term "general education" is regarded as defining more adequately what is aimed at. General education includes as an important two-thirds of its contents natural and social sciences. The other third is, indeed, to be devoted to literary subjects, but among these English is far and away the dominant section.

The second generalization is that the free elective system is now recognized as deficient in that it does not guarantee to educated individuals any common body of experience, which is essential to the creation of a unified society of like-minded citizens. Harvard is called upon by its reporting committee to devote six of the sixteen units required for graduation to a group of courses which every student will be required to take. These re-

quired courses are in the three general fields mentioned in the preceding paragraph, namely natural science, social science, and humanities. It is recommended that two of the six required courses be taken in the first year and at least one more in the sophomore year. Beyond the six required courses there is some latitude of choice, but even in the fields of specialization allowed to individual students far more work is explicitly prescribed than was required in the days of the free elective system.

The devotion of the first two years of college to broad general education is, of course, no new plan. The University of Chicago has led the way by awarding the degree which stands for general education at the end of the second year. Yale has long had its freshman faculty and special freshman program. Most of the institutions of higher education employ the last two years for specialization in contrast with the first two years of general education. The remarkable fact is that the trend has now become so definite that it is accepted by Harvard, the original home of the extreme elective plan of education.

The third generalization, which follows naturally from the second, is that the college recognizes its very close connection with the secondary school as a copartner in general education. The reader of the Harvard report is impressed by the introductory chapter of the report, which recounts the growth of the free public high school. The material in this chapter is not new, but it shows that a broad general education is no longer to be thought of as the exclusive privilege of a small selected group.

The reader of the Harvard report is also impressed by the fact that the longest and by all odds the most penetrating discussion of the curriculum of general education is the sixty-page description of the courses which the Harvard committee regards as the appropriate fields of instruction for the secondary schools. These fields of secondary education are described in such detail that, when it comes to a description of the proposed required college courses in the same fields, it has seemed to the committee undesirable to give more than the barest outline of the college courses.

It can be shown that this tendency to recognize secondary education as part of the emerging plan of general education is accepted by institutions other than Harvard by referring to the Yale program. At Yale students who have completed in secondary schools some of the studies that are required are excused from repeating them in college. The dean of Yale expresses an ardent desire for the cultivation of closer relations between his institution and the secondary schools.

The University of Chicago has gone further than the conservative New England institutions. Chicago has acted on its conviction that the secondary school can and does lay the broad foundation of general education. Secondary schools and the first two years of college have been completely integrated.

The fourth generalization, one that is confirmed by the Yale plan and other well-known programs which are subjects of wide discussion, is that independent reading of the major writings of all ages is an indispensable part of general education. Harvard is going to have a course in "Great Books." Yale is going to require its students to read assigned books during the summer vacation and stand examination on the readings in the fall. The University of Chicago and St. John's College have for some years led the movement for such a course in the college curriculum.

There are other generalizations that issue from

a reading of the reports from Harvard, Yale, and a large number of other institutions of higher education, but some of these can better be discussed apart from the reforms which are being made in college programs. These additional generalizations relate to the sciences and their place in American education.

Apparently final determination of the status of science in educational institutions will come from Congress. That body now has before it a number of bills which, if passed, will be influential in promoting the study of the sciences. Senator Thomas of Utah is sponsor for a bill which declares that there is a "widespread lack of opportunity for youth enrolled in public secondary schools to receive effective instruction in natural science subjects." The bill proposes the appropriation of sums beginning with \$4,000,000 in 1945 and rising to \$20,000,000 in 1951 to help states pay the salaries of supervisors and teachers of natural sciences and the cost of supplies and equipment.

A more general attack on the whole problem was proposed some years ago by Senator Kilgore. He introduced a bill which in its revised form is now before Congress. This bill provides for the establishment of a federal foundation to distribute money in the postwar period to universities and other non-profit agencies to encourage scientific research related to national defense, health, housing, consumer problems, and other areas of public interest.

The main concern of Congress at the present time centers on bills which have been introduced in response to an elaborate report entitled *Science, the Endless Frontier*. This report was prepared at the request of President Roosevelt by Dr. Vannevar Bush, director of the Office of Scientific Research and Development. The agency of which Dr. Bush is director had charge during the war of organizing various scientific research projects.

Dr. Bush's report advocates a large annual federal appropriation to be administered by a federal foundation in promoting research in the natural sciences. It also recommends 6,000 four-year scholarships for candidates for the bachelor's degree and 300 three-year fellowships for candidates for the doctor's degree.

The chief emphasis in the bills proposing subsidies is on the natural sciences. The social sciences are, however, not overlooked. Medical research with its bearing on human welfare is frequently mentioned as a subject in which the federal foundation should interest itself. Consumer education and housing are also commonly included when fields of research are described.

Social science is, however, not recognized as equally urgent with natural science although it is included among required courses in educational institutions more generally than formerly. Whether encouragement to students in the form of scholarships and fellowships in the social sciences will in due time be forthcoming remains to be seen. All that can be said at present is that attention to human interests is steadily gaining ground. It is difficult to believe that the race for technological achievement can long outrun attainment of social adjustments based on fundamental research.

An educational program of a wholly different character from those discussed up to this point is before Congress and has aroused vigorous discussion throughout the nation. This is a program for one year of compulsory military training of all youth between the ages of eighteen and twenty-two. President Roosevelt recommended such a period of compulsory training. President Truman

has urged its adoption. Military leaders say that it is essential to the safety of the United States. On the other hand, educators are for the most part opposed, and widespread uncertainty exists as to the wisdom of such a program. It is often said that military necessity does not call for such action. Above all, it is urged that the Army is not the proper agency for the administration of a program of training of youth.

Various compromise measures have been suggested which would emphasize more than a law providing for compulsory military training the desirability of demanding of youth a year of devotion to public service.

Neither the military authorities nor those who are opposed to their demands for a year of compulsory military training have ever given a clear account of just what they would do with youth during a year if they were entrusted with the administration of the program. The question is fundamentally one of skepticism with regard to the ability of either educators or military leaders to render acceptable service to the nation in the upbringing of youth.

While the United States is engaged in finding solutions for its domestic educational problems it is confronted with the necessity of taking some kind of action with respect to education in other countries. Certain negative policies in the conquered countries of the Axis have been definitely adopted. It has been decided that references to Fascism in Italian textbooks must be eliminated. So must also Nazi doctrines from German textbooks. General MacArthur has issued an edict that Shintoism is no longer to have the support of the Japanese government. This edict requires a revision of the official instruction which up to the end of the war was administered to all Japanese pupils.

It is the positive hope of Americans that the conquered nations will insert in place of the deleted teachings some kind of materials which will stimulate interest in, and final acceptance of, democracy. The negative side of the educational program is easier to enforce than the positive side. Even if some success in cutting out undesirable reading materials is achieved, the problems of retraining teachers remain and will require time and wisdom for their solution.

In the meantime, England and France have recently announced greatly extended programs of advanced education for adolescents. These moves show that the impact of the war has tended to break down the class system, which has heretofore largely kept the doors of the upper schools closed to the sons and daughters of the common people.

One of the most hopeful achievements in the field of education is the establishment by representatives of the United Nations of an organization which is to function as an international office of education.

When the San Francisco conference assembled, there was no provision in the agenda for consideration of world education. By the exercise of all the influence which educators could bring to bear on that conference success was finally achieved in having inserted in the Charter provision for a branch of the United Nations Organization to deal with education and cultural relations.

During the past three years several unofficial conferences have been held in this country of representatives of a number of nations who joined in promoting a plan for some kind of international educational organization. A conference was held in London during the summer of 1945 of ministers of education from some of the leading nations with a

similar purpose. This conference drafted a proposal looking to the organization of an international office of education.

Finally, on Nov. 1, 1945, a formal government-sponsored assembly of delegates from forty-four nations opened its sessions in London with the purpose of drafting a charter to be submitted to the United Nations.

Prime Minister Attlee, in his opening address to the delegates, stressed the contributions which an international educational assembly can make to world understanding and world peace. Miss Ellen Wilkinson, British Minister of Education, was elected president; M. Blum, the chief of the French delegation, was elected associate president, as was also Archibald MacLeish, head of the delegation from the United States. Russia was not represented.

The first sessions were devoted to reports from delegates of the various countries. The educational conditions in the countries overrun during the war are deplorable in the extreme. One of the early functions of the new educational organization will be to render such aid as is possible in restoring school buildings and equipment.

On Nov. 15, without a dissenting vote, a constitution drafted by a committee headed by Archibald MacLeish of the United States was accepted. It will be submitted to the members of the United Nations and will be in effect when adopted by twenty of the nations.

The new organization will be made up of a General Conference, an Executive Board, and a Secretariat. Each country is to have five delegates to the Conference and one vote. The Executive Board will consist of eighteen members. The Secretariat will have a director general and a staff.

To preserve the independence of the nations the educational body is prohibited from intervening in matters "which are essentially within their domestic jurisdiction."

In its preamble the constitution warns that the peace will fail unless it is founded upon the "intellectual and moral solidarity of mankind." The member nations promise in the Charter to increase the means of communication between their peoples and to employ these means for the purposes of mutual understanding and "a truer and more perfect knowledge of each other's lives."

"The purpose of the organization is to contribute to peace and security by promoting collaboration among the nations through education, science and culture in order to further universal respect for justice, for the rule of law and for the human rights and fundamental freedoms which are affirmed for the peoples of the world without distinction of race, sex, language or religion by the Charter of the United Nations."

Each member nation will be required to report periodically to the organization on its laws, regulations, and statistics relating to educational, scientific, and cultural life and institutions.

An Interim Commission was created and is continuing in session in London. This consists of a representative of each of the United Nations that signed the Charter. An Executive Committee of fifteen members of the Interim Commission is to be appointed to prepare the agenda for the first session of the General Conference, scheduled tentatively for early next fall in Paris.

A resolution, introduced by France and seconded by Yugoslavia, called upon the conference to send all documents relating to its work to members of the United Nations who were not at the sessions. The delegates are hopeful that the Soviet government will join the Interim Commission.

The use of the press, radio, and motion pictures for the spread of knowledge and mutual understanding among the peoples of the world was recommended in a clause adopted by the conference on motion of the United States. Another amendment fostered by the United States asked for close working relationships with adult-education agencies.

CHARLES H. JUDD.

EDUCATION, U. S. Office of. During 1945 the U. S. Office of Education sought in many way to provide effective leadership and assistance to the schools and colleges.

General Services. The Office cooperated with other governmental agencies in a variety of special war services including the development of plans for keeping youth in school; provision of school services in war areas under the Lanham Act; maintenance of essential school transportation; utilization and disposal of surplus property for educational use; participation of schools in the salvage drive; making available to schools operating supplies, textbooks, and essential maintenance materials upon which wartime restrictions had been placed; school lunches; programs of health and physical education; and the development of a sound approach in the field of social hygiene.

Consideration was given to the adaptation of school programs and services. Special attention was paid to programs for exceptional children, Negroes, Spanish-speaking groups, children of migrants, and rural youth; reorganization of administrative units and school programs to meet postwar needs; promotion of interest in school progress through civic and club discussion groups; nutritional problems on the elementary school level, and improving the dental health of high school pupils. Studies were made of school building needs, expenditures for education, wartime legislation affecting education, child accounting and compulsory school attendance, use of cumulative records, juvenile delinquency and the schools, visiting teacher work, certification of school social workers, motivation in health education, supplying textbooks and other instructional materials at public expense, pupil personnel services, and recreation services for children and youth.

The basic statistical data concerning education in the United States continued to be collected and compiled by the U. S. Office of Education during 1945, together with special studies undertaken to meet requests from other Government agencies and the general public. Data included studies of the effect of the war on school enrollments, on land-grant colleges, on college income and expenditures, and on expenditures per pupil in city-school systems. (See SCHOOLS; UNIVERSITIES.)

Elementary Education. Elementary education activities were centered on instructional problems, frequently through conferences, workshops, or committee group effort. Bibliographies of courses of study and a guide to developing a unit of work were prepared. Special attention was given to broadening the school curriculum, such as nutrition education, for which a cooperative follow-up report was issued; fire safety, which involved a working conference and the preparation of a curriculum guide; conservation education; teaching about Latin America; and intercultural education. Cooperation with the informal organization of State elementary school supervisors, begun several years ago, was actively continued.

Wartime concern for the school care of children below school age increased the number of inquiries

with respect to legislation, and to initiating, organizing, equipping, and safeguarding standards for nursery schools and kindergartens. Materials in this field, including a study of schools for children under six, were prepared.

The Office continued to promote nursery schools and school-age centers for children of working mothers. At the same time resources were available to assist State departments and local schools in incorporating these services, including parent education, into the school framework.

The work for exceptional children has been marked by cooperative projects. Upon request of Georgia authorities the Office had an active part in making a survey of the Georgia School for the Deaf. In cooperation with the National Association of Training Schools, a study was issued of educational programs in training schools for delinquent youth. In cooperation with a group of curriculum and guidance specialists a study was completed of curriculum adjustments for gifted and talented children. At the request of the representative for China on the UNRRA Council, recommendations were submitted for centers for handicapped children in China.

The Office has attempted in a variety of ways over the past several years to secure joint planning by educators and social workers, to the end that school children in trouble will secure the special assistance they need. The past year has seen encouraging developments in this line through a working conference called by the Office of national leaders in education and in social work, and subsequent reports and studies of visiting teacher services. Efforts were continued also in the field of school recreation.

Secondary Education. Activities in secondary education were concerned largely with problems related to wartime conditions. As some of these problems were in the fields of interest of other Government agencies, a few joint studies were undertaken. The Children's Bureau and the Office of Education jointly sponsored a nation-wide Back-to-School Drive, in an attempt to stem the tide of rapidly decreasing high school enrollments and rapidly increasing employment of youth fourteen through seventeen years of age. Factual information and suggestions for action programs by schools and employer and employee-organizations were prepared and widely distributed. Also in cooperation with the Children's Bureau was undertaken a study of school-work programs, other than vocational, designed to give students opportunities for part-time work along with school attendance. It is the purpose of the study to ascertain desirable and successful features of such programs, together with other facts valuable for guidance in similar future arrangements. About a dozen school systems were visited for detailed study, and from approximately 300, information was secured by correspondence. A report is in preparation.

The Office took the initiative in calling meetings of Federal agencies whose programs relate to the health of school-age children. At these meetings information was exchanged, needs studied, and recommendations for cooperation formulated. As a result, a report was produced on child health. During the year an Inter-Agency Coordinating Committee was created to formulate policies and coordinate existing programs in health and physical fitness.

In recognition of the need for expanded school services for youth of secondary school age and the years immediately following, the Office prepared a mimeographed document which attempted ten-

tatively, to (1) identify major problems involved, (2) present illustrative questions and data, and (3) propose some principles for action. This was sent to selected leaders in secondary education to promote general discussion and also to elicit suggestions for the improvement of the document, which is now being revised for publication.

A study of State plans for granting high school credit for study and experience outside of school was initiated. Such plans involve (1) examinations and (2) evaluations of work programs and study courses pursued. Also under way is a study of the value of certain tests, developed by the War Department, for guidance in secondary education. Selected tests have been given in five school systems and an analysis is being made of the prognostic value of each test for various high school subjects.

Higher Education. The Division of Higher Education compiled and published a bulletin under the title *Higher Education Looks Ahead* containing accounts of important changes made in colleges and universities in their efforts to adjust to the post-war demands of veterans, returning war workers, and regular high school graduates; through correspondence and interviews, counseled veterans and returning war workers concerning colleges and universities best adapted to their needs; conferred with veterans and former war workers concerning postwar jobs; supplied the Veterans Administration, War Department, Navy Department, and other government agencies with information concerning colleges and universities; participated in developing plans for making surplus war property available to colleges and universities at price discounts; terminated the Engineering, Science, and Management War Training Program as of June 30, 1945, secured the final reports from the more than 200 participating colleges and universities, and carried out a program of liquidating the program in cooperation with the General Accounting Office; continued collections on the loans to approximately 10,000 students who had been recipients of Student War Loans; cooperated with the Statistical Division in securing current information concerning enrollments, income, and expenditures in the 1,700 colleges and universities; published five bulletins, (1) *Data for State-wide Planning of Veterans' Education*, (2) *Educational Directory of Colleges and Universities*, (3) *Accredited Higher Institutions, 1944*, (4) *Offerings in the Fields of Guidance and Personnel Work in Colleges and Universities*, and (5) *Higher Education Looks Ahead*; prepared a manuscript for publication under the title, *Vocational Education of College Grade*, which carries a description of important less-than-degree level vocational curricula maintained by colleges and universities; administered the \$5,030,000 supplementary Morrill funds, and began a study in cooperation with the Association of Land-Grant Colleges and Universities of short intensive curricula maintained at the 69 land-grant colleges and universities; participated in surveys of higher education in Mississippi and South Carolina; published semi-monthly the 12-page periodical *Higher Education*; and participated in increasing numbers of conferences and handled increasing flow of correspondence dealing with questions in the field of higher education.

International Educational Relations. The Division of International Educational Relations was organized in the U.S. Office of Education during 1945, combining the staffs and the functions in the field of comparative education and inter-American educational relations.

Work during the year included field trips of educational specialists to make basic studies of systems in Latin America; administration of fellowships and professorships under the Buenos Aires Convention; arranging intern training for teachers and students from the other American Republics, China, Philippine Islands, Afghanistan and India; recommending U.S. teachers for employment in Central and South America and the Near East; promotion of the study of Spanish, Portuguese and English; preparation and exchange of materials on education; promoting better understanding in the U.S. of the peoples of the Far East through conferences, lectures, and the preparation of curriculum materials for use by teachers; supplying information on education abroad to students of comparative education and others; supplying teaching materials on Latin America including loan packets, exhibits, kodachrome slides and free publications; assistance to teacher education institutions and inter-American demonstration centers to aid in introducing improved materials and teaching techniques; and provision of consultants and speakers for workshops, institutes and conferences throughout the United States.

Vocational Education. The Vocational Division of the U.S. Office of Education administered the provisions of the Smith-Hughes and George-Deen Acts for the promotion of vocational education in the States in the fields of agriculture, trades and industry, home economics, distributive occupations, and occupational information and guidance for which funds are allotted to the States on a matching basis by Congressional appropriation.

In addition to its regular services, the Vocational Agriculture Service maintained cooperation with State Boards for Vocational Education in administration of the Food Production War Training Program. More than 4,188,450 enrollments were reported in shop, farm machinery repair, labor training, food production, and food processing courses. The program, discontinued May 31, 1945, was followed by the Special-Grant Food Processing Program completed Dec. 31, 1945, in which approximately 550,000 persons were enrolled.

The Vocational Home Economics Service promoted the federally-aided program in the States. Special emphasis was given toward assisting States in making curriculum adjustments for war and post-war periods, in community organization for home and family life education, and for expanding home-making education programs for adults. Attention was given through conferences and field service to programs in nutrition, food production and conservation, school lunches, improvement of family health, and consumer education.

The Trade and Industrial Education Service further assisted States in promotion and development of trade preparatory programs for youth, part-time trade extension classes, evening industrial classes for employed men and women, and supervisory training. This Service also cooperated with the States in the operation of the Vocational Training for War Production Workers Program.

The Business Education Service assisted the States in the promotion and development of the federally-aided program of distributive education, including programs of training designed to help retail business executives and managers meet shortages of trained and experienced store workers. Attention was given to assisting States to organize and administer pre-employment replacement training programs, wartime training programs for experienced distributive workers, and supervisory training for store managerial personnel.

The Occupational Information and Guidance Service gave assistance in solving problems involving these factors, met requests for field service from the States, and provided guidance service for returning veterans and dislocated war workers. Assistance was given in the development of counselor training and the organization of community adult counseling service; also to governmental and civilian agencies in formulating policies relating to occupational information and guidance.

War Production Training Programs. The Vocational Division terminated the Vocational Training for War Production Workers Program and the Food Production War Training Program, conducted in cooperation with State boards for vocational education. The war production training programs began in 1940, under administration of the Trade and Industrial and the Agricultural Education Services. During the five years of operation, net payments to the States for Vocational Training of War Production Workers approximated \$298,266,300; those for the Food Production Program, approximated \$49,029,200. The Federal funds allotted were for cost of courses and acquisition of equipment.

The Vocational Training for War Production Workers Program began July 1, 1940. Existing vocational training facilities in public schools were used to train workers for war industries. As training needs increased, additional facilities were provided from Federal funds.

With the closing of all courses on June 30, 1945, this program came to an end. From the beginning of the program, July 1, 1940, through the closing date, June 30, 1945, there were 7,469,506 enrollments in both the pre-employment and supplementary courses. Of this total, 2,667,449 were in the pre-employment program which terminated on May 31, 1945, and 4,802,057 enrollments in supplementary courses.

Women trainees in supplementary courses totalled 946,731 or 19.7 percent of those trained from the beginning of the program. Negro trainees totalled 157,471 or 3.3 percent of all persons enrolled. Since Jan. 1, 1944, 15,830 veterans of World War II were trained in supplementary courses.

The Food Production War Training Program began Oct. 9, 1940. Repair, operation, and construction of farm machinery and equipment; production, conservation, and processing of food for family use were some of the activities carried on in this program.

All courses in this program were officially terminated May 31, 1945. From the program's beginning through the closing date, 4,188,552 enrollments were reported, divided as follows: Food processing courses, 1,514,093; farm machinery courses, 1,215,939; shop courses, 820,058; food production courses, 534,138; and training farm workers courses, 104,324.

Almost one-third of all enrollments reported since the beginning of the program were women, a total of 1,366,570. Negro enrollments reported were 771,203 or 18.4 percent of the total; 402,114 enrollments were from urban communities (2,500 population or over), or 9.6 percent of the total; and 85,235 were in-school enrollments, or 2.0 percent of the total.

A special work grant of Federal funds, of which approximately \$1,587,900 was sent to the States, provided for the continuation beyond June 30, 1945, of the food processing courses carried on in the Food Production Program. On the basis of data received for the first four months of the program

it is estimated that 550,000 enrolled in the courses. This program began on July 1, 1945, and terminated Dec. 31, 1945.

School Administration. Services relating to the war were rendered throughout the year, school transportation and school facilities for pupils in areas affected by war activities receiving major attention. Cooperation with State departments of education and educational institutions, in anticipation of the disposal of surplus war property which schools could use, was also given.

State and national legislative activity was particularly heavy during the year, resulting in many queries to the Office on pending legislation. Requests were also received for the preparation of articles for educational and law journals relating to the important features of satisfactory school codes and plans for school administrative organization, buildings, finance, and transportation.

Staff members participated in such committee work as that of developing school furniture types and standards, formulating proposals for the utilization of surplus war property for schools, and outlining problems for study by the National Council of Chief State School Officers. Members of the staff also directed or participated in many conferences throughout the country on school administration. Such conferences took place in Washington, D. C.; Lafayette, Ind.; Baltimore, Md.; New York, N. Y.; Philadelphia, Pa.; Nashville, Tenn.; Williamsburg, Va.; Birmingham, Ala.; Sacramento, Calif.; Denver, Colo.; Atlanta, Ga.; Boston, Mass.; St. Louis, Mo.; and St. Paul, Minn.

Studies relating to school administration which were completed and published during the year are *Leaflet No. 76, Federal Government expenditures for education, 1943-44*; *Good Reference Bibliography No. 75, School finance*; and *Good Reference Bibliography No. 76, The local board of education*. Among those in progress, but not completed during the year are *State plans for financing education*; *Legal provisions affecting the international exchange of teachers*; *Summary of legislation affecting education* enacted by the 79th Congress, First session; *Codification and improvement of State laws relating to education*; *Planning the school plant*; and *A study of pupil transportation* covering State and local responsibility, legal basis, financing, records and reports, selection and training of school bus drivers, standards, ownership, insurance, bus maintenance, and purchasing procedures for bus equipment and supplies.

An important service was the correspondence and personal interviews with State and local school officials, representatives of Federal Government agencies, and various officials of national and State associations. Such service includes the furnishing of information on every phase of school administration.

Auxiliary Services. The Division of Visual Aids for War Training, according to Congressional directions, completed the visual aids production program and continued the distribution of these visual units to schools and industry.

The total production program consisted of 457 sound motion pictures, 432 silent filmstrips accompanying individual motion pictures, and 457 instructor's manuals; 632 of these films and filmstrips were completed during the fiscal year ending June 30, 1945.

Subject areas covered by series of visual aids units include machine shop, aircraft, shipbuilding, precision wood machining, engineering, electrical problems in supervision, nursing, foundry practice, refrigeration service, farm work, welding proce-

dures, plastics, optical craftsmanship, and automotive operation and maintenance.

Services to Libraries. The Libraries Section concerned itself with the development of adequate public, school, college, university, and special library services under wartime conditions. Among its activities were consultative services to State agencies on the planning of library programs, on in-service training institutes for librarians, and on the layout and equipment of school and other libraries. Through *Education for Victory*, bi-weekly periodical of the Office, the section kept libraries informed concerning significant wartime library projects and pertinent Government documents. It administered a nation-wide project of circulating exhibits of teaching materials on Latin America. The section also cooperated with other Federal agencies in their programs which required library facilities, and it generally made available the basic facts regarding the services, resources, and finances of all types of libraries.

Educational Uses of Radio. The Radio Unit was active in further stimulation of interest among school administrators and teachers in the frequencies reserved exclusively for non-commercial educational broadcasting. Requested information or advice ranged all the way from simply giving information as to where factual materials could be found, to the preparation of suggested plans for the organization of school radio broadcasts. Under joint sponsorship with the Office of Education, two FM Institutes were offered for the first time during the summer at the University of Wisconsin and at Ohio State University, for studying all the problems involved from the time an application for license is considered through the various stages of engineering, programming and utilization.

Approximately 170 new scripts were accepted during the year for circulation on free loan through the Script and Transcription Exchange. A revised catalog, listing nearly 1,100 scripts is in process of printing. Likewise, an additional 25 new transcriptions, dealing with timely postwar problems, have been added to the library for free circulation. During the year over 9,000 scripts and 2,891 transcriptions were circulated.

A new *Radio Bibliography*, published in October, 1945, lists some 300 books, pamphlets and periodicals of particular use to those interested in educational radio.

Services for the Blind. The Services for the Blind was created in the U. S. Office of Education following the passage of the Randolph-Sheppard Act. The Act was designed to improve the economic condition of blind persons, authorize them to operate vending stands in Federal and other buildings, and provide for the making of surveys of industries to obtain information that will assist blind persons to obtain employment.

There are now forty-four State agencies designated by the U.S. Commissioner of Education to issue licenses to blind persons to operate vending stands in Federal and other buildings. Three hundred and forty-two stands are in operation in Federal buildings throughout the country, fifty-four of which are in the District of Columbia. In addition to the stands in Federal buildings, there are approximately six hundred and twenty-five being operated in State, county, municipal and private buildings which have been established largely as a result of the impetus given by the Randolph-Sheppard Act. The vending stands outside of the District of Columbia have an average yearly net income of approximately \$1,650 and those in the District average more than \$3,200.

In addition the Services also assists States in making surveys of industries, and aids in the training of personnel in the techniques of placing blind persons. During the War it is estimated that over four thousand blind persons were employed in industries, and their production in most cases was equal to or beyond that of their sighted associates.

U. S. Office of Education Library. The activities of the Library continued to be war centered and directed toward serving its clientele of Education specialists, specialists in other government agencies, and persons carrying on research throughout the country. In addition to maintenance of adequate collections in the usual fields of interest, emphasis was placed on the acquisition of materials on postwar planning, education of returning veterans, war training programs, and other war related subjects.

Bibliographical services included the collection of data on theses, dissertations and research studies for eventual publication in the *Bibliography of Research Studies in Education*; preparation of bibliographies on *Planning for Postwar Education in the United States*, and *Compulsory Military Training*; preparation of annotated lists of new books and pamphlets for *Education for Victory*, and annotation of Office of Education publications for the Library of Congress bibliography, *Postwar Problems*. In addition more than fifty special lists of materials on various subjects were prepared in answer to requests from individuals and institutions.

Approximately 10,000 volumes were added during the year, increasing the number of items held to more than 320,000. The following statistics indicate the extent of the Library's services: attendance, 8200; books loaned to individuals for outside use, 9960; books used in the reading room, 26,100; requests for information by telephone, 7,100; books loaned to other libraries, 3,200.

Information and Publications. Mailing lists containing the names of educational institutions, associations, libraries, and administrative personnel concerned with education were used for the distribution of limited free supplies of publications, informational material such as news releases, and periodicals. These lists were also made available to other Government agencies for the distribution of material relating to education and the prosecution of the war effort.

Newspaper and magazine writers were furnished information on educational activities by the Information Service, which, as in 1944, cooperated with the Children's Bureau in a Back-to-School Drive to encourage high school youth employed in war industries to return to school.

The Graphics Unit designed publications, prepared displays and exhibits for conferences, and continued its service of supplying photographs from its files to educational periodicals and others.

Publications of the Office have grown from a single document—the Commissioner's *Annual Report* for 1867-68—for the first year, to numerous bulletins now issued each year, in many fields of educational endeavor. *The Biennial Survey*, published in textual and statistical volumes, has become a time-honored institution to students of education throughout the United States and in numerous other countries. Publication of *School Life*, the Office's official monthly periodical since World War I, was resumed with the October, 1945, issue. (During World War II a biweekly newspaper, *Education For Victory* had taken its place temporarily.) Since January, 1945, another periodical, *Higher Education*, has been issued twice a month especially for colleges and universities. An-

nually the Office publishes an *Educational Directory*. This is issued in four parts—I. Federal, State and County Education Officers; II. City School Officers; III. Colleges and Universities; IV. Educational Associations. The Annual Report of the U.S. Office of Education is also published after the close of each fiscal year.

Printed documents issued by the U. S. Office of Education are available from the Office as long as the limited free supply lasts. They are available by purchase at nominal cost from the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

Research and Statistical Service. The chief functions of the Service are to prepare basic statistical reports and to supplement the staff of the various divisions with technical assistance in special problems of research. The Service completed basic statistical chapters for the *Biennial Survey of Education* for 1941-42 and progressed with the compilation of reports for 1943-44. It began a re-study of the schedule of statistical reports. As one step in this direction the Commissioner called together a group of educators to meet with staff members of the Office in defining the statistical reporting and research functioning of the Office. In addition to special consultative assistance to school officials and representatives of various agencies, the service: prepared several articles and circulars reporting results of special statistical studies; studied problems of statistical reporting in connection with the Surplus Property Utilization program; and designed special studies for obtaining information on changes in educational activities of schools and colleges since termination of hostilities.

Engineering, Science, and Management War Training. This program of short intensive college-level courses, designed in close collaboration with the industries, served to train men and women for specific technical and supervisory positions in war industries. It was terminated in June. The program was originally approved by Congress on Oct. 9, 1940 for the training of engineers, and later expanded to cover the training of chemists, physicists, and non-engineering production supervisors.

During its five years of operation, a total of 227 colleges and universities gave training to 1,795,716 persons, of whom 1,337,225 were trained in Engineering, 38,838 in Chemistry, 32,415 in Physics, and 387,238 in the non-engineering aspects of Production Supervision. Women constituted 16 percent of the total trainees.

Participating institutions were reimbursed for actual expenses incurred in conducting courses, the total amount thus expended being approximately \$58,000,000.

JOHN W. STUDEBAKER.

EGYPT. A kingdom in the northeastern part of Africa. The ruler in 1945 was Farouk I, who succeeded to the throne on Apr. 28, 1936. The total area of the country is approximately 386,198 square miles. Most of this, however, consists of desert, the habitable area in the Nile Valley and nearby oases comprising only some 13,600 square miles.

Government. The monarchy is hereditary in the male line. The present constitution, originally promulgated in 1923, was reintroduced in December 1935 after having been abrogated in October 1930. The Parliament consists of a Senate and a Chamber of Deputies. Two-fifths of the members in the former are appointed by the King, the rest being elected for ten-year terms. The 264 deputies are elective. Universal male suffrage prevails. The

Council of Ministers is appointed by the King but is responsible to Parliament—a somewhat anomalous constitutional situation that has given rise to complications.

Egypt proper is divided into five governorships and fourteen provinces. In addition, there are the extensive outlying desert areas, inhabited largely by nomads. Certain matters involving personal status are still subject to the jurisdiction of religious courts. Other cases involving Egyptians are decided before the national courts. By the Convention of Montreux of Oct. 15, 1937, the system of Mixed Courts was scheduled to disappear in October 1949. After that date foreigners in Egypt will be subject to the same judicial treatment as Egyptians.

During recent years the budget figures have been greatly influenced by abnormal wartime conditions. However, the Egyptian Government has usually managed to balance its budget over a period of time. The total amount of government debt as of May 1, 1942, was £92,706,520, on which the annual charges were £E4,101,903.

The defense of the country is nominally the responsibility of the Egyptian army and navy. During the last six years, however, the British and Allied forces have in effect defended Egyptian independence. Under Article 8 of the Anglo-Egyptian Treaty of Alliance of 1936 the British are authorized to station forces in the vicinity of the Suez Canal to insure its defense. Britain also has rights to use certain aerial and naval facilities.

Egypt is one of the two states exercising sovereignty over the Anglo-Egyptian Sudan, the Governor-General of which is nominally an appointee of the Egyptian Government (see ANGLO-EGYPTIAN SUDAN).

Cairo is the capital, except during the summer months, when the court and the cabinet move to Alexandria.

Events, 1945. The year opened in the midst of an electoral campaign preparatory to the general elections of Jan. 8. On that day the polling was heavy and in many constituencies close, but without the disorders that have marked previous elections. In sixty-one constituencies new votes had to be taken a week later because no candidate in them received a clear majority. The final results showed the following line-up: Saadists (the Government party) 124, Liberals 74, Makramists 30, Independents 29, Nationalists 7. The Cabinet was revised to include two additional portfolios.

The trial of the two Jewish terrorists accused of assassinating Lord Moyne on November 1944 began on Jan. 10 before the Supreme Military Court in Cairo. The two accused admitted having committed the crime with premeditation and declared they had come to Cairo under orders from a secret society. The prosecution asked for the death penalty, which was imposed on Jan. 22. The terrorists were hanged in Cairo on March 22.

At Yalta the Big Three had indicated that neutral countries which wished to participate in the San Francisco Conference must gain admission by declaring war against the Axis. Presumably to carry out this suggestion, Prime Minister Ahmed Maher Pasha on Feb. 24 read in the Chamber of Deputies a decree of King Farouk declaring war on Germany and Japan. As he was leaving the Chamber a few minutes later several shots were fired at him, and he died shortly afterwards. The assassin was a young lawyer who admitted having committed the crime and who was known to have had pro-Axis sentiments for which indeed he had spent some time in a concentration camp. The moderate policy of Dr. Maher was regarded with

great distaste by many nationalist Egyptians, though the Nationalist Party naturally dissociated itself from this act of violence. To replace Dr. Maher the King appointed Fahmy Nokrashy Pasha, Vice President of the Saadist Party, to serve as Prime Minister. Nokrashy's place as Foreign Minister was taken by Abdul Hamid Badawi Pasha, who was soon to leave for San Francisco as head of the Egyptian delegation to the UNO Conference.

Early in September it was announced that the Council of Ministers had approved a five-year plan involving the expenditure of £E25,000,000, ostensibly to relieve unemployment. This large sum was to go for the construction of schools and hospitals, the installation of irrigation and drainage projects, the purchase of rolling stock for the railways and the acquisition of American and British workshops set up in Egypt during the war. In general the Government showed signs of pursuing an enlightened policy in regard to the problem of raising the standard of living of the Egyptian masses.

Foreign Relations. Early in January the American mission in the Middle East under James M. Landis completed its work and disbanded. Simultaneously Egypt and Britain entered into a preliminary financial agreement according to which the British Government made available some \$40,000,000 for the purchase of American, Swiss and Swedish goods by Egypt. British traders in Egypt complained that this agreement put them at a disadvantage, while Egyptians complained that the sum involved represented only a small part of the vast sum of blocked funds held for their account in London—a sum said to be over £400,000,000. Henceforth the control exercised by the Middle East Supply Centre was to be limited to those commodities which would make heavy demands on shipping.

In the middle of February, en route from Yalta back to the United States, President Roosevelt paid a brief visit to Egypt. While there he received on board an American cruiser in the Great Bitter Lake of the Suez Canal three Middle Eastern monarchs, of whom the first was King Farouk. According to the official announcement made from the White House on February 20, their conversation dealt with the importance of reviving trade between the two countries and the expansion of American tourist travel in Egypt. Mr. Churchill also had a talk with the King on Feb. 17, but on what subjects was not revealed. On Feb. 28 Egypt became officially a member of the United Nations when its Minister in Washington signed the UNO Declaration at the State Department.

The Anglo-Egyptian Treaty of 1936 was due to expire in 1946. In anticipation of this event Egyptian public opinion became thoroughly exercised over such issues as the evacuation of British troops from the country, the revision of the status of Britain within the Suez Canal Zone and the continuation of the condominium in the Sudan. On Aug. 6 the Egyptian Prime Minister made a moderate speech on the subject in the Egyptian Senate, which was far from pleasing to the ultra-nationalist group. On Sept. 23 the Egyptian Cabinet issued a communiqué asking for the withdrawal of British troops and the incorporation of the Anglo-Egyptian Sudan into Egypt. These demands were made after careful consultation with a committee of Egypt's elder statesmen and was doubtless motivated by the fact that for two months England had failed to answer Egypt's written demands looking in this direction. The King, in opening Parliament on Nov. 12, declared: "Egypt is more resolved and

united than ever to bring about the disappearance of every restriction on her independence by the withdrawal of foreign forces and by the affirmation of unity in the Nile Valley." A formal request for revision of the treaty was presented at the British Foreign Office by the Egyptian Ambassador in December.

At the time of the London Conference of Foreign Ministers in September the Egyptian Government put forward claims for the annexation of Eritrea and for a trusteeship over Libya in case the latter colony were not given its complete independence. In October there were anti-British demonstrations in Cairo, which clamored not only for the preservation of Arab rights in Palestine but for immediate British withdrawal from Egypt. On the 15th students of the famous El Azhar University adopted resolutions underlining these demands. As the year wore on it became obvious that the nationalist forces in Egypt were gathering strength and that the British would find it increasingly difficult to justify their maintaining a strong military foothold in the country now that the war had ended in the Pacific.

Pan Arab Affairs. The traditional jealousy between the two reigning houses of Egypt and Saudi Arabia was believed to have been attenuated by a visit which King Farouk made to Ibn Saud in the Hejaz during the last week of January. Pan Arab leaders hailed this rapprochement with delight, and it undoubtedly paved the way for the creation of the Arab League by the Conference which assembled in Cairo on Feb. 14 (see PAN ARAB AFFAIRS). As a result of these conversations the Arab League actually came into being, with Cairo as its headquarters and with Farouk's Minister of Arab Affairs, Abdul Rahman Azzam Bey as its Secretary-General.

On Nov. 1 mobs in Cairo and Alexandria rioted against Jews and their property. Several were killed and much property was destroyed. Further disturbances took place on the next day, with hundreds of rioters being arrested. Order was finally restored, but not before a great deal of damage had been done and many stores looted, some of them belonging to foreigners and even to Egyptians.

Characteristics of the People. The estimated population in 1942 was 17,287,000—and is growing rapidly. The population of the three largest cities was: Cairo, 1,312,096; Alexandria, 685,736; Port Said, 124,749. The great mass of the population professes Islam. There are, however, approximately one million Copts and Greek Orthodox, in addition to some 80,000 Protestants, 130,000 Latins and Uniates, and 65,000 Jews. Egypt is the seat of the Coptic Church, to which the Christian population of Ethiopia also adheres (see ETHIOPIA). The great center of Moslem learning is the University of El Azhar in Cairo, to which students come from all over the Islamic world. According to law, education is compulsory for all children from seven to twelve years of age, though this rule is not rigidly enforced. The Government provides more educational opportunities for girls than do many other Moslem countries. There are fifty secondary schools supported by the Government, as well as eighty-one private institutions. Technical education is furnished in over fifty schools. There are also two state universities: the University of Fuad I in Cairo and the University of Farouk I in Alexandria. Arabic is the official language, and is spoken by most Egyptians. French and English are widely understood among the educated classes.

Social and health conditions leave much to be

desired, and one of the great problems of contemporary Egypt is to raise the standard of living and sanitary conditions among the masses, both rural and urban.

The Country and Its Economy. The only part of the extensive area of Egypt that has any real economic value is the Nile Valley. Above Cairo this is quite narrow, but in Lower Egypt it widens out into the fertile Delta. Thanks to the water and the fertilizing qualities of the Nile River this relatively small area has been able to support a dense population for several millenia. It is possible to raise two, or even three, crops a year. During the British occupation the economy of the country was directed into the production of cash crops, such as cotton, rather than foodstuffs. In Egypt the unit of area is the *feddân*, which equals 1.038 acres. In 1940 1,684,869 feddâns produced 9,189,634 qantârs of cotton (a *qantâr* is the equivalent of a hundred-weight). In 1940-41, 1,502,381 feddâns were put into wheat, 255,776 into barley, 368,870 into beans, and 32,538 into onions. In 1943 there were 1,950,957 feddâns of corn, 729,106 feddâns of millet, and 642,121 feddâns of rice. In 1943 the country possessed 30,896 horses, 826,796 donkeys, 1,202,284 cows, 1,100,124 buffaloes, 1,423,772 sheep, 759,794 goats and 174,054 camels. Egypt's oil production in 1941 was 1,220,557 tons, and in 1944 some 1,800,000 tons. Explorations have been going on in the hope of discovering larger fields, but thus far with little success.

In 1938, the last prewar year, Egypt's imports were valued at £E36,954,373 and her exports at £E29,342,485. Her trade with Great Britain, as regards both exports and imports, was greater than that with any other country. The United States came second as to imports, and France second as to exports.

The Egyptian railway system comprises some 2,750 miles of main line in addition to nearly 1,000 miles of light railways. Egypt has been united by direct rail communications with Syria and Turkey since the British Army completed building the 175-mile line between Tripoli (Lebanon) and Haifa during the war. The rivers and canals of Egypt are extensively used for transport.

The country enjoys a strategic location along some of the world's principal air routes, which connect the three continents of the Eastern Hemisphere. The Suez Canal passes through Egyptian territory but is subject to a special regime (see SUEZ CANAL) and is owned by a French corporation. According to the terms of the concession under which the Canal was constructed, it is to revert to the Egyptian Government in 1968.

ROBERT GALE WOOLBERT.

EIRE (IRELAND). A sovereign, independent state, affiliated for certain purposes with the British Commonwealth of Nations; comprising the 26 counties of Southern Ireland formerly designated the Irish Free State. The name was officially changed to "Ireland" in English and to "Éire" in Gaelic by the Constitution effective Dec. 29, 1937. The area of Éire is 26,601 square miles.

Government. Under the Constitution proclaimed Dec. 29, 1937, there is a President elected by popular vote for 7 years. The Oireachtas (Parliament) includes two houses: the Dail Éireann or House of Representatives of 138 members elected by popular suffrage for five years, and the Seanad Éireann or Senate of 60 members (43 elected on a vocational basis, 6 elected directly to represent the two universities, and 11 nominated by the Prime Minister). Executive power is ex-

ercised by the Government, or Cabinet, which is responsible to the Dail. In the election of June 14, 1945, Sean T. O'Kelly was elected President, succeeding Dr. Douglas Hyde. Prime Minister Eamon de Valera, leader of the Fianna Fáil party, was elected by the Dail Éireann on June 30, 1938, and reelected June 9, 1944.

Events, 1945. The status of Éire in relation to the British Commonwealth was under discussion after July 11, when Prime Minister Eamon de Valera, replying to a question in the Dail Éireann, asserted that Éire was a republic. Again in the Dail on July 17 de Valera insisted that Éire was an independent republic "associated as a matter of our external policy with the states of the British Commonwealth." Pressed by Opposition leader James Dillon, an advocate of Éire within the Commonwealth, to say whether Éire was within the British Commonwealth, de Valera replied that the material necessary for a conclusive answer was not available.

The discussion caused speculation as to whether Éire was contemplating secession from the British Commonwealth, although there seemed to be little evidence of that intention. At the annual convention of de Valera's party, Fianna Fáil, in Dublin on Nov. 6 the Prime Minister made it clear that he had no intention of severing the links which kept Éire in association with the British Commonwealth. A motion to leave the Commonwealth was withdrawn after de Valera argued that although Éire was a sovereign independent republic there was nothing inconsistent in having the British King sign letters of credence of foreign diplomatic representatives coming to Éire and of representatives of Éire going abroad.

The surrender of Germany was followed by a revival of discussion about Éire's position of neutrality and by minor disturbances at home. On May 13 Éire's neutrality was sharply criticized by Prime Minister Winston Churchill in the British House of Commons. Immediately after the surrender localized rioting, centered in large part around Trinity College, resulted chiefly in broken windows. Apologies were made by the Minister of External Affairs to the American consulate and the British representative's office, where windows were broken, and by the Provost of Trinity College to Prime Minister de Valera. Replying on July 19 in the Dail Éireann to Deputy James Dillon's criticism of his call upon the German Minister to express his regret at the reported death of Adolf Hitler, de Valera declared that he had merely followed universally established practice and that no question of approval or disapproval was involved.

Domestic Problems. Early in July the crushing of a plot to overthrow the de Valera government was made public. On July 4 the Prime Minister, in a debate in the Dail, disclosed that he had found it necessary to re-intern Sean McAteer, former chief of staff of the Irish Republican Army. McAteer was imprisoned by the Government of Northern Ireland in 1944 (See YEAR BOOK for 1944, p. 305). Released with other internees after the European war ended, McAteer had been plotting against the Government, de Valera said, and had publicly recruited new members for his outlawed organization. Others who had been released were under suspicion of plotting against the Government, murdering police officers and holding illegal meetings, the Prime Minister said.

It was later disclosed that 40 members of the outlawed Irish Republican Army had recently been arrested. Police authorities said that the

would-be rebels were among some 400 I.R.A. members released from the Curragh internment camp. Sean MacCool, commander in chief of the outlawed army, was arrested as he was about to board a train for his home in Mayo. It was understood that the chief target for assassination was Police Superintendent John Gantley.

On Armistice Day units of Southern Irish branches of the British Legion went to the War Memorial Park by separate routes because their parade had been banned. They wore their medals under their overcoats and carried their flags furled. In a special service at St. Patrick's Cathedral, Canon E.W.F. Campbell gave the number of Irish volunteers as 160,000. Unemployment benefit for these volunteers was an unsettled question in Britain at this time. In a memorial presented to Prime Minister Attlee by General Sir Hubert Gough, president of the Commonwealth Irish Association, and a number of other signatories in late November, it was pointed out that all these volunteers, whether servicemen or civilian war workers, were entitled on demobilization to full benefit under the United Kingdom unemployment insurance code. Return to Eire meant, however, forfeiting their unemployment rights, so that repatriation deprived them of a valuable protection against unemployment to which they had contributed.

Foreign Trade. Eire's postwar plans laid heavy emphasis upon the expansion of the country's foreign trade. Prime Minister de Valera summoned his foreign diplomatic representatives to a special conference in Dublin on Sept. 11 to hear a review of Eire's foreign trade plans, which were understood to provide for agreements with the United States, Canada and Great Britain. The possibilities of increased trade with the United States were described on Oct. 11 at the Publicity Club in Dublin by American Consul General Thomas McEnelly. Although McEnelly said frankly that such agricultural products as livestock and butter could not find a market in the United States, there was an increasing demand for whisky, wool, rabbit skins and a number of other products as well as for such Irish specialties as lace, gloves and pottery.

Eire's export position with respect to Britain was complicated by the fact that Britain, normally the market for 90 per cent of Irish exports, had not been able to sell the equivalent to Eire during the war, and that as a result Irish sterling balances accumulated in England amounted to approximately £230,000,000 in 1945. Until Britain could settle this obligation the trade future remained obscure. De Valera gave intimations in the Dail in July that a working arrangement could be reached if Britain would end the partition of Northern Ireland from Eire, but the events of the war appeared to have made that solution increasingly remote. Sean Lemass, Irish Minister for Industry and Commerce, visited London in early October, but de Valera, asked to comment, said in the Dail on Oct. 10 that the time for full-scale trade discussions had not yet come. Officials of the Ministry of Industry and Commerce intimated that Eire's strict limitation and control of exports would be maintained for a considerable time.

In the meantime Lemass was prodding domestic industry to improve its efficiency and the Federation of Irish Manufacturers, Ltd. was seconding his efforts. On the negative side, companies that lagged in either production or management were under the threat of being scrapped. On the positive side, the Ministry of Industry and Commerce

was granting, in the latter part of 1945, high priority ratings for import licenses and dollar exchange for the purchase of such supplies as textile machinery, modern distilling equipment, machine tools, and shoe manufacturing machinery. Eire was a member of the sterling area and the dollar pool, and Britain, the manager of the pool, was granting promptly requests for the purchase of machinery and other essentials from the United States. Eire retained a slightly favorable balance of trade when invisible items were taken into consideration and had no external debt to service.

The internal financial position showed the effects of subsidies for food and fuel, children's allowances, an additional bonus to public servants and the mounting costs of the civil service, and a small budget deficit was anticipated for 1945-1946. At the same time Eire was carrying through a program for Irish Aid to Europe developed earlier in the year. In October a shipment of draught animals, meat cattle and other supplies reached Rotterdam, and the Netherlands was arranging to buy in Eire some 6,000 head of cattle and 700 horses.

Air services from Eire developed rapidly in the latter part of the year. Early in November the Eire company, Irish Airways, resumed its Dublin-London service, suspended in 1939. By the first week in December two commercial services were operating between Dublin and Liverpool. American airplanes utilized airports in Eire in the course of American-British discussions on passenger rates. Eire's geographical position was the basis for optimistic predictions for the future of her airports, and it was assumed that Commerce Minister Lemass' October visit to London, where he held conferences with Lord Winster, British Minister of Civil Aviation, broke the ground for an improved position for Eire in transatlantic services.

The People. In the census of 1941 the population stood at 2,989,700. Primary education in the country is directed by the State, and there is almost no illiteracy. Almost all (94 per cent) of the people belong to the Roman Catholic Church, with the remainder divided among Episcopal, Presbyterian, Methodist and other churches.

The Economy of the Country. Agriculture, stock raising, manufacturing and fishing are the chief occupations of the people of Eire. Flour, sugar, jams, tobacco products and alcoholic beverages rank high among the goods manufactured. Eire showed a favorable balance of trade in 1943, with imports at £26,082,107 and exports at £27,479,776.

ALZADA COMSTOCK.

ELECTIONS, U. S. Interest in elections in 1945 with few exceptions was centered on municipal contests. Mayors were elected in many of our largest cities including Boston, Buffalo, Cleveland, Detroit, Los Angeles and New York and state-wide elections of general interest were held in Connecticut, Ohio, Pennsylvania, Massachusetts, New Jersey and New York.

The only state electing a Governor during the year was Virginia where Lieutenant Governor William M. Tuck succeeded Governor Colgate W. Darden, Jr. Also elected in Virginia were Lieutenant Governor, Attorney General, members of the House of Delegates, and certain local officials.

There were but two Congressional contests. In a special election in the 24th Congressional District in Illinois Mr. Roy Clippinger was elected and in the 4th Congressional District in New Jersey Mr. Frank A. Mathews, Jr., won. Both were Republicans.

Illinois also had a general election for certain

municipal officials in April and for county commissioners in June, while New Jersey elected county and municipal officials in November as well as members of the State Legislature. The Republicans won decisive majorities in both houses of the State Legislature. In Kentucky where the members of the State Legislature were also elected, the Democrats won control of the State Senate by a margin of 20 to 17 in one of the closest contests in history. The House of Representatives continued Democratic by a two-thirds majority. There were few judicial contests in 1945 with the election of two Superior Court Justices in Pennsylvania and Supreme Court Justices in Illinois, Michigan, Wisconsin and New York being of most importance.

Municipal, township and school elections on a state-wide basis were conducted in South Dakota in the spring and the State Superintendent of Schools and various judicial officials were chosen in Wisconsin on April 3.

Changes in State Constitutions. On Aug. 7, Georgia voters in a special election by a margin of three to one adopted a streamlined Constitution to replace the much-amended version of 1877. The new Constitution establishes county and municipal home rule; provides for additional school financing on a county-wide basis; establishes the merit system for state employees; eliminates any possibility of a poll tax being re-established; increases the salaries of the Governor, Judges and Legislators, and modernizes the State's penal system.

Five of the six amendments proposed to the New York Constitution carried, and in addition a proposition was approved calling for an increase of from \$5,000,000 to \$6,250,000 in the permissible state subsidy for low-rent housing. The Constitutional Amendments which were approved by New York voters would: 1) eliminate special elections for Lieutenant Governor unless a Governor was also to be elected; 2) permit voters who move from a non-personal registration district 30 days before an election to vote; 3) authorize the division of large towns in establishing assembly districts; 4) permit county supervisors to override decisions of county executives on local legislation; 5) extend existing Civil Service preferences to veterans.

A proposed amendment to elect the Governor and Lieutenant Governor on a joint ballot lost. All of the other amendments were adopted by substantial margins with the exception of the veterans' preference proposal which was approved by a small majority.

During the year eight cities adopted, by referendum, the council-manager form of government. There are now approximately 358 cities, having a population of 5,000 or over, operating under the council-manager plan.

Mayoralty Elections. The most important elections of 1945 were the mayoralty contests which were held in approximately 450 cities with a population exceeding 10,000. Many of these local elections were held in April or May; a few were scheduled for the summer, and the balance for November. Mayoralty elections were conducted in all but three of the States during 1945.

A summary of the outcome of the more important mayoralty contests follows:

Albany, N.Y.—Despite a grand jury investigation and a spirited campaign, the Democratic administration was returned to office and Erastus Corning was re-elected Mayor.
Akron, Ohio—Charles E. Slusser (R) was re-elected after a close race.
Atlanta, Ga.—William B. Hartsfield (D).
Birmingham, Ala.—W. Cooper Green (Non-Partisan).
Boston, Mass.—Congressman James M. Curley (D) won over five opponents, polling nearly as many votes as

all five combined. A former Governor of the State, this will be Mayor Curley's fourth term as Mayor.

Bridgeport, Conn.—Jasper McLevy (Socialist) re-elected for the seventh consecutive two-year term.

Buffalo, N.Y.—Bernard J. Dowd (R) won a surprise victory by some 20,000 votes.

Cleveland, Ohio—Thomas L. Burke (D) won 68 per cent of the votes and became the first Mayor to succeed himself in 25 years.

Detroit, Mich.—Mayor E. J. Jefferies (Non-Partisan) re-elected for a fourth term by 57,518 votes over Richard T. Frankenstein, OIO and Political Action Committee candidate in a heated campaign involving indirectly racial and religious issues.

Hartford, Conn.—Cornelius A. Moylan (R).

Louisville, Ky.—E. Leland Taylor (D) won by 205 votes with approximately 100,000 votes cast. A contest will probably be filed. All of the Aldermen are Republicans.

Los Angeles, Calif.—Fletcher Bowron (Non-Partisan).

Minneapolis, Minn.—Hubert H. Humphrey (Non-Partisan).

New York City—William O'Dwyer (D), Tammany Hall candidate was elected by a plurality of 685,175, one of the largest in the City's history. In addition to Democratic support, Mayor O'Dwyer was backed by the American Labor Party while Judge Jonah J. Goldstein, former Democrat who ran as the Republican candidate, was endorsed by the Fusion and Liberal Parties. Mr. Newbold Morris ran on a "No Deal" ticket and had the support of retiring Mayor La Guardia. Mayor O'Dwyer is the first Democrat to hold the office in twelve years.

Omaha, Neb.—Charles W. Leeman (D).

Pittsburgh, Pa.—David L. Lawrence (D).

Portsmouth, N.H.—Mrs. Mary C. Dondero (D) 'was re-elected

St. Louis, Mo.—A. P. Kaufmann (R).

Syracuse, N.Y.—Frank J. Costello (R).

Wilmington, Del.—Thomas Herlihy, Jr. (R).

Servicemen's Voting. Voting by servicemen in a number of instances continued to affect the outcome of close election contests. As in the 1944 elections, the Democratic candidates continued to receive approximately 10 percent more of the servicemen's vote than the Republicans. With the prospect that for some years large numbers of Americans will continue to serve in the Armed Forces both here and abroad, efforts were continued to extend and liberalize State and federal election laws so as to make even more effective existing opportunities for servicemen to vote. The report of the War Ballot Commission (Senate Document 6, 79th Congress, 1st Session) indicating that only 108,692 Federal War ballots (the short form ballot) were cast out of a total of 2,700,000 servicemen's votes led to a drive by a number of Congressmen and the National Association of Secretaries of State to amend the Soldier-Voting Law by repealing Title III providing for a Federal War ballot. The fact that the Secretary of War in concluding a report to Congress on the subject raised questions concerning the utility of the Federal War ballot gave additional impetus to the drive to eliminate such a voting procedure. Action by Congress to revise war voting legislation is expected early in 1946.

Presidential Succession. Another subject being considered by Congress during 1945 and of general interest had to do with presidential succession legislation providing for the naming of a President in case anything happened to President Truman. The House of Representatives during the summer passed a bill placing the Speaker of the House next in line of succession, which was in accord with President Truman's recommendations. The Senate has taken no action on the House bill seeming to prefer the present succession statute enacted in 1886 which provides that the Secretary of State, in the absence of a Vice President, shall succeed to office in the case of the death of the President. The fact that the present Secretary of State is a former Senator may explain the present legislative impasse. Failure to act on the legislation left unsettled such questions as: Would a special election

be necessary to elect a President under the present law or would the Secretary of State serve out the unexpired term of the President? Could Congress call a special election and if it did, could the Acting President question the constitutionality of such an election? Would he serve out the term of his predecessor or only as temporary President until a special election could be held? These were some of the questions that the Senate Privileges and Elections Committee had before it when President Truman's dangerous flight to his Missouri home on Christmas Day dramatically emphasized the necessity for completing action on the President's recommendations for re-writing the succession law of 1886.

On Jan. 1, 1946, the Democrats held 242 seats in the House of Representatives; the Republicans 191; the American Labor Party and Progressive Party one each. In the Senate the Democrats have 56 Senators, the Republicans 39 and the Progressives one (LaFollette of Wisconsin).

There are today 25 Democratic Governors and 23 Republican Governors. Preceding the presidential election of 1944 there were 26 Republican Governors and 22 Democratic Governors.

Trends. Although political prognosticators issued their usual partisan interpretations concerning the outcome of the November election there were no unusual upsets. The Democratic-American Labor Party landslide in New York City was offset by Republican gains in formerly Democratic controlled up-state cities such as Buffalo. The large cities throughout the country continued to elect Democratic Mayors while numerous county, town and rural elections went Republican.

HUBERT R. GALLAGHER.

ELECTRICAL INDUSTRIES. The year ended with a strong and continuing downward trend in production of electrical machinery, reflecting the termination of government war contracts. Similarly, Department of Commerce indexes for shipments, new orders, and inventories, were at the lowest yet reached. The production index for electrical refrigeration equipment and also for electrical appliances, was rising steadily, and is expected to continue to rise in 1946, perhaps reaching 1940 and 1941 levels. The trend for industrial apparatus and miscellaneous electrical material also was strongly downward, the high points having been reached in 1943 and 1944, the peak war production years. The electrical manufacturing industry's general production-index, therefore, was declining sharply at the year-end. Similar trend was reflected in corresponding movement of the Federal Reserve Board index of general industrial production. Outstanding contrast was presented by the index representing the generation and sale of electric power, which was holding.

Considering 1940 production figures as an index of 100, production of electrical appliances was at 40 compared with 11 for 1944; electrical refrigerators at 13, compared with 3; electrical material at 244, compared with 337; industrial electrical apparatus at 285, as compared with 356; electric power transmission and distribution equipment at 114, compared with 100; insulated wire and cable at 126, compared with 144.

Considering further figures for 1940 as an index of 100, the electrical manufacturing industry over-all production-index for 1945 stood at 283, as compared with a Federal Reserve Board general industry figure of 168, and a population index figure of 106. In other words, electrical manufacturing industry production, although receding

from its wartime peak was still 68 percent above the general manufacturing index for 1945.

According to year-end reports issued by the Electrical Manufacturers Association, 1944 was the industry's peak production year, during which some 9 billion dollars worth of electrical apparatus equipment and supplies were produced. The 1945 level amounted to approximately 7 billion dollars, and the expectation for 1946 is from 4 to 4.5 billion dollars, about the same as for the last normal peacetime year of 1940. It should be remembered that while certain elements of the electrical manufacturing industry continued to produce peacetime electrical goods during the war years, large portions of the industry normally producing refrigerators, appliances, and other materials not essential to wartime requirements were completely converted to the manufacture of machine guns and such wartime items. These substantial elements of the industry were faced with the necessity for complete reconversion and retooling, to enable resumption of production of normal peacetime electrical goods.

Typical of wartime electrical developments and applications was the all-electric torpedo developed for the Navy. An electrically driven torpedo leaves no tell-tale wake in the water to reveal its presence as did its predecessor, the air-driven torpedo. 10,000 electric torpedoes were made in a plant normally devoted to the manufacture of electric power transformers. The torpedoes are driven by a new type of motor designed especially for the purpose and developing the greatest horsepower for its weight of any motor ever built. A "proximity fuze" developed and used during the latter part of the war included a tiny special radio broadcasting and receiving set which determined the proximity of shells, rockets, and bombs to their targets, and exploded them when they came within the predetermined distance of 75 feet. This was one of the most significant and effective developments of the war. In the advance models of the proximity fuze, a wind-driven generator, so tiny that it could be held in the palm of one's hand, furnished the power for the radio beams. This generator operated at the fantastic speed of 40,000 rpm. The invention and improvement of radar equipment were outstanding prewar and wartime electronic developments. (See COMMUNICATIONS; ELECTRONICS; SHIPPING.)

The year marked the 100th anniversary of the birth of Roentgen, and the 50th anniversary of his discovery of x-rays. Industrial x-ray equipment development took a seven league step during the year, with the announcement of a 100-million-volt x-ray machine officially known as an induction electron accelerator, or "Betatron." The new Betatron produces x-rays far more powerful than any previously attained, capable of penetrating a thickness of metal considerably greater than the 12 inches or so reported last year for the then record 2-million-volt x-ray machine. The Betatron also is the source of radiations other than x-rays, which are expected to be of significant value in research in the new field of atomic, or nuclear, energy. Creation of matter from energy, reverse of the process in the atomic bomb, can be accomplished with radiation from the new device. For example, an ordinary half-dollar coin can be made to give off rays like those of radium by a few minutes' exposure to the intense radiation stream from the Betatron, the action resulting from the transmutation of silver to cadmium and to palladium, and the accompanying transmutation of the copper of the coin's alloy to nickel. These laboratory transmutations, al-

though sub-microscopic in magnitude, are actual and indicate the possibilities of a startling new era.

Relinquishment of wartime security controls revealed that a 20,000,000-volt Betatron has been in service at a government arsenal since late in 1943, where it was used to take x-ray photographs through ordnance steel up to 15 inches or more in thickness, to reveal any internal flaws.

High-voltage electric power cable insulated with butyl compound went into service during 1945, and established excellent performance records. Poly-ethylene insulation, used extensively during the war for high-frequency coaxial insulation, was shown to have dielectric and physical properties desirable in such items as control cable, power cables, communication, and television cables. "Operation PLUTO" (Pipe Line Under The Ocean), one of the most effective secret weapons in the Allied invasion of continental Europe, and the means of getting a million gallons of gasoline per day from England to France without the use of highly vulnerable tank ships, can be credited in substantial measure to American manufacturers of electric-power cable. The project comprised a group of 20 three-inch oil pipelines laid on the bed of the English Channel. One type of the pipe was essentially a submarine electric power cable minus power conductors and core.

Welding, in the early 1900's, was just a handy process for repairing broken metal parts. By the 1920's it was being used extensively in the manufacture of pipelines and pressure vessels. In the 1930's, the Germans made the first welded battleship, saving much weight for extra guns and fooling the world as to the strength of apparently small vessels. In 1937, was built the first U.S. ocean-going all-welded tanker. By 1945, at the end of World War II, welding had become a giant in industrial fabrication processes. It was the primary process used in assembling 3,500 U.S. wartime cargo ships, and it played an essential part in the production of many billions of dollars worth of ordnance and other wartime equipment. This huge evolution was contributed to by an enormous research program. In the period 1942-45 inclusive, the Office of Scientific Research and Development made huge outlays for welding research. This was augmented by private-industry research programs such as the quarter-million dollars provided for welding studies in 1945 by the Welding Research Foundation—jointly sponsored by the American Welding Society and the American Institute of Electrical Engineers. Significant developments included low-alloy electrodes (welding rods) with which a novice as well as an expert could weld armor plate up to more than 4 inches of thickness; automatic welding machines; power-operated work-holding machines of heavy tonnage capacity, that move heavy work readily into positions for most rapid and efficient welding; "stored-energy" spot-welding equipment for aluminum and other light metals, which enabled the large metal surfaces of airplanes for example, to be "sewn up" almost like, and as rapidly as, a huge sewing machine could sew up fabric.

Electric blankets, with accurate and sensitive electric or electronic controls to maintain even temperature for the sleeper regardless of variable room temperatures, were appearing on the retail market by the close of 1945, reflecting the industry's extensive and successful experience with electrically heated aviation clothing for the crews of high-flying military aircraft. Work was reported to be underway on the first all-electric

railroad dining car. Patterned upon the electric galley developed for naval submarine installation, the kitchen is to be equipped with heavy-duty electric ranges, automatic broilers and deep-fry kettles, bake ovens, grills, griddles, coffee makers, dish washing and refrigerator equipment. Dining space in the car will have the newest lighting and air-conditioning equipment. The car will be completely self-contained, with electric power furnished by two Diesel-engine-driven electric generators.

Probably the world's largest electric refrigerator was a 15-acre storage cave operated in Kansas by the War Food Administration for the summer storage of perishable foods. Capable of handling from 30,000 to 50,000 tons of food, the refrigeration capacity was 250 tons every 24 hours. Air-conditioning is beginning to appear on trolley cars and motor buses, for operation in the southern States.

G. ROSS HENNINGER.

ELECTRIC LIGHT AND POWER. American industry with its mass-production methods furnished the bulk of the material which turned the tide of World War II and brought it to Allied victory. The American electric light and power industry furnished the energy which turned the wheels of industry and gave to each industrial worker greater production capacity than any other worker in the world.

Power Production. Receding by 3.6 percent from the all-time high record established in 1944 by the demands of war, the electric power output in the United States for 1945 totalled about 222.4 billion kw-hr. This was the first time since 1938 that there was any recession in the steadily increasing annual output of electric power. Even so, 1945 power output exceeded 1939 power output by 71.5 percent. Fuel-burning electric generating plants produced about 63.8 percent of the total for 1945, as compared with 68 percent for 1944, and 66.7 percent for 1943. Hydroelectric generating plants produced 36.2 percent of the 1945 total, the largest proportion in several years.

Of continuing significance is the steady growth in the proportion of the total electric power generation coming from government-owned projects. Federal government power plants in 1945 turned out more than twice as great a share of the nation's total electric power as in 1940. Selected electric-power production statistics are given in Table 1. The relatively sharp drop in the "use and losses" figures in this tabulation between 1944 and 1945, reflect the release of some inefficient plants and equipment from service following the termination of hostilities.

TABLE 1—ELECTRIC POWER PRODUCTION IN U. S.
(Billions of kilowatt-hours)

Year	From Fuel	From Hydro	From Canada	Gross Total	Uses and Available Losses	for Sale
1945*...	142.2	80.1	1.8	224.1	30.2	193.9
1944*...	156.6	74.0	1.6	232.2	34.1	198.1
1943 ...	147.3	73.9	1.5	222.7	31.2	186.9

* Preliminary figures. † Revised figures.

Finances. Although the estimated total of 193.9 billion kw-hr of electric energy sold during 1945 represents approximately a 2.5 percent decrease from the 1944 all-time peak, the total revenue from the sale of electric energy increased by about 2 percent. This seeming disparity resulted from the relinquishment of wartime restrictions on the utiliza-

tion of power, which stepped up the proportion of power sales in the higher-price smaller-quantity brackets as compared with the wartime concentration in the low-price large-quantity industrial bracket. In the class of large light-and-power customers, revenue dropped about 3 percent, amounting to about \$29,000,000; in the municipal and miscellaneous class, revenue dropped about 9 percent, amounting to \$8,500,000. Revenue from all other classes of electric light and power customers increased, reflecting increased power availability to and utilization by those classes. Greatest increases were noted in the rural and the residential classes, where the increases were approximately 9 percent and 7 percent respectively, representing in money about \$7,000,000 and \$70,000,000.

Estimated total gross revenue from all electric power sales amounted to about 3.33 billion dollars, as compared with revised figures of 3.28 billion for 1944, and 3.08 billion for 1943. As the result of an increase in the total number of small light-and-power customers, the total revenue from this class was up about 2 percent. Continuing a trend of many years standing, the consumption of electric energy by the average American household again increased and the cost decreased. Average residential use of electric power was estimated at 1,225 kw-hr, for which the average bill was \$41.90, reflecting an average rate of 3.42 cents per kw-hr, a new low point. Comparable figures for 1944 were 1,151 kw-hr at 3.51 cents; for 1940, 952 kw-hr at 3.84 cents; for 1935, 672 kw-hr at 4.99 cents; for 1930, 543 kw-hr at 6 cents; for 1926, 428 kw-hr at 6.98 cents. The average annual bill per rural customer increased from less than \$71 in 1944 to nearly \$74 in 1945, reflecting an average rate of 2.47 cents per kw-hr for both years.

A statistical summary of data reflecting electric power sales and related revenue is in Table 2.

TABLE 2—ELECTRIC POWER SALES AND REVENUE

	Total Number of Customers	Energy Sales in Millions of Kilowatt- Hours	Revenue in Thousands of Dollars
Urban Residential			
1945*	28,000,000	34,100	1,167,000

* Preliminary figures. * Revised figures.

Electric utility financing for 1945 amounted to an estimated total of \$1,322,253,000, exceeding the previous top-record year of 1936. The published record shows only four other times that the utility financing program went up into the billion-dollar bracket—in 1931, 1935, 1936, and 1944. Reason for the record refunding is revealed in a comparison of the average rates of yield of mortgage bonds and preferred stocks in 1945 and in recent past years. Bond yields decreased from 3.23 percent in 1943 to 2.92 percent in 1944 and to 2.77 percent in 1945. For preferred stocks, the yields were 4.44, 4.09, and 3.86 percent respectively. Investors were offered 70 electric utility issues as compared with 50 in 1944, including 47 issues of mortgage bonds, 12 issues of preferred stock, 8 issues of common stock, 2 issues of debentures, and

one series of notes. Utility financing also included new capital amounting to \$39,699,751, insignificant compared with the refunding figure, but twice as much as in 1944 and more than four times as much as in 1943. Institutional investors took about 9 percent of the utility bond issues as compared with 11 percent in 1944 and 41 percent in 1941.

For each dollar of gross revenue from the sale of electric energy, the electric utility industry reported the following disposition: For taxes, 22.8 cents; for gross dividends and surplus, 15.4 cents; for maintenance and miscellaneous operating expenses, 15 cents; for salaries and wages, 13.3 cents; for fuel, 13 cents; for depreciation, 10.8 cents; for fixed charges, 9.1 cents. During the past ten years, utility operating expenses have increased from 50.9 percent of total gross revenue from electric power sales to 64.2 percent in 1945, after taxes.

Operation. Fuel consumption for electric power generation for the 12-month period ending Oct. 31, 1945—including coal, oil, and gas—amounted to the calculated equivalent of 97 million tons of coal, as compared with the final figure of 103.92 million tons for 1944. Generating plant efficiency, expressed in the nation-wide average pounds of coal burned per kw-hr generated, remained at the 1944 figure of 1.33, reflecting the continued use of obsolescent plants and wartime fuels of uncertain quality. The actual fuel consumption in electric generating plants for the 12 months ending Oct. 31, 1945, as reported by the Federal Power Commission, was: coal, 77.03 million tons; oil, 19.42 million barrels; gas, 336.04 billion cu ft.; all for a coal equivalent of 97.2 million tons. Electric power generated from this fuel totalled 142,217,000,000 kw-hr from a total station capacity of 35,017,000 kw, representing an annual output of 4,023 kw-hr of energy per kw of installed capacity. Correspondingly, water power production was 80,150,000,000 kw-hr from an installed hydroelectric capacity of 14,884,000 kw, representing an average annual production of 5,437 kw-hr per kw of installed plant capacity.

Generating Capacity. Although the wartime priority and allocation controls exercised through the War Production Board were relinquished progressively, following the collapse of Germany in May, and essentially removed after the collapse of Japan in August, the effect of wartime conditions was definitely reflected in the fact that the net additional electric generating capacity completed during 1945 amounted only to some 712,000 kw, the smallest yearly increment since 1941. Nearly 90 percent of the increase was made in the Southern and Central regions, reflecting the expanding industrialization from wartime requirements. As of Jan. 1, 1945, additional generating plant capacity totalling 1,250,000 kw had been scheduled, but the unexpectedly rapid ending of the war cut that nearly in half.

As of the end of 1945, the total U.S. electric generating capacity was installed 70 percent in fuel-burning plants and 30 percent in hydroelectric plants. The corresponding electric power production was 63.8 percent and 36.2 percent. Of the 1945 total capacity, 80.5 percent represented privately owned utility properties and 19.5 percent local and Federal government bodies.

The 1946 budget for electric power developments in the United States was estimated at about \$900,000,000, within \$19,000,000 of the all-time high industry budget of 1930. To this estimate of the utility industry must be added approximately another \$100,000,000 for the 1946 expenditures on government-owned power facilities. Tentative di-

TABLE 3—ADDITIONS TO HYDROELECTRIC GENERATING SYSTEMS CAPACITY

Year	Fuel Plants or Systems			Total	Hydroelectric Plants or Systems			Grand Total of Fuel and Hydro
	Public	Private	No. Kilowatts		Public	Private	No. Kilowatts	
1945	6	100,500	21	521,100	27	621,800	31	887,400
1944	14	12,527	34	765,510	48	778,037	56	1,545,892
1943	7	144,700	42	1,090,480	49	1,835,100	49	2,924,080
1942	8	181,500	44	1,574,700	52	1,756,200	61	2,783,100
1941	22	188,000	63	2,104,100	85	2,292,100	102	3,078,300
1940	39	243,000	57	1,210,500	96	1,453,900	113	1,284,830
1934	94,700
1929	2,330,500

vision of this budget is: for fuel-burning power plants, 288 million; for hydroelectric power plants, 25 million; for electric power transmission facilities, 176 million; for substation facilities, 118 million; for power distribution facilities, 358 million; for miscellaneous plant improvements, 50 million. Corresponding capital expenditures for 1945, as tentatively reported at the close of the year, were: fuel stations, 106 million; hydroelectric stations, 13 million; power transmission facilities, 69 million; substation facilities, 47 million; power distribution facilities, 204 million; general plant improvements, 17 million; total, 456 million dollars. Additions to plant capacity in prospect for 1946 and later total 5.6 million kw-hr, of which 25 percent is to be in government plants.

Selected statistical data indicating the trend in additions to electric generating capacity are given in Table 3. Geographical distribution of the electric generating capacity of the U.S. after the close of 1945 is given in Table 4. The fact that the totals indicated in Table 4 for 1945 are slightly lower than the totals indicated in the corresponding YEAR BOOK for 1944 seems to indicate two things: First, a slight discrepancy in the figures reported by industry; second, the matter of obsolete power generating equipment that was put back into service to meet war needs.

TABLE 4—DISTRIBUTION OF ELECTRIC GENERATING CAPACITY REPORTED IN ELECTRIC UTILITY POWER PLANTS AT CLOSE OF 1945

Areas	Plants	Thousands of Kilowatts
6 New England states	313	3,197
3 Middle Atlantic states	372	10,432
5 East North-Central states	678	11,464
7 West North-Central states	893	3,485
8 South Atlantic states	392	6,502
4 East South-Central states	156	3,414
4 West South-Central states	406	2,669
8 Mountain states	419	2,634
3 Pacific states	294	6,105
Total United States	3,923	49,902

Rural Electrification. Reports of the Rural Electrification Administration indicate that the average REA customer used 1,525 kilowatt hours during the year, which he bought at an average rate of 3.45 cents per kilowatt-hour for an average annual bill of \$52.60. A total of 842 operating systems were reported in service as of the end of the year, servicing 1,391,100 customers, as compared with revised figures for 1944 showing 826 operating systems servicing 1,216,798 customers as of the end of 1944. A total of 453,900 miles of line were in operation at the close of 1945, as compared with 410,471 at the end of 1944, and 390,058 at the end of 1943. The number of generating plants increased from 65 at the end of 1944 to a total of 74 at the end of 1945, with the corresponding plant capacity of 94,600 kilowatts as compared with 76,500 kilowatts at the end of 1944, and 73,200 kilowatts at the end of 1943.

REA systems were reported to have generated 251 million kw-hr, and to have purchased an additional 2,350 million kw-hr to make up a total REA system input of 2,601-million kw-hr, approximately a 13 percent increase over 1944. The average number of customers per mile of line increased from 2.9 for 1944 to 3.07 for 1945.

Public funds that had been allotted to REA by the end of 1945 amounted to approximately \$668,950,000, representing \$595,200,000 in distribution lines, \$61,450,000 in generating and transmission facilities, and \$12,300,000 in consumer facilities. The revised total allotment for the end of the calendar year 1944 was reported as \$517,699,947. The Rural Electrification Administration started to move its offices and operating staff back to Washington from St. Louis, its wartime location dictated by Washington congestion.

TABLE 5—REA ESTIMATES OF U.S. FARMS YET TO BE ELECTRIFIED

	Farms without Central Station Electric Service, July 1, 1945		Allocation for Loans During Fiscal Year Ending June 30, 1946

United States	3,371,189	55.3	\$100,000,000

A total of 30,900 miles of rural lines were completed by private electric utilities against 10,933 in 1944, 3,962 in 1943, and 4,660 in 1942. A total of some 57,000 miles of rural lines is scheduled for 1946. The largest percentage of the 1946 mileage is scheduled for the New England states, with the South Atlantic, the West North-Central, and the West South-Central regions following. The reported 1945 rural-line construction budget was \$45,928,000; the estimated budget for 1946, \$80,507,000.

Government. As 1945 opened, Federal control of utility operation under war regulations administered by the Office of War Utilities of the War Production Board, were more rigorous than ever. After considerable heavy debate, a "brown-out" order was issued, drastically limiting the use of electric power for display purposes in most, although not all, areas of the U.S. The purpose was to conserve fuel where it was most critical. This brown-out order was lifted with the announced surrender of Germany. OWU reported that in the 3 months and 8 days during which it was effective, a total of 500,000 tons of coal had been saved, at a time when savings were critical. The industry calculated its contribution to the brown-out was a total reduction of more than \$48,000,000 in gross revenue for the period involved.

Almost immediately after the collapse of Germany in May, OWU progressively relaxed the various restrictions and limitations as rapidly as war and general industry conditions permitted. Essentially all controls were lifted immediately after the collapse of Japan in August. During the last week in September, OWU officially closed its doors, after 4½ years during which it and its predecessors had almost complete control over the broader phases of construction and operation of electric and other utilities.

The Tennessee Valley Authority stated at the end of 1945 that during the preceding year it had "produced more electric power than any other integrated power system in the U.S.," that its revenue for power sales exceeded \$39,000,000, and that its net income for the year was nearly \$18,000,000 or about 27 percent higher than for 1944. About three-quarters of the TVA power output went to war purposes, including such war industries as the huge atomic bomb plants at Oak Ridge, Tenn.

Reflecting a resurging interest of government agencies in the development of electric power, various proposals for "valley authorities" using the TVA as a model were discussed officially and semi-officially in Washington. Several proposals, including a huge proposed "Missouri Valley Authority," were before Congress at the end of the year. The attitude of the Administration was revealed in President Truman's statement in a Congressional message entitled "Public Works and National Resources": "... I hope that Congress will proceed as rapidly as possible to authorize regional development of the natural resources of our great river valleys. . . . We must harness our streams for the general welfare; we must rebuild and reclaim our land. . . . This is not only to provide men and women with work, it is to assure to the nation the very basis of its life. . . ."

With reference to such impending development of electric power with public funds, the electric utility industry promulgated a four-point policy:

1. All intended purposes—including flood control, navigation, irrigation, or power—should be revealed to the public when a government river project is proposed.

2. If power is produced at government-built

dams it should be sold to existing power systems without special privilege or discrimination, to avoid expensive duplication of facilities.

3. Any savings by this plan should be passed along to the users of electricity, under regulation by state commissions or other properly constituted regulatory bodies.

4. Government in any business endangers all business, because of government's inherent special privileges. Government should properly regulate business in the public interest, but should not operate business—the power business any more than the grocery business."

The year-end found the Federal Power Commission as one of the various Federal government agencies subject to the unknown possibilities of the President's reorganization program. The Commission's status as an independent agency, which it had enjoyed for 25 years, was considered to be in jeopardy, especially in view of the growing authority of the Department of the Interior.

1945 was a year of considerable conflict between the Federal Power Commission and the various State commissions. Usurpation of authority continued to be charged against FPC. In Arkansas, the Arkansas Power and Light Company requested a U.S. District court to decide between conflicting orders issued by FPC and by the State Public Service Commission, and the State Legislature endorsed an action of the State Commission against FPC. The New York State Commission challenged FPC authority in attempting to assert jurisdiction over seven gas utilities in New York State. In Montana, the State Commission attacked FPC conduct in a rate case of the Montana Power Company. In Maryland, the State Commission rejected FPC's theory of original cost in favor of determination of a fair value. In Connecticut, FPC efforts to bring Connecticut Light and Power Company under its jurisdiction as an interstate utility were stopped by a Supreme Court decision. Constitutionality of the famous "death sentence" clause of the 1935 Holding Company Act finally was argued before the U.S. Supreme Court in November, 1945. Although the court had not given its decision by the year-end, qualified observers expected the court to uphold the Act.

G. ROSS HENNINGER.

ELECTRONICS. Here is an industry that has come out of the war bearing gifts—many of them strange and fascinating, some of them dreams of the future, more of them down-to-earth practical tools that will serve the modern world and its industries.

Great improvements in aircraft radio, in mobile radio and in radio for use at sea are being founded on these same radio developments for war. Newly designed battle announcing systems insure vastly improved public address systems for peacetime use. Radar and intensive microwave development have set the groundwork for possible revolutionary improvements in radio and television broadcasting, and a host of other developments, large and small, are in great part the legacy of war's speeded-up engineering and research processes.

Industrial electronics likewise profits from war-accelerated research and production, with electronic heating, supersonic testing, and electronic welding of glass constituting just a few of the new developments to achieve prominence in 1945.

Radar. This now famous new word comes from the descriptive phrase "radio detection and ranging." Radar was the basis of the defense against aircraft attack, the new dimension in sea warfare that made possible whole naval engagements in

which not a single enemy ship is seen visually, and a long secret factor that made all-weather bombing possible.

As one of its achievements having commercial applications, radar at an airport can spot a plane 20,000 feet up in the clouds and 20 miles away, and provide to a radio operator in an airport control tower such accurate position information that the ground operator can guide the pilot to a safe landing entirely by radioed instructions.

Radar will be applied commercially to aviation and navigation, for it is a new all-seeing eye for the pilot, whether in the cockpit of a plane or on the bridge of a ship.

Radar Countermeasures. First came radar—then radar countermeasures for blinding enemy radar. These were of two general types: aluminum foil called window or rope, and electronic detectors and jammers.

Approximately 20,000,000 pounds of aluminum foil was dropped in Europe alone. It is an excellent radio reflector, returning a relatively strong radar echo in proportion to its size.

The strips are only a tiny fraction of an inch wide and a few inches long. A bundle of 6,000 strips weighs six ounces, and scattered from a plane, looks to a radar like three heavy bombers.

Electronic jammers operate on the simple principle of radio interference, creating false patterns that blot out desired targets on enemy radar screens. Electronic jamming of German radar from England was made possible by a new super-power high-frequency electronic tube called the *resatron*, which can by itself deliver 30 kilowatts of power continuously at a frequency of 500 megacycles.

The equipment consists of oscillators, noise modulators, and power supplies mounted in trucks, and a huge 150-foot long radiating horn constructed of chicken wire supported on telegraph poles.

Guided Missiles. Pilotless B-17 bombers loaded to capacity with dynamite and directed by radio, radar and television were hurled at very low level directly against U-boat bases. Each carried 11 tons of Torpex, an explosive many times more powerful than TNT. A pilot and co-pilot took each plane up to 10,000 feet over Britain and bailed out. Control of the bomber was then taken over by a mother plane, using radio to guide the giant bomber, radar to watch it through clouds, and television in the nose of the bomb-carrying plane to aid in aiming it at the target.

The first fully automatic guided missile, having the code name *Bat*, was directed by radar echoes from its target. Launched from Navy patrol bombers flying outside the range of the intended victim's guns, the *Bat* became completely automatic when released. Evasive maneuvers of the target ship were promptly followed. In using the *Bat*, the crew of the mother plane located the target, aimed the bomb initially at a particular ship or other target, and pushed the release button. The radar-guided bomb is approximately 12 feet long, has a 10-foot wing span, and carries a heavy explosive load. Its speed is comparable to that of a plane and its range great enough to allow the mother plane to operate well out of the enemy's longest-range anti-aircraft fire.

The *azon* bomb is a standard 1,000-pound demolition bomb with a radio brain that enables the bombardier to guide it by remote control. The accuracy of the bomb was particularly high. On seven missions in Burma fourteen bridges were destroyed by 150 *azon* bombs.

The Ghost Hellcat, a standard aircraft with complete radio control, was used as a target for the heavy anti-aircraft guns of the Fleet. Radio equipment moves ailerons, flippers and rudder, controls the throttle and power setting, retracts and extends the landing gear, sets the flaps, steers the tail wheel, works the wheel brakes individually, makes automatic fuel tank selection, and operates a smoke recognition device and fighting lights for night patrol. This pilotless plane is capable of taking off from a runway 150 feet wide by 2,000 feet long.

Drones are large powered model airplanes maneuvered entirely by radio from the ground, and used extensively as targets in training gun crews for light automatic anti-aircraft weapons.

The early TDD-3 drone is launched by catapult and recovered by parachute. It has a speed of 140 miles an hour, a 137-inch wing span and no landing gear.

The fast KDR-1 standard drone can also serve as opponent in dog-fight training of fighter pilots. Its 35-horsepower engine develops a top speed of about 190 miles an hour.

The TD2C-1 Kamikaze drone is capable of simulating high-altitude bombing runs, dive-bombing tactics, torpedo attacks and 300-mph suicide dive attacks.

The KDN-1 jet drone is regarded as a formidable sparring partner for fighter pilots and anti-aircraft gunners. Its 9.5-inch turbo-jet motor can provide speeds greater than 400 miles an hour in level flight. It is launched from a patrol plane.

Loran. An electronic system of navigation, a wartime military secret, makes available to commercial airlines and to surface craft the same exact navigation that carried military planes safely and directly to and from their targets in fair or foul weather. Harbor approaches may often be made at full speed under certainty of position within a few hundred yards. In rescue operations at sea, both the distressed ship and the rescue ship will be assured of exact position-finding regardless of weather conditions. (See SHIPPING.)

Proximity Fuze. The VT fuze, also called the proximity fuze because proximity to a target sets it off, is a self-powered radio transmitter and receiver small enough to fit into the nose of an anti-aircraft shell and tough enough to stand the terrific shock of firing. When the shell is fired, the shock smashes a glass container of electrolyte, which the spin of the shell forces into the plates of a battery. Current flows; the radio tubes light up; the transmitter broadcasts a continuous wave. When part of this is reflected back from an airplane 70 feet away, it interacts with the transmitted wave and trips an electronic switch, which shoots a current through the detonator. The shell explodes at the ideal distance for maximum effect. Similar fuzes were made for bombs, to explode them above ground.

Shoran. This was the most accurate system of bombing developed. Pinpoint accuracy permitted fragmentation bombs to be dropped through heavy overcast from 20,000 feet, to fall with demoralizing effect on invisible enemy troops entrenched only 400 yards from American lines. With shoran (*short range air navigation*) a bomb could be aimed at a 30-foot bridge invisible to the bomber because of overcast, and yet hit the bridge with greater precision than by visual bombing.

Radio Buoys. Anrac, which means aids navigation radio control, is a remote radio control system whereby the operator turns lighthouse lamps, foghorns, electric bell strikers and other navigational aids on and off by pressing a button miles away.

This remote control allows operation of aids only when they are necessary, thus conserving power.

The system consists of a control station transmitting specially coded ultrahigh-frequency signals to special receivers on buoys and other aids. The receiving equipment converts the signals to d-c pulses which open and close electric relays or gas valves to extinguish or relight lanterns or to trigger strikers.

Huff Duff. A radio direction finder of almost unlimited range, which Navy personnel call "Huff Duff," was revealed in 1945. The device is a high-frequency direction finder whose long range helped the Navy battle German submarines in the Atlantic, even more effectively than radar. In one instance, a 15-second message was picked up by 26 direction finder stations on both sides of the ocean.

Spherics. This is the name given to a new electronic technique that enables weather forecasters to plot the locations of distant storm centers across thousands of miles of ocean through the long-range detection of static electricity in thunderstorms, cloud masses, or rainfall. The term is a contraction of atmospheric, the word meteorologists use to refer to atmospheric electricity or static.

Spherics is based upon the principle that most atmospheric disturbances are accompanied by spheric discharges. When these are detected from a distance, they may be assumed to indicate the existence of a storm. The locations of spheric impulses are determined with a new type of radio direction finder that consists essentially of two crossed loop antennae, powerful amplifying circuits, and a cathode-ray oscilloscope. Flashes of light appear on the fluorescent screen at positions corresponding to the direction of the static source. When the direction of a static source is determined from two or more receivers, location of the storm may readily be plotted on a map by means of triangulation.

Industrial Applications. Just as electronics revolutionized warfare, so has it affected industry. The electron tube has brought new meaning to the word automatic in mechanical and electrical operations. No task is too heavy, too fast, or too precise for the tubes. They open doors; fire and dangerous fumes are detected by them. They sort, weigh, inspect, detect foreign material and flaws, and gage and count hundreds of items in factories.

In 1945, many useful applications of electronics were made in industry. One of the most spectacular of these, the first commercial vulcanizer in the rubber industry, was the installation of electronic heating equipment for the manufacture of Foamex mattresses at the Fall River, Mass. plant of Firestone Tire and Rubber Co. The machine is three stories high and uses 125 kilowatts of radio-frequency power to service two complete vulcanization chambers.

Double-bed mattresses that formerly required a 35-minute cure by the steam jacket method are completely cured by radio energy. In the conventional steam method, the foamed rubber is vulcanized slowly from the outside of the mattress to the interior. In this method, the process cannot always be precisely controlled. Parts of a steam-cured mattress may be completed and other parts of the same product under-cured. In the electronic method, heating is effected instantaneously and uniformly in all parts of the mattress, and close examination shows the final product is far superior to the old type.

Supersonic Inspector. Flaws and internal blisters only 0.001-inch thick in sheet steel, plywood, safety glass, plastics, automobile tires, and a host

of other materials can be detected and marked for rejection by a new electronic inspecting device that sends supersonic vibrations as rapid as 1,000,000 per second through the material under test. Piezoelectric crystals feed the supersonic energy in at one side of the material and pick it up on the other side. Detection and identification of a flaw may be indicated by a signal light or bell, on a meter, or with a relay which energizes a marking mechanism.

Electronic Blanket. A new electrically heated blanket is operated and regulated by electronic control. Two parallel conductors run throughout the interior of the soft, woolen bed cover, one serving as a heating element, the other as a sensitive feeler which operates through three electronic tubes in a control box to hold the blanket's temperature automatically to any desired degree of warmth.

Metal Heating. High-speed electronic heating on a production line has been established for case-hardening finished bearing pins to a depth of 0.025 inch. The pins are fed automatically through a glass tube and quenched with water as they leave the heating coil at a rate of 75 pins per minute. An electronic generator heats the surface of each pin above its critical temperature in less than one second. At this speed, the heat cannot penetrate into the core and only a thin surface layer undergoes change in physical state. The central portion of the pins retain all their original toughness and strength.

Sorting. By spraying electrical charges on low-grade ore, which contains only one and one-half percent tin, a new electronic ore separator extracts the metal from rock and sand, and concentrates it into an ore containing approximately 70 percent tin—suitable for smelting.

The ore is ground to the fineness of sand, dried, and then poured into a trough at the top of the separator. The particles of sand, rock and tin trickle onto a rotating metal drum, where they receive high-voltage electrical charges from a series of fine wires a short distance from the drum's surface. The tin particles are good conductors of electricity and the electrical charges seep through them and into the metal drum. The particles thus lose their charges before the drum has made more than one half turn and fall off the drum. The non-conducting sand and rock particles retain their charges and cling to the drum until pulled off during the second half revolution—by a series of oppositely charged wires. The electrostatic separator can sort mixtures of any two materials provided one component is a conductor of electricity and the other an insulator.

Highly polished steel balls, all within 1/20,000th of an inch of the same size, are sorted into groups of as many as ten size selections automatically by an electronic gage developed in 1945. The balls in any one group differ in diameter by only ten millionths of an inch, a precision more than adequate for the finest ball bearings. One operator handles four machines and sorts more balls than 32 skilled operators could do with conventional measuring equipment. The operator merely fills a hopper, and removes the sorted balls from their individual containers a few seconds later.

Snapshots. X-ray equipment which makes possible millionth-of-a-second x-ray photographs was used extensively in connection with the atomic bomb experiments. The new technique also contributed to the science of ballistics during the war by making possible such studies as determining the realignment of a bullet as it zipped down the bore of a gun barrel. Pictures of the swelling,

bursting and disintegration of a high explosive shell as it chewed through steel plate could also be obtained. Photographs of the original missiles were compared with several high-speed sequence pictures made as the bullet raced down the bore of the gun or as it entered the steel plate.

Typical of the amazing discoveries uncovered by high-speed x-ray pictures in ordnance experiments was one which cleared up the mystery of why certain armor-piercing bullets failed to penetrate. The reason, the pictures disclosed, was that the cap on the bullet, designed to break up the case hardening on the armor plate at the point of penetration, ripped free of the bullet after it left the barrel. Later the bullet caught up with the cap and shattered it just prior to reaching the target.

Electronic Eyes for Blind. Blind persons will be able to determine the color of traffic lights and detect the distance, within one foot, of obstacles, by an electronic device that is carried like a lunchbox and turned from side to side to scan the path ahead. The device projects a beam of light that is reflected by objects within a 20-foot radius. The reflection is detected by a photoelectric cell which creates coded tone signals in an earphone. The handle of the case is parallel to the direction of the first light ray, and the blind user can sense the position of his hand in determining the direction from which reflections are received. Development of the device was initiated by the Signal Corps as an aid to blind war veterans.

Television. The new supersensitive television camera tube called the image orthicon, developed in RCA Laboratories, was demonstrated in an exhibition showing how television has acquired an electronic eye so sensitive that it sees in candlelight, moonlight and twilight, or even in darkness with the scene illuminated by infra-red rays. This achievement solves major problems in television programming and in outdoor pickups, making possible 24-hour news coverage.

Pulse Time Modulation. A new technique known as pulse time modulation promises to improve telephone and telegraph service still further, by making use of an interesting fact about the human eye and ear. A motion picture is made up of a series of separate pictures, run off so fast that we see them as continuous and moving. On the same principle a series of pulse-like signals is sent out by the transmitter, with intervals of silence between the pulses. When these separate pulses are recombined in the receiver we hear them as a continuous sound. The result is that the transmitter is used for only an infinitesimal fraction of time to send a particular voice or program, and the time between pulses is available for additional signals. As many as 24 telephone messages can be transmitted at the same time by one transmitter on a single band of frequencies.

Citizen's Radio. In 1945 the Federal Communications Commission opened the way for wider use of certain special types of communication services which have heretofore been available only to a limited extent. One of these which has dramatic possibilities is Citizen's Radio, known during the war as a walkie-talkie and in a smaller version as a handie-talkie. By this plan, citizens may share frequencies on a cooperative basis and talk with one another by means of a portable device equipped with both a transmitter and receiver.

Highway Radio. This will provide two-way voice communication to drivers of motor vehicles. Citizens may for the first time have telephones in their automobiles, trucks or other moving units, which may connect with the general telephone system.

The subscriber to this service will have his car so equipped that he may talk with any one of the millions of telephones in the country or be called by any one of them.

Special operators at the central telephone office will handle calls to and from motor vehicles. If the driver of a moving van wishes to communicate with the manager of his company, he picks up his telephone and simply pushes a button which signals the operator in charge of vehicular service. She takes the number and, by way of wire, the signal travels to the party called. On the same principle, the manager may call his driver. He calls the operator and gives her the number of the van. She then sends out the signal on the proper radio channel by dialing the code number assigned to the vehicle. An audible or visible signal indicates to the driver that he is wanted. This service may be extended to include intercity trucks and buses as well as trains. Eventually two-way voice communication may be furnished to connect passengers or crewmen on trains, large buses, and even air lines with any telephone in the country.

Railroad Radio. Tests have proved that radio and communication from front to rear of trains, from train to train, from railway station to train can be used effectively. With radio, train crews will have an efficient means of instantly communicating with one another, thereby improving service, reducing the hazards of travel and saving life and property.

JOHN MARKUS.

EL SALVADOR. A republic of Central America. Area: 13,176 square miles. Population: 1,880,000 (1943). Capital: San Salvador.

Although much of the country is volcanic highland, there are fairly extensive lowlands along the Pacific coast and in the valley of the Rio Lempa, which cuts across the highlands. The mean annual temperature at San Salvador is about 73 degrees, while the mean annual range of temperature throughout the country does not exceed 50 degrees. Heaviest rainfall occurs between May and November.

Government. El Salvador's Constitution of 1939 provided for a centralized republic of 14 departments, with a unicameral legislature, the National Legislative Assembly, of 42 members. The Assembly met regularly twice a year, Feb. 15 to May 15, and Oct. 15 to Jan. 2. The President was directly elected and was assisted by a Cabinet of 5 members. An amended version of the Constitution of 1886 was adopted on Nov. 30, 1945, to replace the 1939 Constitution. The President is Salvador Castaneda Castro.

The People. El Salvador is the most densely populated country in Central America. Inhabitants per square mile range from 87.4 in the Department of Chalatenango to 292.2 in the Department of San Salvador. Mestizos constitute 80 percent and Indians 19 percent of the total population. The largest cities are: San Salvador, 105,000; Santa Ana, 48,000; and Nueva San Salvador (Santa Tecla), 24,000.

Spanish is the official language, Roman Catholicism the predominant religion.

According to the census of 1930, 21.2 percent of the population is literate. In 1941, 89,792 students were enrolled in 1,330 primary schools; 3,309 in 58 secondary schools, and 506 in the National University.

National Economy. El Salvador is primarily an agricultural country. Coffee is the principal export crop, but substantial quantities of corn, sugar, beans, rice, cotton, and henequen are raised for

domestic use. The 1944-45 coffee crop was estimated at 920,000 bags (of 60 kilograms each).

Gold and silver are the principal mineral products of El Salvador. In 1944 gold production amounted to 23,110 troy ounces valued at \$799,393; silver production totaled 276,284 troy ounces valued at \$122,645. There is little manufacturing, but a number of small industries are engaged in processing agricultural products, and produce manufactured articles for the domestic market.

Foreign Trade. Coffee is the chief export product of El Salvador, which ranks third among the coffee-exporting countries of Latin America. In 1944-45 coffee exports totaled 997,539 bags of 60 kilograms each, of which about 90 percent went to the U. S. Gold and silver rank second in importance in the country's export trade. Other exports are sugar, rice, and henequen sacks. In 1943 coffee represented 87 percent of the value of total exports; gold and silver accounted for 6 percent. The U. S. is the most important market for El Salvador's exports, and took 80 percent of the total in 1943.

The U. S. is the leading supplier of Salvadoran imports, and in 1943 provided 69 percent of the total imports. Manufactured and semi-manufactured products, foodstuffs, and beverages form the major imports of the country.

In 1942 imports amounted to 21,432,000 colones, and exports totaled 44,928,000 colones.

Events, 1945. El Salvador opened the year with elections in prospect for Jan. 14-16. A President and Vice President, and three deputies and three alternates from each department were to be elected. Originally there had been six presidential candidates in the race. Three dropped out before the end of 1944. On Jan. 7 Napoleón Viera Altamirano, candidate of the Republican Social Front, announced his withdrawal, and Antonio Claramount Lucero followed suit a few days later. This left only Salvador Castaneda Castro, who had the backing of the Osmín Aguirre Administration.

Both Viera and Claramount charged that the administration intended to impose the election of Castaneda Castro. Provisional President Aguirre denied this in a broadcast on Jan. 11. He promised to guarantee free and impartial elections; declared that the Government had tried to prevent the withdrawal of all other candidates and was not trying to force Castaneda Castro on the country; and added that he would suppress any attempt against public order.

The election was held without incident. Castaneda Castro and his Vice-Presidential running-mate, Adriano Villanova (a last-minute substitute for former Ambassador to the U. S. Hector David Castro), received 312,754 votes, Provisional President Aguirre received 2,030, and all former candidates received a total of 1,050.

The exiled oppositionist, Arturo Romero, called upon all the American democratic governments not to recognize the Government of Castaneda Castro, "born by the imposition of bayonets." But prominent members of the Democratic Union of Central America, which had been opposed to the Aguirre regime, expressed the belief that the election had been legal and voiced the hope that the new administration would achieve peace and progress. And the President-elect, in a post-election statement, declared that he would establish a Government of conciliation, develop public instruction, tolerate no obstruction to peace and public order, and conduct no political persecution. He invited all "good" Salvadorans living outside the country to return. The Communists were excluded from the proffered amnesty; Castaneda Castro said he would

govern democratically with the collaboration of all but the extreme leftist parties. A provisional National Assembly was inaugurated on Feb. 1, to function until the new Administration took office on Mar. 1; at that time it became a Constituent Assembly and started to draft a new Constitution.

There were rumors of unrest at various times during the month, and on Feb. 13 the Minister of the Interior admitted that there had been some minor revolutionary movements against the Aguirre regime.

The provisional Government had not been recognized by the other American republics nor had it been invited to the Mexico City Conference. The inauguration of Castaneda Castro brought general recognition, however, and a Salvadoran delegation was seated at Mexico. The Salvadoran Government-in-exile had ceased to exist the day before.

In his inaugural address, Castaneda Castro pledged that freedom of expression and other civil liberties would be fully guaranteed and that there would be "effective conciliation without partisanship." In the field of foreign affairs, he said he would seek to "maintain and intensify our cordial relations with Central American countries as well as the rest of the continent."

There were two attempted revolts against the new administration during the summer. A Government communiqué on June 10 disclosed the shooting down of an airplane used by discontented army officers to bomb and machine-gun national police barracks. The Constituent Assembly imposed a state of siege, but the official statement claimed that the Government had known of the uprising in advance and that complete order prevailed throughout the nation.

The Government announced on July 31 that "13 army officers of low rank" were involved in a plot which had been frustrated the week before. They were said to have been backed by civilian elements opposed to the administration and to have had money and a quantity of hand grenades. The authorities also seized a clandestine radio station, said to be broadcasting "subversive propaganda and alarmist reports" in the town of Santa Ana. The rebels were reported to be using food scarcities and unfavorable economic conditions as reasons for overthrowing the Government.

At the end of November the Constituent Assembly abandoned its attempts to write a wholly new constitution and restored instead an amended version of the 1886 Constitution. Important amendments included a law against reelection of the President after a four-year term; legal recognition of certain autonomous institutions set up with public funds; provisions for labor arbitration; postponement of election of mayors until 1946; establishment of social security and minimum wage laws. President Castaneda Castro hailed the work of the Assembly as "opening the door to interior peace," and pledged himself to a policy of national consolidation "in the democratic spirit."

During November, a Central American-Mexican coffee parley was in session in San Salvador. Its apparent purpose was to set up a federation which would serve as a hemisphere "coffee front" to work for changes in United States price and import policies. All the coffee-producing countries of Latin America had been agitating for a higher price, claiming that increased production costs were making the coffee industry uneconomical. A subsidized 3-cent-a-pound increase authorized by the U. S. failed to satisfy them.

Relations with Guatemala preoccupied the Salvadoran Foreign Ministry during much of the

year. Provisional President Aguirre had closed the Guatemalan-Salvadoran border and in retaliation, Guatemala halted all railroad traffic, thereby setting up a virtual economic blockade which prevented the export of Salvadoran coffee and the receipt of urgently needed imports. Late in January Guatemalan newspapers described the situation as extremely tense.

It was improved by the new Salvadoran Administration, however. The border was reopened on Mar. 10, and on May 17 the Presidents of the two countries held a cordial meeting at the border, and brought up the old project for a union of Central American countries, on whose "urgent need" they agreed. Both Presidents made simultaneous broadcasts on May 22, in which they explained that the political sovereignty of each country would be preserved under their plan but that they would be drawn together culturally and economically. On June 22 Guatemalan and Salvadoran commissioners were reported to have signed an economic-financial protocol leading toward gradual fusion of their economic life. There was opposition to union however, both within Guatemala and El Salvador, and in the other Central American states, and no further progress seemed to have been made by the end of the year; a projected second meeting of the two Presidents was never held.

HARRY B. MURKLAND.

EMERGENCY MANAGEMENT, Office for (OEM). The Office for Emergency Management was established in the Executive Office of the President by administrative order of May 25, 1940. The agency is primarily a framework within which various civilian war agencies have been established, and during the war it served as an important means of organizing the war program. It was subjected to many changes in organization during the last half of 1945 and now consists of the following: the Committee on Fair Employment Practice, the Office of Alien Property Custodian, the Office of Defense Transportation, the Office of Scientific Research and Development, and the War Shipping Administration. Chairman: Malcolm Ross.

EMPLOYEES' COMPENSATION COMMISSION, U.S. An independent bipartisan agency of the U.S. Government which administers the legislation providing workmen's compensation benefits for civil employees of the United States and covering also private employment within the jurisdiction of the Federal Government. Chairman: Mrs. Jewell W. Swofford.

ENGLAND, Church of. The most important religious event of a year of reports and planning was the publication on June 19 of *Toward the Conversion of England*, the final report of the Archbishops' Commission on Evangelism. The report analyzed the spiritual and psychological needs of the age with special reference to postwar England; stressed the limitations of scientific education; pointed out the need for evangelism by trained laymen; and advocated the use of modern propaganda media, including cinema, drama, radio, television, press, literature, Christian information and publicity centers, and advertising.

Apart from the solemn observances of V-E Day and V-J Day; from the enthronement on April 19 of Dr. G. F. Fisher as Archbishop of Canterbury and Primate of All England; and from the extensive arrangements for welcoming back demobilized men and women to their parishes, the chief events were the publication of three other reports.

The final report of the Financial Commission, which was published on September 18, and presented to the Church Assembly in November, proposed that a special committee should be appointed "to investigate the possibilities of combining all those bodies, including the Ecclesiastical Commissioners and Queen Anne's Bounty, which deal with the financial resources of the Church centrally, into one Treasury," so that control of the central resources of the Church should be "vested in a body upon which there would be adequate representation of the Church Assembly, combined with considerable saving in administrative expenses."

Other recommendations included a minimum of £500 per annum for beneficed clergy "where the work and responsibility justify it"; a Central Appeals Advisory Committee; and a proposal that at least £1,000,000 for Church Training Colleges should be included in central needs during the next ten years.

In October the Archbishop of Canterbury assigned an over-riding priority to the need to raise £600,000 for the training and assistance of ex-Service and other candidates for the Ministry, of whom 4,000 were then on the register. It was revealed that the appeals launched by 34 dioceses totalled £11,410,000.

The Report *Training for Service* recommended a new central theological college for women; a Refresher College for voluntary workers; and a determined effort to recruit women, especially university graduates and holders of responsible posts in national service, for Church work.

Saving the Art Treasures of the Church, the 9th Report of the Central Council for the Care of Churches, revealed that, save in a few special categories such as Renaissance architecture, the destruction of the Church's art treasures during the course of World War II was far less than had been feared.

Dr. J. W. C. Wand was translated from the bishopric of Bath and Wells and appointed Bishop of London.

During December, Archbishop Lord Lang of Lambeth, a former Primate, died.

Events of the year included a decision to raise £250,000 for Christian Reconstruction in Europe; an appeal by the Archbishops of Canterbury and York on October 10 for £100,000 for the Anglican Church in China, which had turned to the Church of England for help; and an intensive campaign to recruit missionaries—including teachers, doctors, nurses, radiologists and other technicians—for the Church overseas. It was decided to re-build Coventry Cathedral in association with an inter-denominational centre for Christian social work.

ENGRAVING AND PRINTING, Bureau of. A Bureau of the U.S. Department of the Treasury which designs, engraves, and prints the U.S. currency and other engraved work for governmental use. Director: Alvin W. Hall.

During the fiscal year ended June 30, 1945, the Bureau delivered 842,229,242 printed sheets, of which 117,795,283 were currency aggregating \$8,436,340,000 in face value and weighing 2,800 tons.

ENTOMOLOGY AND PLANT QUARANTINE, Bureau of. A Bureau of the U.S. Department of Agriculture, which studies insects that are injurious or beneficial to agriculture and forestry, develops new insecticides and fungicides, etc., and enforces quarantine and restrictive orders issued under the Plant Quarantine Act. Chief: P. N. Annand.

ERITREA. An Italian colony on the west shore of the Red Sea, incorporated in Italian East Africa on June 1, 1936, but under British Military Administration since its conquest by Allied forces in 1941.

The People and Their Economy. The population of some 700,000 lives in an area of 15,754 sq. mi., though they tend to congregate on the central plateau, where the climate is cooler and moister. On this plateau live the Christian (Coptic) element, racially and linguistically akin to the Ethiopians. In the lower regions dwell various peoples, largely Hamitic and Moslemized. In the cities and towns on the coast Arab communities are found.

The only port of any importance is Massowah. The capital is Asmara (7,765 feet above sea level) where there is still a considerable Italian population. A railway leads from Massowah through Asmara almost to the Sudan frontier. There is also a system of highways, some of them built or improved during the 1935-36 campaign against Ethiopia. After 1941 the Americans and British made good use of Eritrea's communication and industrial facilities for the prosecution of the campaign in Libya. Relatively little trade originates in Eritrea since the colony produces only a few exportable items such as hides and salt. The transit trade—from the Sudan, Ethiopia and lower Arabia—is also of only minor importance.

Events, 1945. The Council of Foreign Ministers which met in London in September was supposed to draft a treaty of peace for Italy. Claimants for the Italian colonies therefore presented their cases at that time. Both Egypt and Ethiopia asked for Eritrea, the latter on historical and ethnic grounds. However, when the Soviet delegation indicated an interest in obtaining a trusteeship for Eritrea, as well as for Libya, the Conference decided to postpone settlement of this issue. Meanwhile the American delegation revealed that it had proposed that Eritrea be given independence after a ten-year interim trusteeship arrangement under the United Nations Organization. Ethiopia, however, was to receive a territorial cession giving her access to the sea at Assab. The Italian Government continued to plead that it not be deprived of its pre-fascist colonial possessions.

The British Military Administration was accused of keeping a number of notorious fascists in office in Eritrea, and of perpetuating some of the racially discriminatory regulations imposed during the Italian regime. On Sept. 25 there took place in Addis Ababa mass demonstrations demanding the return of Eritrea to the Ethiopian "motherland." (See ETHIOPIA.)

ROBERT GALE WOOLBERT.

ETHIOPIA. An empire in northeast Africa, comprising the Abyssinian highlands and adjacent lowland areas to the east, south and west. Its area is around 350,000 square miles—some of the country's boundaries have not yet been delimited exactly. Addis Ababa (population 200,000) is the capital. Other important cities are Harar, Dire Dawa, Gondar and Dessye.

Government. Ethiopia merits the title of empire because it consists of several ancient kingdoms (such as Tigré, Amhara, Shoa and Gojjam) and comprises peoples who are alien in race and culture to the politically dominant Abyssinians of the plateau. The creation of this empire was the work of several generations, reaching its apogee under Emperor Menelik II (1889-1913).

The political and social structure of Ethiopia is still largely feudal, though the present ruler—Emperor Haile Selassie I—has been making some

headway against the entrenched conservatism of the aristocracy and the clergy. At least a nominal modification was introduced into the system of absolute monarchy when in July, 1931, Haile Selassie decreed the creation of a Parliament. This body, first convened in November, 1932, consisted of two houses—a Senate and a Chamber of Deputies—all of whose members were nominated and whose functions were merely advisory. The Senate consisted of 27 members chosen from the hereditary chiefs of the provinces, while the Deputies were selected by the Emperor from among civil and military officials. There was also an Imperial Council, with the Emperor acting as his own Prime Minister.

Ethiopia was overrun by Italian troops in 1936 and annexed to Italy. Eritrea and Somalia were joined to it in order to form Italian East Africa, administered by a Viceroy representing the King-Emperor in Rome. This came to an end when Allied forces reconquered the country and restored Haile Selassie to his throne (May 5, 1941). The boundaries as of 1935 were supposedly also restored, though the territorial provisions of the eventual treaty of peace with Italy may alter them somewhat. After a brief period of British military administration, Ethiopia recovered her complete sovereignty *de jure* and became one of the United Nations. Still under British military administration is the Ogaden and certain "reserved areas" around Harar. Since his return from exile, Haile Selassie has resumed the process of strengthening the central administration, headed by a prime minister. He has also called in numerous experts from Britain, the United States and elsewhere to give advice in various technical fields. He has further sought to create a corps of trained Ethiopians, especially from among the younger men, who will be loyal to him rather than to the feudal chiefs, and on whom he can rely to modernize his state.

During the fiscal year 1943-44 (ending September 10) the Ethiopian budget was balanced at 38,956,058.74 Maria Theresa thalers. Revenues were set at 31,702,599.91 (including a 5,000,000 subsidy from the British Government) and expenditures at 33,472,740.67. The 1944-45 budget contained comparable figures.

A new Ethiopian army is being created to provide a modern defense force that can operate more quickly and effectively than the old provincial feudal levies. It has been trained by British officers, as has the newly formed police force. Equipment consists of old Italian arms, British materiel and Lend-Lease items from the United States. The new army, including regulars and territorials, is said to comprise some fifty battalions.

Events, 1945. The text of the Anglo-Ethiopian Agreement signed on December 19, 1944, was published in London on January 12 as a White Paper (for a brief resumé of the terms of this Agreement see the YEAR BOOK for 1944, page 200). The general reaction of the British press was that the new convention removed most of the objectionable features of the 1942 Agreement and that the Ethiopian Government now enjoyed virtually complete freedom of action in both its internal and external affairs. The principal exception was the continued British military administration of the reserved areas and the Ogaden.

On his return from the Yalta Conference Mr. Roosevelt stopped over briefly in Egypt to confer with several of the monarchs of Near Eastern countries, including the Emperor Haile Selassie of Ethiopia. At this meeting, which took place aboard an American cruiser in the Great Bitter Lake of the

Suez Canal, subjects of mutual interest were discussed. However, the outside world was given only the following laconic official communiqué:

"In talking with the Emperor, the President stressed communications between the United States and Ethiopia and said he hoped, with improvements of communications, particularly by air, the two countries would come to know each other better. The Emperor told the President of the many improvements recently made in Abyssinia and enthusiastically indorsed the President's hope for closer relations.

"The President took advantage of the opportunity to thank the Emperor in person for the site and buildings he and the Empress gave the United States to use as a legation in Addis Ababa."

During his brief visit in Egypt the Emperor also had a talk with Prime Minister Winston Churchill. It was assumed that Haile Selassie took this occasion to reiterate Ethiopia's demands for the annexation—or "return"—of the Italian colonies of Eritrea and Somalia and for a share in any eventual reparations that might be extracted from Italy by the victorious Powers. On this point the official Ethiopian position has always been that Abyssinia was the first of the nations overrun by the Axis Powers and that she was therefore entitled to first consideration in such matters as indemnities and the trying of fascist war criminals. In regard to the latter issue there did not appear to be much chance that Ethiopia would receive satisfaction for her demands that Italian leaders in the war of 1935–36 like Badoglio be haled before an international tribunal.

On the eve of the Big Five Conference of Ministers which met in London during September and October, the Ethiopian Government once again officially pressed its claims to Eritrea and Somalia. At this Conference one of the first items on the agenda was the drafting of a treaty with Italy which would inevitably have involved the future of Italy's East African colonies. However, the Conference was thrown into such an uproar when it became known that Russia was requesting control over Libya and perhaps even Eritrea, that the Ministers decided to put the Italian treaty over until a later meeting, thus leaving the allocation of the East African colonies undecided.

The British were naturally very apprehensive at the possibility that Russia might gain a foothold on the Red Sea along their lifeline to India. As for the United States, the proposals put forward by its delegation for the solution of Italian territorial problems were made public in London on Sept. 22. According to this statement, the United States had suggested that Eritrea be granted independence after a ten-year probation period during which it would be under a United Nations Organization trusteeship arrangement. There was, however, to be a territorial cession which would give Ethiopia access to the sea through the port of Assab. In the case of Italian Somaliland there was no fixed term during which the trusteeship arrangement would run. (See ERITREA, SOMALILAND.)

On Sept. 6 it was revealed by Mr. H. F. Sinclair, President of the Sinclair Oil Corporation, that his firm had obtained a fifty-year concession for the development of oil resources in Ethiopia. During the first five years this concession was to cover the entire area of the country; but thereafter the area in which the Sinclair company would have exclusive rights would be gradually diminished. The corporation was given the exclusive right "to explore, prospect and drill for, extract and render suitable for trade" petroleum and its derivatives,

as well as to dispose of any oil which the company may produce under this agreement.

Among the more unusual features of this contract were the obligations assumed by the Sinclair company to promote the general welfare of the country by devoting part of its profits to the building of schools, hospitals, "clinics, sanitary facilities, research organizations, and other public institutions for the enhancement, education, health, culture and prosperity of the people of the country." The agreement specifically provides that for a period of ten years the company shall spend certain sums for the training and education of Ethiopian subjects in the United States.

Whether any oil actually exists under the soil of Ethiopia has long been a disputed question. It will be recalled that just prior to the Italian invasion of Ethiopia in 1935 an oil concession was granted by the Ethiopian Government to certain American interests, principally the Standard Vacuum Oil Company. Thanks to the intervention of the American State Department and the success of Italian arms, this concession never got beyond the paper stage. If there should prove to be oil in Ethiopia the government of the country will be entitled, under the Sinclair contract, to royalty payments on a stipulated basis for the first five years, and thereafter at an increased rate subject to revision at the end of fifteen years from the date when actual production shall have begun.

Characteristics of the Population. Estimates of Ethiopia's population vary widely, for there has never been a proper census. The actual figure is probably somewhere around eight or ten million.

The Amharas, who have long constituted the ruling element in the empire, probably number less than 3,000,000. They speak various derivatives of the ancient Ge'ez, a Semitic language introduced from Southern Arabia. Amharic, the most widely used of these modern tongues, is the official language of the Imperial Government. However, various other languages are spoken by the majority of the people: Galla, Somali, Danakil, Arabic, etc.

The Amharas are Coptic Christians, as are some of the Gallas. The Somali, Danakil, many of the Gallas, and some of the peoples of southwest Ethiopia profess Islam. A number of pagan tribes are also found in the latter region. The city of Harar is the center of Moslem culture for the entire Horn of Africa.

The Coptic Church is politically powerful and owns considerable tracts of land. The clergy is numerous, and in the aggregate represents a force opposing progress. Hitherto the Abuna, or head of the Ethiopian Church, has always been an Egyptian appointed and consecrated by the Coptic Patriarch of Alexandria. However, the Ethiopian Government announced in May, 1944 (see YEAR BOOK for 1944) that when the incumbent Abuna Qirillos had ceased to reign, his successor would be appointed by the Emperor. The connection between the Egyptian and Ethiopian branches of the Church was severed entirely during the Italian occupation. Non-Christian religions are not only tolerated, but the Government supports several Mohammedan schools.

Elementary education is provided, primarily for boys, by government and mission schools in the principal cities. So great had been the disruption wrought by the Italian occupation that Ethiopia's educational facilities have had to be rebuilt virtually from the ground up. Many of the educated young men were killed by the Fascists as a matter of policy. In September, 1944, there were 79 elementary schools in operation, with 289 teachers.

The six central schools in Addis Ababa had 1,386 pupils, while the four at Harar, Dessye and Jimma had 1,562. In addition there were secondary, teacher training, technical and commercial schools in the capital. Higher education is just getting under way, but considerable progress is anticipated since this matter is very close to the heart of the Emperor.

The Economy of the Country. Ethiopia is far from being a rich country. Few minerals have been found under her soil outside of small amounts of gold and platinum. From time to time explorers and promoters have reported the discovery of deposits of coal, iron and oil (see **EVENTS** above). There is considerable potential water power in the rivers, notably the Blue Nile, but this can be harnessed only by sinking large amounts of capital—and the Ethiopian Government has been loath to open the country to foreign speculators. Several years ago the J. G. White Company of New York surveyed the power resources of the Blue Nile, but the Italian invasion cut short any development at that time. Parts of the ancient forests, for which the Abyssinian plateau was noted, may still be found in some of the more inaccessible regions.

Stock-raising and agriculture form the main occupations of the people. Both are conducted on rather primitive levels except where European influences have made themselves felt. The nature of the products naturally varies according to climate, altitude and other environmental factors. Cattle and sheep are found in the highlands, camels and donkeys in the lowlands. Cereals are raised widely. Very little agricultural produce is exported, each region being largely self-sufficient. The Ethiopian Ministry of Agriculture provided the following estimates in 1945: wheat, 1,700,000 hectares and 420,000 tons of grain; barley, 1,000,000 hectares and 800,000 tons; maize, 1,500,000 hectares and 1,800,000 tons; giant millet, 3,000,000 hectares and 4,500,000 tons; cattle, 12,000,000; sheep and goats, 2,000,000; horses and mules, 2,000,000; camels, 500,000. The principal exports are coffee, hides and skins. Imports consist largely of cloth and other manufactured articles. For 1943-44 the exports were valued at £2,184,108 and the imports at £3,910,090.

Ethiopia, being without a coastline, must find outlets for her meager trade through other countries. The only railway goes from Addis Ababa to Jibuti in French Somaliland, a distance of 486 miles. It is owned and operated by a French company. One of the few benefits conferred by Italian rule was the construction of new roads. In 1935 the highways totalled 2,730 miles. The Italians improved these and added 4,340 more, of which 1,732 were macadamized and 1,401 asphalted. They also built a number of airports, thereby opening up remote and inaccessible parts of the country. One of the problems facing the Ethiopian Government at present is how to keep these roads and airports in repair.

ROBERT GALE WOOLBERT.

EUROPE. A continent with an area of about 2,079,000 square miles (excluding European U.S.S.R.) and a population estimated at 402,550,000 (excluding the population of European U.S.S.R.) on Jan. 1, 1940. See the article on each European country.

EVANGELICAL AND REFORMED CHURCH, The. A denomination formed by the merger in Cleveland, Ohio, on June 26, 1884, of the Evangelical Synod of North America and the Reformed Church in the

United States. The highest judicatory is the General Synod, which meets triennially. A new Constitution was declared in effect at the meeting of the General Synod, held at Lancaster, Pa., in 1940. In 1942 a new Book of Worship and Hymnal were formally adopted by the General Synod while in session at Cincinnati, Ohio. The officers of the Evangelical and Reformed Church are: President, Rev. Dr. L. W. Goebel, 77 W. Washington St., Chicago 2, Ill.; First Vice President, Rev. Dr. John Lentz; Second Vice President, Mr. Edward Dirks; Secretary, Rev. Dr. William E. Lampe, 1505 Race St., Philadelphia 2, Pa.; Treasurer, Mr. F. A. Keck, 1720 Chouteau Ave., St. Louis 3, Mo.

In its combined statistics for the year 1944, the Evangelical and Reformed Church reports a membership of 689,780 in 2,824 congregations. Total expenditures for congregational purposes amounted to \$10,778,625, and total benevolences to \$2,637,857. The Sunday School enrollment is 414,382.

EXECUTIVE OFFICE OF THE PRESIDENT. An office of the executive branch of the U.S. Government which included in 1945 the following divisions: The White House Office; Bureau of the Budget; Liaison Office for Personnel Management; Office for Emergency Management and the War Refugee Board. See separate articles.

EXPERIMENT STATIONS, Office of. An Office of the U.S. Department of Agriculture, whose functions date back to 1888. It administers Federal funds provided under various acts for the support of research in agriculture, the rural home, and rural life by experiment stations in the several States, Alaska, Hawaii, and Puerto Rico. Chief: James T. Jardine.

EXPORT-IMPORT BANK OF WASHINGTON (EIB). Created in 1934, the bank was made a permanent independent agency of the U. S. Government by the Export-Import Bank Act of 1945, approved July 31, 1945. The purpose of the Bank is to aid in the financing of exports and imports between the United States and foreign countries.

The Act of 1945 vested the management of the Bank in a board of directors consisting of the Secretary of State and four full-time directors appointed by the President by and with the advice and consent of the Senate. It also authorized an increase in the limit on outstanding loans and guaranties from \$700,000,000 to \$3,500,000,000 and removed the prohibition on loans by the Bank to governments in default on their obligations to the U. S. Government.

This increase in the lending authority of the Bank has permitted it to extend long-term reconstruction credits to liberated and war-devastated countries to assist them in purchasing from the United States the equipment, materials and services required for the restoration of their economies. Largely because of credits of this type, the cumulative total of authorized loans of the Bank from the date of its creation increased from approximately \$1,200,000,000 at the end of 1944 to more than \$2,300,000,000 at the end of 1945. Disbursements during 1945 were approximately \$80,000,000 and repayments were approximately \$51,000,000. As a consequence, the outstanding loans of the Bank increased from \$225,000,000 at the end of 1944 to \$252,000,000 at the end of 1945.

In addition to its reconstruction loans, the Bank continues to finance the foreign trade of the United States in two other principal ways. It finances specific export and import transactions on applica-

tion of United States exporters and importers, where the nature of the risk involved is such that private credit can not be obtained. It also makes long-term loans to assist in financing the export of United States materials and equipment required for development projects in foreign countries.

AUGUST MAFFRY.

EXTENSION SERVICE. An agency of the War Food Administration, U.S. Department of Agriculture, established under the Agricultural Appropriation Act of 1924. Its functions are educational. An administrative and subject matter staff headed by a State director of extension work is located at each land-grant college, and county extension agents are located in nearly all the agricultural counties. These county extension agents make available to farmers, farm homemakers, and rural youth the results of research conducted by the Department of Agriculture, the land-grant institutions, and other research agencies, adapted to local farm and home conditions.

The Extension Service, as a cooperative educational agency, carried on general wartime food educational programs with rural people and in urban areas where cooperation with other agencies could stimulate food production and conservation as in the case of Victory Gardens. The Extension Service administers and supervises the intra-state aspects of the wartime farm labor program, including direct action through the State extension services in the recruiting and placing of farm labor (men, women, and youth) from local, urban, and interstate sources; the establishment of farm placement centers; the training of workers; and other phases of the emergency farm labor program.

Director of Extension Work: M. L. Wilson.

FAEROES. A group of 21 islands (the chief being Bordo, Kalso, Osterø, Sando, Stromø, Suderø, Vaago, and Videro) north of Scotland, forming a county of Denmark. The islands were under British military control from Apr. 10, 1940, until August, 1945. Total area, 540 square miles. Population (1935 census), 25,744. Capital, Thorshavn (on Stromø), 3,611 inhabitants. The chief exports are fish, whale oil, woolen goods, lambskins, and feathers. The islands are administered by a Danish governor and the local parliament (Lagting). The election held in the Faeroes, according to a report of Nov. 7, 1945, resulted in a victory for the pro-government coalition. This means that the Faeroes will remain with Denmark.

FAIR EMPLOYMENT PRACTICE. Committee on. Originally a Committee established by executive order within the Office of Production Management (see YEAR BOOK for 1941) on June 25, 1941, and transferred to the War Manpower Commission on July 30, 1942. This Committee ceased to exist upon the establishment of a new Committee on Fair Employment Practice within the Office for Emergency Management on May 27, 1943.

The purpose of the Committee is to promote the fullest utilization of all available manpower and to eliminate discriminatory employment practices. Executive Order 9346, by which it was established, provided that all agencies of the U.S. Government include in all contracts a provision obligating the contractor not to discriminate against any employee or applicant because of race, creed, color, or national origin. Federal agencies concerned with training for war production were required to assure that such programs are administered without discrimination. The Committee is empowered to re-

ceive and investigate complaints of discrimination, to conduct hearings, make finding of fact, and take appropriate steps to obtain elimination of such discrimination. Chairman: Malcolm Ross.

FAIR FOUNDATION, The Maurice and Laura. A Foundation which concentrates its funds in support of economic research through grants to research organizations for investigations of specific problems which are basic to the development of American industry, trade and finance. During 1945, payments approximating \$350,000 were made on grants for this purpose. New grants of \$69,100 were voted in 1945. Economic research projects completed during 1945 resulted in the publication by the Brookings Institution, Washington, D. C., of "Postwar Fiscal Requirements," "Should Price Control Be Retained?" and "Labor Policy of the Federal Government"; by the National Bureau of Economic Research, New York, N. Y., of "Labor Savings in American Industry, 1899-1939"; and by the Committee on Postwar Tax Policy of "A Tax Program for a Solvent America." The Foundation was established by Mr. Maurice Falk in 1929 with the provision that principal as well as income should be used within 35 years for such efforts to advance the general welfare as the Foundation's Board of Managers might select. Executive Director: J. Steele Gow. Chairman of the Board of Managers: Leon Falk, Jr. Offices: Farmers Bank Building, Pittsburgh 22, Pa.

FARM CREDIT ADMINISTRATION (FCA). An agency of the U.S. Department of Agriculture (q.v.), established under authority of the Farm Loan Act of 1916 and subsequent acts, to provide a complete and coordinated credit system for agriculture. It makes long-term and short-term credit available to farmers and also provides credit facilities for farmers' cooperative marketing, purchasing, and business service organizations.

The United States is divided into 12 farm credit districts. In one city in each district are a Federal land bank, a Federal intermediate credit bank, a production credit corporation, and a bank for cooperatives. Activities of the four institutions in a district are coordinated through a farm credit board and an executive called the general agent, who acts as joint officer for the four units.

Federal land bank loans are long-term, amortized loans of \$100 to \$50,000 made to farmers who give as security first mortgages upon their farms. Corporations engaged in raising livestock are also eligible to borrow, under certain limitations. The rate of interest for most new loans is 4 per cent. Land bank commissioner loans up to \$7,500 may be made for the same purposes as land bank loans and also to refinance indebtedness. The contract rate of interest is 5 per cent. The 12 Federal intermediate credit banks make loans to, and discount paper for, production credit associations, the banks for cooperatives, State and national banks, agricultural credit corporations, livestock loan companies, and similar financing institutions. The 12 production credit associations provide credit for all types of farm and ranch operations, the loans being made and collected by local associations. The central and 12 district banks for cooperatives make loans to farmers' cooperative associations; loans are of three types—commodity at 1.5 percent interest; operating capital, 2.5 percent; facility, 4 percent.

Emergency crop and feed loans of from \$10 to \$400 in one year are made to applicants who are unable to procure adequate loans from other sources.

es. Regional Agricultural Credit Corporations were organized to provide emergency short-term credit in 1932-33; during 1943 RACC loans were made to finance the production of essential wartime food and fiber, and in 1944 and 1945 loans were authorized in certain regions on all crops and in some regions on specified crops, as designated by the Secretary of Agriculture.

The FCA maintains a Cooperative Research and Service Division, and it also works with other government agencies in meeting wartime problems. Governor in 1945: I. W. Duggan.

FARM SECURITY ADMINISTRATION (FSA). An agency of the U.S. Department of Agriculture, established as the Resettlement Administration in 1935. It has made loans to nearly one million farm families for the purchase of machinery, equipment, livestock, seed, fertilizer, and other supplies. Since the war loans (up to five years at 5 per cent) have been made primarily to increase the production of essential food and fiber. The loans are accompanied by technical guidance from county supervisors. The FSA also aids in the group purchase of machinery and purebred sires and in the setting up of county-wide group health services. Under the Farm Tenant Act of 1937, loans are made for the purchase of family-type farms, \$233,750,000 having been authorized for this purpose up to June 30, 1944. The migratory labor camps originally established by FSA have been turned over to the War Food Administration for the use of seasonal workers, and the resettlement projects are being liquidated by sale of the units to residents. Rehabilitation loans totaling \$3,338,213 had been made to 2,635 veterans by July 31, 1945. The agency was delegated by the Secretary of Agriculture to process loans and grants, totaling \$2,000,000, to farmers whose property was damaged by the floods of 1945.

On instructions from Congress, the agency began liquidation of its 152 rural resettlement projects. By June 30, 1945, 71 projects had been sold or transferred to other agencies. Administrator: Frank Hancock.

FEDERAL BUREAU OF INVESTIGATION (FBI). This Bureau, established in 1908 by Attorney General Charles J. Bonaparte, is the investigative arm of the Department of Justice. It was originally called the Bureau of Investigation, the present name having been adopted in July, 1935. The present Director of the FBI was appointed in 1924 by Attorney General Harlan Fiske Stone, and has been reappointed by each succeeding Attorney General.

The jurisdiction of the Federal Bureau of Investigation extends generally to all federal crimes not specifically assigned to another agency of the Federal Government. Specifically it is charged with the duty of investigating violations of the laws of the United States, collecting evidence in cases in which the United States is or may be a party in interest, and performing other duties imposed upon it by law.

The headquarters of the FBI are located in the Department of Justice Building in Washington, D.C. In addition to its administrative offices it maintains in Washington its Identification Division, the FBI Laboratory, the National Academy, and its Uniform Crime Reporting facilities.

The Identification Division maintains the largest number of fingerprint records in the world. The number of fingerprints received in this division has increased from 87,918 in the fiscal year 1924 to 26,776,184 in the peak year of 1943. In the 1945

fiscal year 7,480,249 sets of fingerprints were received. An over-all picture of the growth of the Identification Division from 1924 to 1945 can be seen from the fact that in 1924 there were 810,188 prints in possession while in February, 1946, there were 100,000,000.

The FBI Laboratory was established in September 1932, as a scientific aid in crime detection. Here competent scientists are constantly working on evidence submitted by law enforcement agencies throughout the United States and in addition are conducting research to further aid law enforcement. Over one million examinations have been made by the laboratory. During the fiscal year of 1945, 136,098 examinations were conducted involving 194,445 specimens of evidence.

The FBI National Academy, founded in July, 1935, is concerned primarily with the training of police instructors and administrators. Applicants for attendance are carefully selected from local, county and state law enforcement agencies. The course of instruction consists of various phases of law enforcement with special emphasis placed on methods of teaching and organization of police schools within their own departments. Among the graduates of the Academy are representatives from every state in the Union, from some of the United States Territorial Possessions, and from several foreign countries. To date 1,125 selected officers have graduated from this school.

In its Uniform Crime Reporting project the FBI, at the request of the International Association of Chiefs of Police and pursuant to an Act of Congress, acts as a central clearinghouse for police statistics on a nation-wide basis. Monthly and annual crime reports forwarded to the FBI reflecting information as to the number of persons arrested, the number found guilty and related crime data, are summarized and published in the Uniform Crime Reports bulletin. The bulletin, which is published semi-annually, also contains information concerning the age, sex, race and previous criminal history of persons arrested throughout the United States as reflected by the fingerprint cards received in the Identification Division.

Wartime Duties. In September, 1939, the President designated the FBI as the clearinghouse for all matters concerning national security. This Presidential Directive placed the responsibility for handling matters pertaining to espionage, counter-espionage, sabotage, subversive activities, and violations of the neutrality laws under the jurisdiction of the FBI. In December, 1941, and July, 1942, by Presidential Proclamation the Bureau was made responsible for the apprehension of alien enemies in continental United States, Puerto Rico and the Virgin Islands.

Internal Security Matters. During the fiscal year 1945 the FBI, under the Alien Enemy Control program, apprehended 290 alien enemies—219 Germans, 68 Japanese, and 3 Italians. Closely connected with this program is the denaturalization of naturalized citizens of enemy countries who use their citizenship as a cloak for subversive activities. Based upon FBI investigations the citizenship of nine persons was cancelled during the 1945 fiscal year. Five hundred cases coming within the purview of the sedition statutes were investigated. During this same period, 3,093 convictions resulted from prosecutions under the Selective Training and Service Act, with sentences totaling 8,551 years, 9 months and 19 days. Fines imposed aggregated \$92,634.

As a result of investigations conducted by the FBI there were 2 convictions for misprision of

treason and 3 convictions under the general conspiracy statute for giving aid and comfort to German prisoners of war who had escaped from internment camps in the United States. Violations of the Espionage Statute resulted in 10 convictions with sentences totaling 89 years and 6 months and 2 life imprisonments and recoveries amounting to \$106,853 were realized.

During the 1945 fiscal year 3,081 reports of suspected sabotage were reviewed. Of the cases resulting in prosecution there were 45 convictions in Federal Courts. Sentences totaled 146 years, 2 months and 17 days. Fines of \$3,850 were levied. Investigation revealed that no person responsible for acts of sabotage was foreign-directed or motivated by a desire to obstruct the war effort. Culprits were prompted, generally, by personal reasons such as jealousy, anger or a desire for revenge.

General Criminal Investigations. Both during and since the cessation of hostilities in World War II, the FBI has continued to give close attention to its responsibilities in the general criminal field.

Eighteen kidnappings occurred during the fiscal year ending June 30, 1945. All of these were solved and there was no demand for ransom in any case. There were 34 convictions in Federal Courts resulting in sentences totaling 507 years, 2 months and 16 days. In addition, 22 fugitives sought for violation of the Federal Kidnaping Statute were located. Since the enactment of this law on June 22, 1932, to the close of the 1945 fiscal year, 279 kidnaping cases were investigated by the FBI and 277 of these were solved. The two remaining unsolved cases are still under active investigation.

Since 1932 a total of 577 convictions for kidnaping have resulted from prosecutions in Federal and State Courts with sentences of 6,475 years, 9 months and 9 days. In addition, there have been 44 life sentences and 12 death sentences, while 8 kidnapers have been killed resisting arrest, 7 have been murdered by other gang members, 2 have been lynched and one was declared insane.

During the 1945 fiscal year 7,892 stolen motor vehicles valued at \$6,402,439 were recovered in cases investigated by the FBI. This figure represents a decided increase over the 1944 fiscal year. Two thousand, four hundred and eighteen convictions resulted from prosecutions under this statute with sentences aggregating 7,384 years, 8 months and 7 days. In addition, fines of \$18,112 were reported and 840 fugitives were located.

A sharp increase was noted during the fiscal year in the number of violations of the several Federal statutes relating to theft, embezzlement and illegal possession of government property. Prosecutions resulted in 1,815 convictions with sentences of 2,836 years, 11 months and 25 days. Fines amounted to \$139,364, while recoveries totaled \$267,550.

For the fiscal year ending June 30, 1945, frauds against the Government showed a steady increase. From the cases investigated 344 convictions resulted with fines of \$228,624 being imposed. Recoveries and savings amounted to \$3,697,800 while sentences totaled 450 years, 7 months and 27 days.

Federal Bank Robbery Act. Since the enactment of the Federal Bank Robbery Act on May 18, 1934, a total of 1,051 bank robberies have been investigated. There have been 748 convictions in Federal Courts with sentences totaling 11,941 years, 3 months and 27 days, 2 death and 14 life. Six bank robbers have been killed resisting arrest, 3 committed suicide and 5 were adjudged insane.

During the fiscal year 1945 FBI investigations resulted in 53 convictions in Federal Courts for bank robbery, larceny and burglary. Total sentences

of 434 years, 3 months and 5 days were imposed and fines and recoveries amounted to \$58,004. Two bank robbers were killed resisting arrest.

Servicemen's Dependents Allowance Act of 1942. This Act makes possible the prosecution of women who fraudulently receive allowance checks from the government under the pretext of being legally married to a serviceman. In some instances women have married several soldiers, marines, sailors or members of the Coast Guard without legal dissolution of one or more previously contracted marriages.

There were 215 convictions resulting from investigations conducted during the 1945 fiscal year with sentences of 488 years, 3 months and 10 days. Fines in the amount of \$9,698 were imposed. FBI investigations also made it possible for the government to secure the repayment of \$34,177 by persons wrongfully receiving allowances.

In addition to the foregoing, such statutes as the White Slave Traffic Act, Impersonation Statute, Crimes on Indian and Government Reservations, National Stolen Property Act, Federal Extortion Statute and many other Federal criminal statutes are under the jurisdiction of the Federal Bureau of Investigation.

Over-All Statistics. During the fiscal year 1945 there were 13,813 convictions in cases investigated by the FBI with sentences totaling 31,962 years, 4 months and 6 days, 1 death sentence and 6 life sentences. Fines, savings and recoveries amounted to \$16,534,436, a total of 8,955 fugitives were located and 7,892 automobiles were recovered. The percentage of convictions of persons brought to trial was 96.9.

J. EDGAR HOOVER.

FEDERAL COMMUNICATIONS COMMISSION (FCC). During the calendar year 1945, the Federal Communications Commission laid the regulatory groundwork for the development of new types of radio broadcasting and for other important radio communication services.

The foundation of all subsequent expansion of radio communications was the Commission's reallocation of frequency bands in the radio spectrum. Wartime technological developments, particularly the invention of more powerful tubes, had extended the usable portion of the spectrum from 300,000 kilocycles to 30,000,000 kilocycles. This afforded an opportunity for the expansion of old services and the introduction of various new ones.

After lengthy public hearings and conferences, in which the Commission received extensive aid from the Radio Technical Planning Board, representing industry, the Commission ordered a reallocation of frequencies from 25,000 kc to 30,000,000 kc.

Frequency Modulation (FM) broadcasting, characterized by its ability to transmit the full range of tones and by its freedom from interference, had made a small start before the war. Because of its superior quality, the Commission was convinced that it would rapidly supplement standard broadcasting (AM or amplitude modulation) and perhaps eventually largely supplant it. For this reason, the Commission moved FM from 42-50 megacycles to 88-108 mc, where it could be assigned 100 channels each 200 kc wide, capable of accommodating more than 5,000 stations and where, in the opinion of the Commission, superior service would be possible. Twenty of these channels were reserved for noncommercial educational stations.

Regulations governing FM standards of good en-

engineering practice and a plan for the nation-wide allocation of channels were issued by the Commission toward the close of the year. The allocation plan provided channels for some 1,500 metropolitan and rural stations. In addition, it was estimated that channels could be allocated for some several thousand low-powered community stations.

At the close of the year, the Commission had issued conditional permits to 230 of nearly 800 persons or companies who had applied for FM channels. The existing FM stations were under orders to begin broadcasting on the higher band by Jan. 1 or as soon thereafter as possible.

Television's advance had been even more modest when wartime restrictions froze construction. Only six commercial stations and three experimental stations were operating. In allocating bands for the postwar future, the Commission was confronted with the problem of assigning space "downstairs" in the spectrum for immediate development of television along prewar lines in which there had been marked improvement, or moving it "upstairs" for the future development of black and white pictures of higher definition, and color pictures.

The Commission finally decided to allocate 13 channels below 300 megacycles for immediate commercial operation, and to allocate the 480-920 mc area for experimentation with a system of superior black and white pictures and color pictures. Television's eventual home in the spectrum is expected to be in the higher frequencies where there is space for the wider channels required for better television pictures and for the greater number of channels needed to establish a truly nationwide and competitive system. Active experimentation in this higher region was urged by the Commission.

At year's end, the Commission established television as a full-fledged commercial broadcasting service by issuing rules, standards of good engineering practice and an allocation pattern covering the first 140 metropolitan districts of the nation. In a number of districts there were more applications on hand than there were available channels. In these areas, the Commission was to hold hearings to determine which of the applicants were best qualified to operate the stations. All told, 150 applicants had filed for channels at the end of the year.

The 106-108 mc band in Area II (outside the northeastern section of the country) was reserved for commercial facsimile. The 470-480 mc band was reserved for experimental facsimile. In addition, facsimile experimentation is permitted on the regular FM channels.

A band was allotted for the Citizens Radio-communication Service—a personal type of radio service employing a low-power, short-range transceiver of the walkie-talkie or handie-talkie type. Bands were also provided for Rural Telephone Service, Industrial and Medical Service and Limited Private Telephone Service. Another new service, the proposed General Mobile Service for motor vehicles and other land, air and marine mobile units was provided for but before establishing it on a permanent basis, the Commission decided to issue a limited number of experimental licenses to determine the best operating plan. The new Railroad Radio Service was established, effective Dec. 31. The first experimental license for the civilian use of radar, for which several bands were set aside, was issued Dec. 13. Allocations above 25,000 kc also provided channels for many other previously established services. A proposed report on allocations below 25,000 kc had not been made final at

the end of the year. One of the proposals was to enlarge the standard broadcast band by adding the 540 channel. Amateur radio operators in good standing who had been silent since the beginning of the war were permitted to return to the air Nov. 15 on certain bands.

Broadcasting. A general public hearing to determine what changes, if any, should be made in the present policies on allocation of clear channels in the standard broadcast band was ordered by the Commission for Jan. 14, 1946. A report on a survey of the attitudes of rural listeners was released by the Commission, in connection with preparations for this hearing. In approving the sale of the Crosley radio properties to the Aviation Corporation of America, the Commission announced a plan whereby all interested parties would be given an opportunity to apply for licenses of stations offered for sale, that it would recommend that Congress consider adopting a yardstick to measure the appropriate value of a station, and that it consider further defining the qualifications of licensees—particularly to determine as to what extent large companies should be permitted to control radio stations. At the end of the year, 939 standard broadcast stations were operating, 65 additional ones were under construction and 520 applications for new stations were pending.

Common Carrier. Reductions in interstate telephone rates made during the year following negotiations between the Commission and the American Telephone and Telegraph Company will save users \$41,000,000 annually. Substantial savings also were assured when the Commission authorized a 20-cent word basic rate on full-rate messages to Europe, Central America, West Indies, South America and the Philippines from U. S. gateway cities and a uniform full rate of four cents a word for transmitting international full rate messages overland to or from any point in the United States beyond the gateway city.

Sharply reduced rates between the United States and British points were agreed to at the Bermuda Telecommunications Conference of United States and British Commonwealth delegates held in the fall of 1945. These reductions are to go into effect by April 1, 1946. An agreement was also reached at this Conference for the establishment on a permanent basis of certain direct radio circuits to British points. The Bermuda Conference was a highly significant contribution toward the movement for a fuller and freer flow of communications and to international understanding and cooperation.

Other Activities. The Foreign Broadcast Intelligence Service of the Commission was transferred on Dec. 31 to the War Department. This Service was established in 1941 to provide the various interested agencies of the Government with rapid reports on foreign radio broadcasts. Its reports, some transmitted by direct wire and others in mimeograph form, were based on a careful examination of several millions of words heard daily. At the time of transfer to the War Department, the FBIS maintained listening posts in Washington, D.C.; Portland, Oregon; Hawaii and Guam and also exchanged reports with the British Broadcasting Corporation.

The Commission's Radio Intelligence Division (RID), notable for its wartime service of patrolling the ether for espionage radio transmissions has continued to maintain a round-the-clock surveillance to guard against any misuse of the airways, to locate illegal operators, to track down sources of interference to legitimate radio communications

and to furnish directions to airplanes that had lost their way.

PAUL A. PORTER.

FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA. An organization established in 1908 by 28 Protestant denominations to act for them in matters of common interest. At the end of 1945 it included most of the major Protestant denominations of the United States and also three branches of the Eastern Orthodox family. The total number of members included in the Council's constituency in 1945 was 28,000,000.

The Council continued its ministry to men and women in the armed forces and to those returning to civilian life, but it gave special attention to problems of world order. In January it held a national conference of church leaders to consider ways of strengthening the movement for world order. Amendments were suggested to the Dumbarton Oaks proposals and educational work was planned in preparation for the San Francisco Conference. The Council sent consultants to San Francisco and, along with other religious groups, was influential in securing the inclusion in the Charter adopted for the United Nations Organization of provisions regarding human rights and fundamental freedoms.

During the year plans were formulated for a comprehensive relief and reconstruction program through the churches in Europe and Asia. Dr. Samuel McCrea Cavert, the General Secretary of the Council, was loaned to the World Council of Churches for six months, to work at its headquarters in Geneva in helping to develop its program, especially in the field of reconstruction and relief in Europe.

The resumption of fellowship with the churches of Germany and Japan was promoted by the sending of deputations to both these countries.

A statement was issued on the control of the atomic bomb and upon the need of moral and spiritual disciplines in the new atomic age. In line with this statement, the Council's program of visitation evangelism was strengthened and also its radio ministry.

In the field of race relations, the Council held interracial clinics in some sixteen cities, bringing the various groups in the community together under church auspices to study the causes of tensions and to formulate plans for improving conditions.

The Council continued to hold interdenominational conferences on family life, on religion and health, on Christian social work and on public worship.

The *Information Service* was published weekly as an analysis of social, international and interracial problems of special interest to the churches. The *Federal Council Bulletin* (monthly) is the official organ of the Council. Other publications are: *Interracial News Letter* (bi-monthly), *Town and Country Church* and *Post-War World*.

Officers in 1945 were: President: Bishop G. Bromley Oxnam; Vice President: Dr. Benjamin E. Mays; Treasurer: Harper Sibley; General Secretary: Rev. Samuel McCrea Cavert. National offices are at 297 Fourth Avenue, New York 10, N. Y. An office is maintained in the Woodward Building, Washington 5, D.C.

FEDERAL DEPOSIT INSURANCE CORPORATION (FDIC). An independent agency of the U.S. Government, organized under the Banking Act of 1933 to insure the deposits of all banks which are entitled to the benefits of insurance under the law. The major

functions of the Corporation are to pay off the depositors of insured banks closed without adequate provision having been made to pay claims of their depositors, to act as receiver for all suspended national banks and for suspended State banks when appointed by State authorities, and to prevent the continuance or development of unsafe and unsound banking practices. The Corporation may also make loans to or purchase assets from the insured banks when such loans or purchases will facilitate a merger or consolidation and will reduce the probable loss to the Corporation.

The capital stock of the Corporation is as follows: (1) by the Treasury of the United States, \$150,000,000; (2) by the Federal Reserve Banks, \$139,299,556.99. On June 30, 1945, the surplus of the Corporation amounted to \$579,200,000 and total capital account to \$703,055,000. Of the 14,206 operating commercial banks and trust companies in the United States and possessions, deposits in 13,282 banks were insured by the Federal Deposit Insurance Corporation. Of the 545 mutual savings banks, 192 were insured by the Corporation.

Federal credit unions, cooperative associations organized in accordance with the Federal Credit Union Act, were transferred to the Federal Deposit Insurance Corporation Apr. 27, 1942. On June 30, 1945, there were 3,800 Federal credit unions in operation. Share balances in credit unions are not insured by the Corporation.

Chairman in 1945: Leo T. Crowley.

FEDERAL POWER COMMISSION (FPC). An independent agency of the U.S. Government, first established in 1920, which has jurisdiction over water power projects on navigable streams or affecting interstate or foreign commerce, or upon public lands, and over the interstate movement of electric energy. It also regulates the transportation or sale of natural gas in interstate commerce under the Natural Gas Act. The Commission exercises emergency powers in wartime, including that of interconnecting and coordinating power facilities where essential to the war effort. Chairman in 1945: Leland Olds, Acting.

FEDERAL RESERVE SYSTEM. An agency of the U.S. Government established in 1913 for more effective supervision of banking in the United States and for other purposes. The System comprises the Board of Governors; the Federal Open Market Committee; the 12 Federal Reserve Banks and their branches situated in different sections of the United States; the Federal Advisory Council; and the member banks, which include all national banks in the United States and such State banks and trust companies as have voluntarily applied to the Board of Governors for membership and have been admitted to the System. Chairman in 1945: Marriner S. Eccles.

FEDERAL SECURITY AGENCY (FSA). An agency of the U.S. Government which was established July 1, 1939, as a result of the Reorganization Act passed by the Congress earlier in that year, to promote "social and economic security, educational opportunity, and the health of the citizens of the nation." It brings together Government agencies having related responsibilities in these broad fields. As the Agency is presently constituted, its component units are the Public Health Service, under which is Freedmen's Hospital; the Office of Education; the Social Security Board; the Food and Drug Administration; the Office of Vocational Rehabilitation; and Saint Elizabeth's Hospital. It also represents Federal participation in the work

of Howard University, the Columbia Institution for the Deaf, and the American Printing House for the Blind. (See separate articles on the first five of the component agencies.) The affairs of the Federal Security Agency are under the direction and supervision of the Federal Security Administrator. He is assisted by the Assistant Administrator, who acts as Administrator in his absence, and by a staff of administrative, special, and technical assistants who aid in the activities and correlation of the different units of the Agency. Within the Office of the Federal Security Administrator and functioning as integral parts of that office are the Office of Community War Services and the Office of War Property Distribution.

Office of Community War Services. This office was established to promote cooperative effort between the Federal Government and local communities in the provision of essential services to citizens of war-burdened towns and cities—health, medical care, welfare, education, recreation, social protection, and related areas of community well-being. The fiscal year 1944-45 threw into new perspective the operations of this office.

During the early part of the year the production effort to achieve victory was greatly intensified. Strains upon the physical resources of communities increased and strains upon workers and civilians were intensified. Family dislocations continued and multiplied. At the close of the year units of servicemen were returning for demobilization or redeployment; the wounded were being brought back in large numbers. Some training camps were closed, others which had been closed were reactivated. Industries and munition plants producing for war needs reduced their output. Boomtowns like Willow Run became ghost towns, their vast plants closed. The greatest migration in our history started in reverse. All this caused new community tensions; racial conflicts flared; the problems of youth became more acute. Venereal disease and prostitution, which had been held in check by war restrictions, spread a widening threat over the nation.

Before the close of the fiscal period V-E day had come and V-J day loomed on the horizon. Within this complex of change and readjustment the Office of Community War Services, as the war arm of the FSA, carried on its appointed task of helping war areas to meet the problems imposed upon them. Organization already effected to do the job was strengthened and geared to the rapidly changing situation. A few new facilities were established but the main goal was to help communities hold the gains already made, while they adjusted to the unending processes of production, and the problems of deployment.

The major functions of the Office are to serve as a custodian of certain properties and programs and as interpreter and liaison agent between Federal agencies charged with certain war responsibilities and local communities in which these responsibilities must be carried out. In that capacity it has maintained continuously up-to-date information on localities where the war has caused serious dislocation; analyzed and made known the facts; and helped mobilize the proper resources to meet the situation. This in some instances means helping communities to discover their own resources, helping them to get effective local community organization of interested agencies, lending the specialized services of the Office of Community War Services staff, interpreting acute local problems to interested Federal agencies concerned with such problems as housing, transportation, health, welfare, recreation, social protection, juvenile delinquency, food and

eating facilities, fuel and ice, commercial services (stores, laundries, banks, personal services).

The work in communities is based on complete reports and surveys—more than 649 basic reports of 364 war areas having been made. During its history representatives of the Office have worked in 2,500 communities. In the three last months of the fiscal year intensive work was carried on in an average of more than 300 communities and the number varied during the year from 200 to 300 a month.

No expansion of activities could be planned as the fiscal year drew to a close. Rather, since the Office was specifically set up as a war agency, curtailment in personnel, expenditures, and program had to be anticipated. On the other hand, communities were already beginning to look beyond the dislocations of war with an idea of gearing the experience and progress they had made into greatly expanded postwar plans. The Office was called upon to help them in this transition.

Recreation Division. The Recreation Division, acting within the framework of the general responsibilities of the Office of Community War Services, is concerned with helping communities to maintain the health and morale of servicemen, war workers and their families, and young people through recreational activities. In the beginning of the program the services of the Recreation Division were centered mainly in military areas, but later the problems of war workers and their families in war-burdened communities became of increasing concern. The demands of youth pressed for attention in the face of growing delinquency and the inadequacy of services in communities to keep adolescent boys and girls from becoming war casualties.

More than 2,500 communities have been helped to carry their load through services and facilities provided by the Recreation Division. It has the responsibility of supervision of 1,700 USO centers and 1,200 independent servicemen's centers. Much of the work in these centers is carried on by volunteers who must be trained and checked constantly. The Recreation Representatives have a responsibility for the character of these services. USO and local centers were reduced by only 15 to 20 per cent during the year. A growing responsibility arose in connection with 106 Army and Navy general hospitals and 23 convalescent areas. Recreation interests for ambulatory patients, information centers, housing and eating facilities for the families and friends of the patients created demands upon the Recreation staff.

As agents of the Federal Works Administration the Office is responsible for the protection and proper use of 454 Federal recreation buildings, representing a cost of more than \$30,000,000, some in the vicinity of military camps, others in housing projects and war production communities. As populations shift and use of some of these buildings falls off, a new responsibility to aid in their disposal so that they serve the best need of communities is an important one facing the Division.

The Recreation Representatives have helped industrial plants to provide recreation programs for their employees. Approximately 6,000 plants now have such programs.

The Division has had a growing responsibility to help communities provide constructive recreational interests for youth and has played an important part in fostering the more than 3,000 youth centers which have been established over the country. The Recreation Representatives conducted a questionnaire survey of more than 300 of these teen-age

clubs, the results of which are published in a pamphlet.

The Division has helped communities to establish permanent tax-supported recreation programs. Approximately 250 towns and cities have established recreation departments since the war.

A major responsibility of the Division has been the encouragement to States to create State Recreation Committees and Departments to aid communities in developing their programs. Twenty-three State committees have been organized and four States now have permanent Recreation Departments established by legislation.

As war problems have revealed the need for continuing recreation plans in communities, the Recreation Representatives have been called upon to advise and help develop long-range plans. In many instances these plans involve war memorials in the nature of parks and playgrounds, community recreation centers, beach areas and swimming pools. In general, members of the Recreation staff have helped communities to foresee and adjust to the transition from war to peace in respect to their recreation programs.

Social Protection Division. During the fiscal year 1944-1945, rapid adjustment to meet the changing war situation and approaching peace keynoted the program of the Social Protection Division, which was established to help communities carry out the Federal Government's policy of preventing and repressing prostitution and controlling the venereal diseases.

During the war years, commercial prostitution was effectively repressed and the spread of venereal disease was controlled, in the vicinity of military concentrations, through cooperative effort on the part of the Army, Navy, U.S. Public Health Service, and the Social Protection Division. V-E day and the approaching end of the war brought a serious threat of the re-opening of houses of prostitution and general relaxation of repressive measures in many communities. Upon request of mayors and chiefs of police, Social Protection Representatives spent an increasing amount of time revisiting communities to forestall such contingencies.

At the end of the fiscal year, venereal disease rates in the Army and Navy were more than double the 1942 figure. It was estimated that 40 per cent of the infections occurred while servicemen were on furlough, making it evident that a serious problem lay outside of military areas. The furlough problem made it necessary to shift the attack from service cities to communities over the country. A broader attack upon the program, consequently, was essential. State-wide boards composed of concerned officials and citizens were organized shortly after V-E day by the field staff. To implement the program on the local level, emphasis was placed upon over-all community organization aimed at combating the combined evils of prostitution, promiscuity, and venereal disease. Local Social Protection Committees were organized and existing committees strengthened.

Sustained community programs, including participation by officials in the fields of law enforcement, health, welfare, and education, as well as supporting citizen groups, had been developed in 215 communities by the end of the fiscal year. In 500 additional communities, houses of prostitution had been closed, making a total of 715 communities where social protection programs had been established.

The Social Protection Division continued to work in close cooperation with the Army, Navy, U.S. Public Health Service, in Washington as well as

with their District or Regional offices. The Division cooperated with other Federal agencies having a concern in the program, such as the Children's Bureau of the United States Department of Labor, the FBI and Bureau of Prisons of the U.S. Department of Justice, the Bureau of Public Assistance of the Social Security Board, and the Office of Education of the FSA. The Division maintained close relationship with the American Social Hygiene Association and its affiliated societies.

The Division continued to enlist the cooperation of national, regional, State, and local organizations representing such business interests as the American Hotel Association, Conference of Alcoholic Beverage Industries, Allied Liquor Industries, Distilled Spirits Institute, U.S. Brewers' Foundation, American Motor Hotel Association, Inc., and affiliated State and local tavern organizations, the National Association of Taxicab Owners and the American Taxicab Association, as well as labor organizations of waiters and bartenders. These organizations put into practice self-policing policies which had been developed jointly with them by Social Protection Representatives. *She Looked Clean—But*, a pamphlet designed especially for this type of organization, was published as a means of convincing these groups of the need for and value of social protection.

Acceptance and public support of the social protection program by the general public continued to be developed through the various national lay organizations representing veterans' groups, women's clubs, labor unions, racial groups, chambers of commerce, and community chests and councils.

The Social Protection Division continued to call on its several national committees for assistance in developing a nation-wide program. These included the National Advisory Police Committee; the National Sheriffs' Association; the Committee on Courts and Wartime Social Protection of the American Bar Association; the National Venereal Disease Committee, composed of physicians, educators, and the clergy; and the National Women's Advisory Committee on Social Protection, whose members represent the outstanding women's clubs and service groups.

Extending its activities into the field of social treatment, the Division cooperated with public welfare departments and private family agencies in several experimental projects designed to develop better methods of social treatment of promiscuous women and girls. Agencies throughout the country were encouraged to adopt the methods thus learned.

Office of War Property Distribution. This office was established to carry out the Federal Security Agency's responsibility in the disposal of surplus war properties. Divisions of Surplus Property Utilization were established in the two constituent units of the agency concerned—the Public Health Service and the Office of Education.

The Federal Security Agency's part in the disposal and distribution of surplus property is to act as liaison between the Federal disposal agencies and the States, communities, and non-profit organizations which are in line to apply for the available property on a basis of need. The institutions eligible include publicly supported and non-profit schools, hospitals, clinics, libraries and similar institutions. Provision is also made for other types of non-profit institutions. On applications approved by the FSA such institutions may purchase property from disposal agencies at the "fair value," which in practice will be the lowest price for which the property is sold at any commercial level.

The Division of Surplus Property Utilization set up in the Public Health Service works with State and local health officers to help them determine community needs and to make application for war property, and the similar Division in the Office of Education performs the same services for school officials.

WATSON B. MILLER.

FEDERAL TRADE COMMISSION (FTC). An independent agency of the U.S. Government, established in 1914, which has the following threefold purpose: To promote free and fair competition in interstate trade in the interest of the public through prevention of price-fixing agreements, boycotts, combinations in restraint of trade, unlawful price discriminations, and other unfair methods of competition and unfair and deceptive acts and practices; to safeguard life and health of the consuming public by preventing the dissemination of false and fraudulent advertisements of food, drugs, cosmetics, and devices which may be injurious to health; and to make available to the President, the Congress, and the public factual data concerning economic and business conditions as a basis for remedial legislation where needed, and for the guidance and protection of the public interest.

Since the outbreak of war the staff was concerned also with special war work. It made thousands of reports, furnished numerous industrial studies, carried on priorities and related investigations in key and basic industries, examined and checked periodical, radio, and other advertising. Chairman in 1945: Edwin L. Davis.

FEDERAL WORKS AGENCY (FWA). An Agency of the U.S. Government comprising the five agencies which are concerned with the provision and financing of public works and services, namely, Public Works Administration, Public Buildings Administration, Public Roads Administration (qq.v.), Federal Fire Council, and Federal Real Estate Board. The functions of the Public Works Administration and the Work Projects Administration are now in process of liquidation in the Office of the Federal Works Administrator. Administrator in 1945: Maj. Gen. Philip B. Fleming.

FENCING. Two former champions regained titles in the national tournament that highlighted fencing last season. Lieut. Norman C. Armitage, U.S.N.R., who represents the New York Fencers Club, defeated Dr. Tibor Nyilas of Salle Santelli, his conqueror in 1944, and annexed saber honors for the tenth time while Dornell Every of the New York A.C., king in 1938 and 1940, wrested the foils title from Alfred Snyder, one-armed swordsman of the Fencers Club. Mack Gilman of Illinois gained U.S. épée honors and Miss Maria Cerra of the Fencers Club took the women's individual crown.

Brooklyn College dethroned Hunter as women's intercollegiate team champion, with Miss Julia Kassell, captain of the winning group, carrying off individual laurels.

THOMAS V. HANEY.

FERRO-ALLOYS. Dependence of the United States upon imports for many of the ferro-alloys used in making quality steels was further emphasized by the war. Although strenuous attempts were made to develop domestic mines, particularly for chrome and manganese, opening of the sea lanes was a signal for return to foreign sources.

Chrome. Scores of small mines which had sprung up in the Pacific Coast states early in the war

virtually ceased production in 1945, and national ore production was only 11,000 short tons. Most of the domestic ore had proved to be of lower grade than needed by the steel industry, and blending with high grade imported ores was necessary. Ore imports were 806,000 short tons, with shipments from Rhodesia, Russia, Transvaal, and Turkey. Resumption of shipments was expected from the Philippine Islands, which in prewar years supplied as much as one-quarter of United States requirements. As of Oct. 31, the Reconstruction Finance Corporation had accumulated a stockpile of refractory grade chromite of 236,855 gross tons for the government.

During the war chrome alloys were of vital importance. Stainless steel, which has a chrome content of about 18 per cent, had many uses in the aviation and transportation industries, and special alloys to withstand high temperatures were essential to the development of jet propulsion aircraft and rockets. Chrome chemicals proved to be critical, and plans were being laid to provide additional production facilities when the war ended. Chrome chemicals are used in the production of pigments for camouflage; priming pigments for aircraft, naval and maritime vessels; tanning of leather; textile processing; plating and anodizing; the manufacture of pure metallic chromium for special alloys; and other war uses. Their use in civilian paints will again assume importance during peacetime.

Manganese. Of the scores of American mines and gopher holes scratching for high grade manganese in the early part of the war, only Anaconda Copper Company and Domestic Manganese & Development Company in Montana and Dominion Manganese Corporation in Virginia were producing a substantial tonnage at the end of 1945. Montana accounted for more than three quarters of domestic production. Even the Sunshine Mine on the Olympic Peninsula in Washington, which became a substantial wartime producer, closed down in mid-year. Some production also came from Arizona, Arkansas, California, Nevada, and New Mexico. Together, the domestic mines produced 193,000 short tons of ore (35 per cent or more manganese content) in 1945 compared to a revised production figure of 247,616 short tons in 1944, according to the U.S. Bureau of Mines. Imports totalled 1,500,000 short tons of ore of that grade (1,157,561 short tons in 1944; 1,429,599 short tons in 1943). Union of South Africa, Gold Coast, Cuba, and Brazil were principal suppliers with lesser amounts from Chile, India, Russia and Mexico.

More than 90 per cent of manganese consumed in the United States, either as an ore or as an alloy, found its way to the steel industry, where its properties as a deoxidizer make it valuable in all steel production, and where it is also used to impart the quality of hardness to steel. Small amounts were used in the manufacture of dry cells, chemicals, and miscellaneous products. Ferro-manganese, spiegel-eisen, and silico-manganese are the principal alloy forms in which the element is introduced in steel making. The dry battery industry employs a particularly pure grade of manganese dioxide. Reconstruction Finance Corp., stockpiling for the government, had stocks of 939,543 gross tons of metallurgical grade manganese as of Oct. 31, 1945.

Molybdenum. Of the important ferro-alloys, molybdenum is one of two in which the United States normally is the world's principal producer. Mine production dropped to 36,500,000 lb. contained in concentrates in 1945 from a revised total of 38,679,500 lb. in 1944; 61,667,000 lb. in 1943; and 56,942,000 lb. in 1942. The sharp drop in the

past two years, although partly due to shortage of manpower, was not serious from the standpoint of requirements, for heavy exports to America's allies necessary early in the war and substitution for tungsten in making alloy steel no longer were necessary. The 1944 and 1945 production reflects, rather, a high level of domestic demand for normal usage. The Colorado mine of Climax Molybdenum Company, high in the Rocky Mountains, produces the majority of domestic ore, with other substantial amounts coming as a by-product of the porphyry copper mines. The Pine Creek mine of U.S. Vanadium Corporation in southeastern California produced a considerable tonnage along with tungsten until its operations were restricted in the fall of 1945. Commercial reserves of molybdenum ore in the United States are estimated to be sufficient to last for 422 years at the 1935-39 rate of use. The government, through the Reconstruction Finance Corporation, held a stockpile of 4,746,202 lb. of molybdenum contained in concentrates as of Oct. 31.

Introduced into steel, molybdenum imparts toughness, structural stability, elevated temperature strength, depth hardening, and reduces susceptibility to temper brittleness. Usually used in conjunction with such other alloys as chrome, nickel, or manganese, molybdenum is alloyed in steels used in stressed machinery parts, dies, high speed cutting tools, corrosion resistant alloys, and steels for use at elevated temperatures.

Tungsten. By the end of 1945, the United States had progressed so far towards meeting current tungsten requirements that it was able progressively to curtail its import contracts, principally with Bolivia. This contrasts with the situation as recently as 1936, when China and Burma produced about 70 per cent of the world supply, and very little was mined domestically. Domestic production declined in 1945 to 5,807 short tons (in terms of 60 per cent tungsten trioxide concentrates) from a 1944 production of 10,259 short tons. The curtailment reflected principally a drop in domestic and export demand which had commenced the previous year, and which promised to fall further with the end of war needs.

Expiration of government purchase contracts and lower prices shook down mining activities to three principal producers. By far the largest was the Yellow Pine mine of Bradley Mining Company in central Idaho, where a bonanza discovery just before the war was responsible for relieving a critical shortage. The Nevada-Massachusetts Co. in central Nevada was a large producer. The Pine Creek mine of U. S. Vanadium Corporation (see MOLYBDENUM), at Bishop, Calif., halted mining operations in the fall for further development work, but continued to treat tailings. Concentrates produced by several properties were treated at a government-owned plant at Salt Lake City.

Despite the fine wartime records of domestic mines, known reserves of tungsten ore in the United States are limited. An estimate by Elmer W. Pehrson of the U. S. Bureau of Mines indicated commercial ore reserves would be sufficient to last only four years at the average 1935-39 rate of use. About 8,500 tons (in terms of 60 per cent tungsten trioxide concentrates) were imported in 1945. Bolivia, followed by Brazil, furnished the majority of the tonnage, with Argentina, Peru, Mexico, and New Zealand supplying lesser amounts. In 1946, it was generally expected that China would resume her place as a leading supplier, with production also being resumed in Burma. Rich deposits, with some of the ore being picked from stream beds,

coupled with low-cost labor, indicated the revival of Chinese production.

Much of the domestic and most of the foreign ore was sold to the American Government which had accumulated a stockpile of concentrates, as of Nov. 30, having a tungsten content of 25,785,200 lb. Legislation was pending at the end of the year to create a permanent stockpile for use in future national emergencies. In addition stocks of close to 5,500,000 lb. in terms of tungsten content were held by industry.

Consumption, which dropped about 50 per cent following the peace with Japan, totalled about 14,800 short tons (in terms of 60 per cent tungsten trioxide concentrates). Military requirements for armor piercing shot went up early in the year in connection with the increased ammunition program following the Belgian break-through. Use of the metal in high speed tool steels was restricted April 7, 1945, after having been freed in August, 1944. With the end of the European war, restrictions again were lifted, effective July 4, and on July 24 allocation control was removed from all tungsten products except wire. In peacetime, the major use of tungsten is in alloy tool and die steels and tungsten carbide tools for the metal working industry, and for lamp filaments. Some also is used for gasoline motor valves, permanent magnets, chisels, and punches. The high-speed tool steel most widely used in the United States contains 18 per cent tungsten, 4 per cent chromium, and 1 per cent vanadium.

Vanadium. Domestic vanadium mine production in 1945 dropped rapidly following the end of the war with a total output of 2,950,000 lb. of contained vanadium in ores and concentrates. Increased emphasis was placed on vanadium production during the war, it was revealed, because of the occurrence of uranium in the vanadium ores of western Colorado, eastern Utah, and northeastern Arizona. From 2 to 4 per cent U_3O_8 (uranium oxide) is contained in these ores and its recovery was emphasized to supplement foreign uranium ores for use in the atomic bomb project.

Domestic vanadium ores were supplemented for normal uses by imports of 1,552,309 lb contained in ores and concentrates, principally from Peru. On Oct. 31, the United States Government, through the Reconstruction Finance Corporation, maintained a stockpile of ores and concentrates containing 1,805,568 lb. of vanadium. Legislation was under consideration to retain this and other metals in a permanent stockpile to be held against future emergencies. Unmined commercial vanadium ore reserves of the United States were estimated by the U.S. Bureau of Mines to be sufficient for only 7 years' consumption at the average 1935-39 rate of use, although future development may uncover additional deposits.

Consumption was slightly higher than in 1944, when 5,355,241 lb. were used. It also slightly exceeded the total of domestic production plus imports, the balance coming from stockpile. Like tungsten, vanadium is an important alloying element in the production of high-speed steel used for cutting metals. Vanadium steels also are used in forging and casting highly stressed mechanical parts, having particular importance in the automotive industry. Improved supplies of vanadium permitted the removal of restrictions on its distribution by the War Production Board June 6.

CHARLES T. POST.

FILIPINO REHABILITATION COMMISSION. A Commission created by Act of Congress, approved June

29, 1944, to investigate and formulate recommendations on all matters affecting postwar economy, trade, finance, economic stability, and rehabilitation of the Philippine Islands, including the matter of damages to public and private property and to persons occasioned by enemy attack and occupation. U.S. Chairman, Millard E. Tydings.

FINANCIAL REVIEW. The dominant financial development of the war period, a rapid inflation of the nation's money supply resulting from the purchase of huge amounts of Government securities by the banks, showed little sign of abatement. Although the war came to an end, the supply of Treasury obligations expanded. The Victory Loan drive in December, like the earlier war loan drives, stimulated considerable purchases of Government securities by the banks, creating billions of additional deposits.

Since goods and services were not available in sufficient volume, an abnormally large part of the

national income of the year was perforce saved. Net savings of individuals in 1945 were estimated at \$35,000,000,000, as compared with \$39,900,000,000 in 1944. These huge savings, chiefly in the form of cash, played a major part in the rise in stock and real estate prices during the year, and greatly complicated the task of the Office of Price Administration in its effort to stabilize the commodity price structure.

The Stock Market. Stock prices advanced throughout 1945, the only sizable reaction occurring in midsummer when the Japanese collapse appeared imminent. The German surrender, it was recognized, would not produce drastic economic changes because of the determination of the armed forces to continue all-out warfare in the Far East to precipitate an early Japanese collapse. But when one military setback after another brought nearer the surrender of Japan, it was feared that a drastic decline in industrial production lasting several months would cut corporate earnings sharply. The

Dow-Jones Industrial Average

INDUSTRIAL AVERAGE, 1932-45

sporadic liquidation produced by this fear proved short-lived, however. A vigorous advance in stock prices got under way in August which carried the averages above the 1937 peak and up to the highest point reached in 15 years. The advance was accompanied by a moderate expansion of turnover, but the 75 percent margin requirement prevailing prevented any material increase in security loans such as accompanied strong markets in the past.

The advance in share prices was broad and inclusive. Stocks of companies in industries that would benefit greatly with the end of the war, such as retailing, automobile manufacture, railroad equipment manufacture and building, were prominent in the rise. But sharpest gains were registered in low-priced stocks in many fields, particularly some of the junior public utility holding company issues where recapitalization plans were modified to recognize higher portfolio values, to the advantage chiefly of the junior equities. The repeal of the excess profits tax was a powerful influence during the final months of the year, with sharp advances in liquor, public utility operating company and other groups likely to enjoy a sharp rise in earnings in 1946 because these corporations had been paying large excess profits taxes.

Major influences behind the year's bull market were:

1. Confidence that a protracted period of record production of civilian goods would follow reconversion, because of severe shortages produced by the war and ample purchasing power possessed by the population.

2. Repeal of the excess profits tax and expected further reductions in other taxation, which would increase corporate net income.

3. Constant increase in the volume of liquid funds available for investment, and the declining level of interest rates which makes investors content with lower stock, as well as bond, yields.

4. Growing pressure upon commodity price ceilings, indicating that the price level might rise sharply following the lifting of controls. Rising commodity prices, by expanding profits of business, usually benefit stockholders.

5. Significant changes in Administration personnel and domestic policies following the death of President Roosevelt, indicating a swing to the right. This last factor played a considerable part in the increased popularity of utility securities.

Not only expected reconversion difficulties, but especially the serious labor troubles that developed in the final months of the year, were largely ignored by the security markets. To an extent seldom encountered in the past, investors were concerned with the longer-term outlook, and ignored near-term developments. Although the bull market which began in the spring of 1942 had lasted almost four years without significant interruption, buying orders continued to pour into brokerage houses until the close of 1945.

The turnover on the New York Stock Exchange aggregated 377,563,575 shares during 1945, as compared with 263,074,018 shares in 1944. This was the highest turnover on the Exchange since 1937. The largest daily turnover of the year was 2,938,050 shares on June 28. Showing the great change in the character of the market produced by margin regulations and other controls, this maximum turnover for the year compared with the record for all time of 16,410,030 shares reached on Oct. 29, 1929. The *New York Times* index of 25 industrial stocks showed a rise of 24 per cent for the year, and the index of 25 railroad stocks gained 34 percent.

Dividend payments were moderately larger, as

the end of the war reduced pressure to build up cash balances of corporations and led to a number of extra dividends, stock dividends and split-ups. Cash dividends for major groups of corporations in 1945 compared with 1944 as follows:

TABLE 1—DIVIDEND PAYMENTS

Bond Market. Pressure of idle funds of financial institutions, corporations and individuals seeking investment strengthened bond prices and depressed interest rates to a record low level. The most significant development in the Government bond market was the special strength of Treasury obligations eligible for bank investment. Becoming convinced that low interest rates would continue for an indefinite period because of the Government's effective control over the money market, banks reached out for longer-term issues in order to increase their earnings. Since many of the outstanding longer-term issues are not eligible for bank investment for a number of years, a growing discrepancy developed between yields of bank eligible and non-bank eligible Treasury issues. Thus, the Treasury 2½s of 1972 which were not eligible for bank investment closed the year at 101½ $\frac{32}{32}$, whereas the 2½ percent issue maturing in the same year that is eligible for bank investment closed at 108 $\frac{24}{32}$.

The average yield of United States Government obligations maturing in 15 years or longer was 2.3 per cent at the end of the year, as compared with 2.48 per cent at the end of 1944. The average yield of partially tax-exempt issues with similar maturities was 1.5 per cent, as compared with 1.87 per cent at the end of 1944. Late in the year, the market for all Government securities strengthened because of the belief that the Victory Loan drive provided the last opportunity for a long time to come to acquire such obligations by direct subscription at par.

Since new corporate bond issues for the year were chiefly for refunding, the supply of corporate bonds remained limited and their quotations strengthened in sympathy with those of Federal obligations. Yields on bonds of various ratings for December, 1945 compared as follows with those of the same month of the previous year:

Rating	1944	1945
Aaa	2.70	2.61
Aa	2.76	2.68
A	2.98	2.79
Baa	3.49	3.10

Bond dealings on the New York Stock Exchange aggregated \$2,261,000,000, the smallest since 1941. The decline in turnover reflected the dwindling proportion of speculative issues, in which turnover is usually greatest. The turnover in bonds in 1944 aggregated \$2,694,000,000. The yield of 15 high-grade municipal bonds averaged 1.64 in December, as compared with 1.87 per cent in December, 1944. Average yields on a group of industrial obligations declined from 2.74 in December, 1944 to 2.64 in

Dow-Jones Average of 40 Bonds

THIRTEEN-YEAR MOVEMENT OF 40 STANDARD BONDS

the final month of 1945; on 40 railroad bonds from 3.25 per cent to 2.96, and on 40 public utility obligations from 2.96 per cent to 2.79.

New Financing. The Federal Government accounted for the bulk of the year's new security issues. The public debt increased by \$46,803,000,000 during 1945, of which \$7,822,000,000 was obtained through net sales of non-marketable war savings bonds, and \$28,838,000,000 through issues of marketable bonds. Another \$7,754,000,000 was obtained through net sales of certificates of

purchases of Government securities, \$18,000,000,000 was withdrawn in the form of currency, and the other \$50,000,000,000 represented additions to deposits of individuals and corporations.

The increase in corporate liquid resources placed American corporations in the strongest financial position ever attained. At the close of 1945, all corporations held almost \$30,000,000,000 of Government securities and more than \$20,000,000,000 of cash. These totals were apart from large sums held by unincorporated businesses. The Securities and

indebtedness maturing within one year, and \$609,000,000 through the sale of additional Treasury bills. A total of \$3,674,000,000 was obtained from the sale of special issues of Treasury obligations, chiefly to the social security funds.

State and municipal financing continued at low ebb, pending the time when large scale public works could again be inaugurated by these government bodies. Such offerings aggregated \$795,000,000, which compared with \$639,000,000 in 1944. Public offerings of obligations of Federal credit agencies aggregated \$938,000,000, as compared with \$433,000,000 in 1944. Corporate financing increased materially, both for new capital and for refunding. Refunding was encouraged not only by the decline in interest rates, but also by the fact that premiums on called bonds and expenses could be charged against the excess profits tax. Therefore, many bond issues were refunded even though only small reductions in interest payments would result for the issuer.

New financing for 1945, except for direct Treasury obligations, aggregated \$7,917,000,000, which compared with \$4,153,000,000 in 1944. This was the highest level reached since 1929.

The Nation's Savings. Net savings of individuals during 1945 were estimated by the Department of Commerce at \$35,000,000,000, as compared with \$39,900,000,000 in 1944. The distribution of these savings, and their aggregate volume are shown in Table 3.

Explaining the impact of war financing upon the nation's monetary system, Undersecretary of the Treasury Daniel W. Bell pointed out that the Government spent \$323,000,000,000 between July 1, 1940 and June 30, 1945, approximately the period in which World War II dominated United States Treasury financing. Of this vast sum, which amounted to almost 40 percent of all spending that took place throughout the country in these five years, only \$133,000,000,000 was raised through taxation. This left a deficit of \$190,000,000,000, of which \$122,000,000,000 was obtained through sales of Federal securities to non-bank investors, while banks absorbed \$68,000,000,000. Of the \$68,000,000,000 of deposits thus created through bank

Exchange Commission reported current assets and liabilities of all United States corporations except banks and insurance companies as follows:

Regulatory Developments. The persistent advance in stock prices was recognized as resulting, at least in part, from the expansion of the money supply, and thus as reflecting to a degree inflationary forces present in the economy. However, some measures were taken or proposed by regulatory authorities to check expansion of trading and rising prices.

The Board of Governors of the Federal Reserve System raised margin requirements from 40 to 50 per cent in February, and from 50 to 75 percent in July. On March 5, 1945, the New York Stock Exchange sought to discourage shoestring speculation in low-priced shares by raising from \$5 to \$10 the minimum price of stocks that could be carried in margin accounts, and established an initial margin requirement of 10 points on stocks selling over \$10 a share. At the same time, a minimum equity of \$1,000 was required for margin accounts. No such minimum had been set previously.

The most drastic proposal to check security

market speculation was that advanced in March by Chairman Marriner S. Eccles of the Board of Governors of the Federal Reserve System. Mr. Eccles urged that, beginning Jan. 1, 1945, a special tax of 90 percent be imposed on capital gains derived from the sale of assets held less than two years. This would apply only to securities and real estate acquired after Jan. 1, 1945, so as not to discourage liquidation of those bought previously. The special tax rate would decline by 10 percent or more each year after 1945, until it would return to the rate prevailing before the law was passed. In advocating this plan, Mr. Eccles referred to the prevailing 25 percent long-term capital gains tax as "the most serious gap in the line of defense against inflationary forces." However, little support developed for this plan within Congress, and with the end of the war the national legislature was much more interested in tax reduction than in the imposition of new taxes.

JULIUS I. BOGEN.

FINE ARTS, Commission of. The official advisory body of the U.S. Government upon matters of art, composed of seven members appointed by the President. Chairman: Gilmore D. Clark. It is not to be confused with the Section of Fine Arts of the Public Buildings Administration, which was formerly charged with the selection and placing of designs in public buildings but was discontinued in 1943.

FINLAND. A republic of Northern Europe. Capital, Helsinki (Helsingfors).

Area and Population. Finland's original area of 149,588 sq. mi., including about 11 percent of inland water area, was reduced to 134,253 sq. mi. by the Soviet-Finnish peace treaty of Mar. 12, 1940, and was further reduced to about 127,600 sq. mi. under the terms of the armistice of Sept. 19, 1944, following the second war with Soviet Russia. The estimated population of the prewar area on Jan. 1, 1943, was 3,887,217. About 89 percent of the inhabitants speak Finnish and most of the remainder Swedish. Estimated populations of the chief cities on Jan. 1, 1940, were: Helsinki (Helsingfors), 304,965; Tampere (Tammerfors), 76,730; Turku (Åbo), 74,351; Viipuri (Viborg)—ceded to the Soviet Union—74,247; Vaasa (Vasa), 32,695. Swedish place names are given above in parentheses.

Government. The Constitution of July 17, 1919, vested executive powers in a President elected for six years by 300 electors, chosen in the same manner as members of the Diet. Legislative power rests with the unicameral Diet and the President. The 200 members of the Diet are elected by direct vote of all citizens, male and female, 24 years or more of age. The standing of the parties in the Diet elected July, 1939, was: Social-Democrats, 85; Agrarians, 57; Coalition Party, 25; Swedish People's Party, 18; IKL (Fascist group) 8; Progressives, 7. For the present composition of the Diet, see **EVENTS**, below. President of the republic is Field Marshal Baron Carl Gustav Mannerheim, who was elected to this post on Aug. 1, 1944, upon the resignation of President Risto Ryti. Under the emergency legislation passed at that time (see **YEAR BOOK** for 1944, p. 217) some functions until then exercised by the President were transferred to the Premier. Juho K. Paasikivi became Premier on Nov. 17, 1944.

Education and Religion. School attendance in 1938-39 was: elementary, 403,403; secondary, 50,580; university and schools for higher education, 8,752; vocational and technical, 20,583. Less than

1 per cent of the adult population was illiterate in 1930. War damage to educational institutions in 1939-40 was estimated at 333,000,000 marks. The Technical University of Helsinki, where damage totaled 20,000,000 marks, was repaired and reopened by Oct. 1, 1940. The population on Jan. 1, 1938, included 3,680,237 Lutherans, 70,887 Greek Catholics, 9,840 Baptists and other Evangelical church members, 1,551 Roman Catholics, 1,755 Jews, and 360 Moslems.

Production. In 1930 60 per cent of the working population was engaged in agriculture and 16.8 per cent in industry, but Finland produced only about four-fifths of its agricultural requirements in the period before 1939. The two wars with Russia in 1939-40 and 1941-44 placed a great strain upon the Finnish economic system. The 1942 grain harvest of 425,000 metric tons was about 70 per cent of normal. The yield of sugar beets was 132,000,000 lb., or 50 per cent more than in 1941; of potatoes, 2,136,200,000 lb. (1,744,600,000 in 1941). The livestock census of March, 1942, showed 273,838 horses, 1,487,663 cattle, 352,016 sheep, 236,566 swine. The output of sawn timber in 1943 was 500,000 standards (of 1,980 bd. ft.), compared with 450,000 standards in 1941 and a normal production of about 1,200,000 standards. The 1941 production of plywood was 1,059,399 cubic ft.; chemical wood pulp, 590,000 tons; mechanical wood pulp, 20,000 tons; newsprint, about 50,000 tons; other paper, about 190,000 tons. Manufacturing is mainly in agricultural or forest products.

Foreign Trade. In 1944 imports were valued at 8,919,600,000 Finnish marks (12,876,000,000 in 1943); exports, 6,580,000,000 Finnish marks (8,712,000,000 in 1943). In 1945 imports totaled 6,820,000,000 Finnish marks; exports, 11,471,000,000 Finnish marks, including 4,171,000,000 marks for war reparations.

Events, 1945. Finland's war with Germany continued through the early months of 1945. Retreating slowly toward North Norway, the Nazis' Lapland Army hung on stubbornly to their winter positions in the northwestern corner of Finland.

On March 3, the Helsinki Government released a declaration, dated March 1, that formalized the existing state of war between Finland and Germany since the first clashes on Sept. 15, 1944. On April 26 a communiqué announced that the Germans had been "practically driven out of Finland," but some fighting continued right up to the formal surrender of Germany on May 8.

General Elections. Finland's first parliamentary election in six years,—and the first election to be held in any European country freed from the Nazis—took place, as scheduled, on March 17. Of the two million eligible voters, 1,497,533 went to the polls in the highest vote ever recorded in that country. By all accounts the election was completely free and honest and no attempt was made either by Russia or by the Allied Control Commission to influence the vote.

The results of the election were much as expected. The Social-Democrats, whose leaders, Väinö Tanner in particular, had actively supported Finland's disastrous war policy, lost heavily, retaining only 52 of their 85 seats in the last Diet. Virtually all the dissident Social-Democratic vote, and a great deal more, went to the newly organized coalition known as the Popular Democrats, in which the Communists are predominant. This group, at its first electoral test, obtained 358,988 votes, as compared with 368,201 for the Social-Democrats, and gained 51 seats in Parliament.

On the right, the Agrarian League came out

strongest with 244,384 votes and 46 seats, a loss of eleven; the conservative Coalition Party gained three seats, for a total of 28, and polled 121,733 votes. In the center, the Swedish People's Party obtained 132,530 votes and 16 seats, two less than before. The Progressives, with 58,858 votes and seven seats, maintained their position. The IKL, or Finnish Nazi Party, was barred from the poll, but various other small groups also participated.

Thus, the Left (Social-Democrats and Popular Democrats) won a slight majority of seats—103 out of a total of 200—in the Diet, but the old animosity between the two groups persisted, ruling out any possibility of a coalition between them.

Instead, Premier Juho K. Paasikivi, who resigned on April 9 but was immediately asked by the President to form a new government, again brought all major parties together in a revised coalition Cabinet, reflecting the changed composition of the Diet. Accordingly, ten out of the 18 new Cabinet ministers were selected from the Left, and eight from the Right and Center; of the five Popular Democrats included, three were outright Communists and two were dissident Socialists. The swing to the left was more clearly indicated in a general reshuffle of Cabinet posts which left the Communist leader Yrjö Leino in charge of the Ministry of Interior (and thereby of the police) while another Popular Democrat of note, Johan Helo, took over the department of education. Carl Johan Enckell, a Swedo-Finn, remained at his post as Minister of Foreign Affairs.

In presenting his new Cabinet, which took office on April 17, Premier Paasikivi declared that it would follow the same foreign policy as its predecessor, "based on Finland's freedom and independence." At home, he promised, the Government would do everything in its power to sweep away the remains of German and Fascist influence.

A Military Plot and Purge. Before long, the radical and energetic new Minister of Interior Leino was able to demonstrate his determination to do away with the sins of the past. Early in May, discovery of a secret arms cache in the Uleaborg district led to an extensive hunt for hidden weapons in the course of which well-stocked arms and ammunition depots were unearthed all over the country. The investigation brought to light that high-ranking officers of the General Staff had minutely organized this concealment of arms in flagrant violation of the armistice. As a result of these disclosures, the Chief of the General Staff, General Airo, two colonels, Nihtilä and Haahti, and a number of lesser officers were arrested in mid-July. General Axel E. Heinrichs, commander-in-chief of the Army was forced to yield his post to Lt. General J. Lindquist. The sensational affair continued to reverberate throughout the summer and on Sept. 22 Mr. Leino announced that in all 200 persons had been arrested in connection with it. By that time, the plot, which apparently had aimed at an armed uprising against the Paasikivi regime, had been fully smashed.

Relations with Russia. The timely discovery and vigorous suppression of the military plot helped greatly to dissipate Russian suspicions which had been accumulating in the earlier part of the year. Moscow was dissatisfied with the way Finland fulfilled a number of armistice conditions, in particular those relating to the disbanding of "anti-Soviet" organizations and the trial of alleged war criminals. In both respects, Finland proved to be slow rather than uncooperative. The purge of the General Staff, preceded by abolition of the traditionally anti-Russian Civic Guards' Corps, and followed by

the indictment of pro-German leaders (see below), cleared the atmosphere and by the end of the year few issues remained between Finland and Russia.

In the matter of reparations, Finland bent all its energy to fulfill the armistice obligations fully and on time. However, at the close of the first year, ending Sept. 18, there was a slight deficit in the stipulated quota of \$50,000,000 worth of deliveries. This was due to difficulties in obtaining enough raw materials and machinery for the production of the stipulated amount of metal goods; included in the deliveries were 300,000 tons of merchant shipping valued at \$14,000,000.

These reparations payments accounted for about 85 percent of all Finnish exports during that period, leaving only a slim margin of foreign exchanges for which compensation was received. As a result, Finland's economic situation showed little improvement during the year. There was, as in other European countries, an acute shortage of coal that hampered industrial recovery. No early relief was in sight for the general scarcity of consumer goods and the supply of food remained, throughout the year, just above starvation levels. Russia supplied some cereals and a little coal and Sweden provided assistance by granting Finland a \$50,000,000 credit.

The outlook for 1946 was gloomy. Although Russia, as a result of negotiations conducted in October in Moscow by Minister Helo, agreed to spread its total reparations claim of \$300,000,000 over eight years instead of six, the amount payable in 1946 was increased by an additional demand for \$14,000,000 to make up for the damage caused in East Karelia by the Finnish army during the war. Inasmuch as payments effected in 1945 had strained Finnish resources to the limit, it appeared doubtful whether Finland could meet the next year's quota without credits from abroad.

These difficulties notwithstanding, Finland's relationship with Russia on the whole developed satisfactorily. There were practically no incidents between the few Russian soldiers stationed in the country and the population. Premier Paasikivi in an address on the first anniversary of the armistice, on Sept. 19, praised the moderation and understanding shown the Finns by the Soviet Chairman of the Allied Control Commission, Gen. Andrei A. Zhdanoff.

Diplomatic Rehabilitation. At the Potsdam Conference of the Big Three in July agreement was reached on an early resumption of diplomatic relations with Finland. Moscow moved first, appointing a minister to Helsinki on Aug. 6. The United States and Great Britain followed suit two weeks later. Simultaneously the Allied Control Commission in Helsinki lifted a number of restrictions on Finnish shipping and aviation.

The question of a peace treaty between the Allies and Finland was taken up at the Foreign Ministers' meeting in September, in London, but was left hanging fire when the conference broke up without practical agreements. On Nov. 5 the State Department removed all Finnish citizens and firms from its economic blacklist, thus clearing the way for the restoration of normal trade relations between the two countries.

Presidential Crisis. In the latter part of the year, two closely connected issues kept Finland astir: the war guilt question and President Mannerheim's retirement.

The position of the aging President had been awkward from the moment the armistice was signed. There never was any question but that Mannerheim, as commander-in-chief of the Fin-

nish Army, bore a large share of responsibility for Finland's involvement at the side of Germany. The Soviet press had frequently and viciously attacked him as a leading war criminal. The Finnish Communists were not less outspoken in their criticism of the President.

The events of 1945 increasingly weakened Mannerheim's already shaky position. He had hinted that he would resign after the elections of March 17, but failed to do so, although the swing to the left placed some of his personal enemies into positions of great power. The scandal of the secret arms caches, involving many of the President's friends and close associates, further sapped his prestige. When the war guilt issue, after many postponements, finally came up for action, Mannerheim's position became untenable.

Under the terms of the armistice, Finland had bound herself to prosecute not only "war criminals," i.e. persons guilty of crimes committed in connection with the war, but also the so-called "war responsables," a term applied to former government leaders such as President Risto Ryti, Premier Jukho W. Rangell, and Finance Minister Väinö A. Tanner.

Aside from the Communists and other radicals, few people in Finland were eager to comply with this provision of the armistice. The general tendency, shared by Paasikivi, was to let bygones be bygones if it could be done without arousing Russia. The Soviets, far from condoning the past, kept prodding the Finns and eventually gave clearly to understand that they would take matters into their own hands if the Finnish Government failed to prosecute the war responsables.

In May the Diet set up a special investigating body, the so-called "Hornborg Committee," (so named after its chairman, Eric Hornborg, a Swedo-Finnish scholar and lawyer) which rendered a lengthy report on July 28. The report charged that some of the former leaders had "passively and probably consciously" allowed Finland to drift into the war, but it refrained from making personal charges.

Nobody was satisfied with the Hornborg Report, least of all Moscow and General Zhdanoff. After a formal protest delivered by the latter, Paasikivi reversed his stand on the war guilt issue and adopted the view that the national interest demanded speed and vigor in the prosecution of war criminals. On Aug. 15 he introduced in the Diet a bill authorizing the formation of special courts to try war criminals and political leaders responsible for the war. The bill encountered heavy opposition but was finally passed early in September. About the same time it was learned in Helsinki that President Mannerheim was seriously ill and had been hospitalized.

Mannerheim's illness (a catarrhal infection) was real, but its gravity was more of a diplomatic nature. On Oct. 19 the President turned over his functions to Paasikivi on the ground that he was unable to exercise them because of illness. Political circles in Helsinki, however, admitted freely that Mannerheim really had stepped down so as not to identify himself with the forthcoming trials of war responsables, several of whom were among his personal friends. On Nov. 4 Mannerheim left Finland by ship for Madeira for a prolonged rest cure. There was little doubt that his departure had a political background and it seemed unlikely that he would ever resume his functions. In the meantime, Premier Paasikivi also took over the office of President.

War Trials Start. The long-delayed trial of the

principal "war responsables" finally began on Nov. 15 in Helsinki. Eight persons were named as defendants. They included, in addition to the aforementioned Ryti, Rangell, and Tanner, former Premier Edwin Linkomies, former Foreign Minister Karl Henrik Ramsay, former Interior Minister Antti Kukkonen, former Finance Minister Tyko Reinikka, and the former Finnish Minister to Berlin, Toivo Kivimäki; all were arrested on Nov. 8.

Highlights of the indictment, presented by Prosecutor Toivo Tarianne, were the charges that the defendants, during the armistice period of 1940-41, had maintained Finland in a virtual state of war, and that President Ryti, in June, 1941, had concluded a military pact with Germany. The prosecution also involved Mannerheim in its charges. In the absence of the President, a deposition of his was read into the court records in which Mannerheim described the Ryti-Ribbentrop agreement of June, 1944, (see 1945 Year Book) as "a patriotic action," and declared, "I always defended, and will always defend the Ryti-Ribbentrop agreement." On Nov. 17 the trial was adjourned until Dec. 10 to give the defendants time to prepare their defense.

JOACHIM JOESTEN.

FIRE PROTECTION. During the early months of 1945, fire in a form more devastating than ever before witnessed in world history was visited upon the cities of Germany and Japan. The terrific toll of death and destruction caused by the aerial incendiary attacks on the metropolitan centers of our enemies can be appreciated only by those who have actually seen the results. The so-called "firestorms" reported in various German cities exceeded in intensity and devastating effect any recorded conflagration of peacetime, and rendered fire fighting efforts completely futile. "Firestorm" is a mass of fresh air moving at hurricane rate to replace superheated rising air. "Firestorms" were of sufficient power to uproot trees of all sizes and blow down doors and windows.

Meanwhile, here in the United States the trend of ever rising fire losses continued apace. According to the National Board of Fire Underwriters, the national fire loss was estimated at \$455,329,000, the largest annual loss since 1930. This estimate is conservative as it does not include a number of large losses in government-owned properties which are not reported in the usual manner. For purposes of comparison the annual fire losses for the past ten years follow:

1936.....	\$266,659,449	1941.....	\$303,895,000
1937.....	254,950,423	1942.....	314,295,000
1938.....	258,477,944	1943.....	373,000,000
1939.....	275,102,119	1944.....	423,458,000
1940.....	285,878,607	1945.....	455,329,000

No less than 150 fires, each of which resulted in a loss of a quarter million dollars or more, occurred in the United States, Canada, and Alaska. Seventeen of these were in Canada and two in Alaska. The number of these large loss fires represents an increase of 33 per cent over the number reported to the National Fire Protection Association for 1944 and an increase of 240 per cent during the past five years.

The largest loss of the year occurred on Sept. 15 when fire, following collapse of three U.S. Navy blimp hangars during a hurricane which struck the Richmond (Fla.) Naval Air Station, destroyed 366 Navy planes, 25 Navy patrol blimps, and 150 automobiles. The loss from this fire has been variously estimated at more than \$30,000,000. This

fire is of particular interest also because of the extensive use of flameproofed timber in the hangar construction. Nearly 80 per cent of the 9,000,000 square feet of timber used in the construction of these hangars had been treated by a pressure impregnation process to meet Navy specifications. This flameproofed timber gave a good account of itself, resisting ignition except in areas where large quantities of gasoline or other flammable liquids were present.

Probably no fire of the year attracted so much nationwide publicity, as that which followed the collision of an Army bombing plane with the Empire State Building in New York on the foggy morning of July 28. The plane tore a huge hole in the north wall of the skyscraper at the 78th and 79th floors, and burning gasoline spread over the area, a considerable part of which was either vacant or used for storage purposes. Fourteen persons were killed and twenty-five injured in this disaster.

The largest individual losses of life were accounted for by a dust explosion in a grain elevator at Port Arthur, Ontario, on Aug. 7 and an explosion followed by several fires in a coal mine at Pineville, Kentucky, on Dec. 26. The toll in the first instance was 22 dead and 27 injured. The coal mine disaster took 24 lives. On Jan. 31, fire in a small foster home for infants and young children at Auburn, Maine, took the lives of 16 children and a nurse. On Christmas eve, a Christmas tree fire in a hospital for old people at Hartford, Connecticut, cost 16 lives.

During the first eight months of 1945 the wartime problems of fire protection continued. With the coming of peace a new set of problems confronted the fire protection profession. The reconversion of industrial plants to the production of peace time commodities presented great possibilities for serious fires unless extreme care was taken to maintain protective facilities and services during the conversion period. At the year's end the fear of serious fires in plants under conversion had not been realized.

With the ending of the war, the problem of fire protection of the tremendous quantity of surplus property became more acute, and during the closing months of 1945 steps were taken by the Reconstruction Finance Corporation to adopt measures of protection.

The acute shortage of housing facilities and the pressing need for new housing presents a very real danger in the possibility of a breakdown in existing building regulation which would permit the erection of definitely hazardous structures. Many cities are reviving interest in building codes and there is considerable activity in the revision of existing codes. People are demanding shelter, however, and even the elementary rules of fire-safe construction may be broken unless careful and intelligent guidance is given in each community.

As the result of selective service, the highly paid jobs in war industries, and the wartime scarcity of fire apparatus, municipal fire departments have been left in a weakened condition. Thousands of servicemen, particularly in the Navy have received excellent training in fire fighting techniques. Many of these men will undoubtedly become available to municipal fire departments in the year ahead, but fire departments generally are faced with the responsibility for making the fire service attractive to these trained recruits.

1945 saw the end of the Office of Civilian Defense which since 1941 had been a factor in fire protection throughout the country. With it went

the States War Inspection Service, an OCD sponsored scheme for the fire inspection of important industrial plants, which for some two years had rendered valuable service.

A development of great interest to fire protection engineers was the adoption by the War Manpower Commission of an adequate and accurate definition of fire protection engineering. That there is such a separate and distinct profession has not been generally recognized, and this official definition should help materially.

In the field of fire prevention education, interest and activity continued to increase. Fire Prevention Week in October, 1945, was probably more widely observed throughout the United States and Canada than ever before. Winner in the contest sponsored by the National Fire Protection Association for excellence in the observance of Fire Prevention Week was Memphis, Tenn. Jersey City, N. J., and Chicago, Ill., placed second and third respectively.

In the Inter-Chamber Fire Waste Contest conducted by the National Fire Waste Council of the U. S. Chamber of Commerce for year-round fire prevention activities, Wichita, Kansas emerged as winner of the grand award for its performance in 1944.

CHARLES SUMNER MORGAN.

FISCAL SERVICE. A division of the U.S. Department of the Treasury which consists of the following: Office of the Fiscal Assistant Secretary (Edward F. Bartelt); Bureau of Accounts (Vacant); Bureau of the Public Debt (William S. Broughton, Commissioner); Office of the Treasurer of the United States (William A. Julian, Treasurer).

FISH AND WILDLIFE SERVICE. Although still on a wartime basis during most of 1945, the Fish and Wildlife Service devoted as much effort as possible, with limited personnel, to the business of providing the greater wildlife resources that will be required and demanded by the American nation for public enjoyment now that the war has ended. Hunting and fishing will greatly increase because great numbers of young men who under normal civilian life would not have had the opportunity have become thorough outdoorsmen. Thousands will want to hunt and fish who previously sought other recreation.

In an effort to re-establish one of America's favorite game fishes in the rivers of the northern Atlantic coast, the Service planted about 68,000 salmon in the rivers of Maine in the fall of 1945. Atlantic salmon were planted in the St. George River and the east branch of the Penobscot, and silver salmon in the Pemaquid and Ducktrap Rivers. All the salmon were reared from the egg stage at the Federal hatchery at Craig Brook, Maine.

The 108 Federal fish hatcheries, maintained in 42 states, produced a total of 5,740,067,958 eggs, fry, and fingerling, or larger fishes during 1944. Nearly 4 million fishes were supplied for the stocking of 5,446 farm fish ponds.

Under the terms of the Pittman-Robertson Act, \$880,000 was apportioned among the states for the restoration and development of their wildlife resources for the fiscal year beginning July 1, 1945. Since participating states are required to contribute 25 percent of the cost of the projects, a total of \$1,179,999.99 was made available for wildlife restoration projects. During the past fiscal year 168 projects, obligating \$1,040,040, were approved.

The nation-wide system of wildlife refuges con-

tinued to be a most important safeguard to the country's waterfowl populations and to provide haven during some part of the year for at least one-fourth of the migratory waterfowl in North America. In spite of war conditions, waterfowl marshes on the refuge area improved—with a secondary result that the production of fur animals has steadily increased. During the 1944-45 trapping season, 222,421 fur animals were taken on refuge areas, of which 214,432 were muskrats. Commercial fishermen removed 1,786,499 pounds of rough fishes from refuge waters. Recreational fishing totaled 141,257 man-days and resulted in the taking of 697,703 fishes. Revenue from economic use on national wildlife refuges, including the disposition of big game animals, fur animals, and surplus products, amounted to \$275,555 during the past year.

On the basis of its annual January inventory of the migratory waterfowl in the United States, the Service estimated the 1945 population at 105,500,000, a decrease of approximately 20,000,000 from the 1944 figure. The number of banded birds reported during the year was 142,569, of which 31,113 were migratory waterfowl. The grand total since the inception of the work under Government auspices is in excess of 5,600,000. Recovery records to the number of 14,759 were obtained during the year, bringing the total to 346,243.

The 65 U.S. game management agents, working singly or in cooperation with State officers, obtained 2,328 convictions, fines and costs of \$80,685.72, and jail sentences of 964 days. As of Sept. 28, 1,458,628 "duck stamps" were reported sold during the 1944-45 season. For the fiscal year ended June 30, 1944, 7,846,168 fishing licenses and 7,505,258 hunting licenses were sold by the various states.

The waterfowl control program in California proved highly successful in abating damages to agricultural crops. In other depredation areas game agents worked with farmers in frightening ducks from unharvested crops.

Notable progress was made in the Service's wildlife research laboratories at Denver, Colo., and Bowie, Md., in the search for new rodenticides through the development and field demonstration of the utility of a compound called "1080." This material, sodium fluoroacetate, poisons rodents as well as certain other mammals and birds. It is readily soluble in water, has only a slight taste in the dilutions in which it is commonly used, and is adaptable to most of the methods used in rodent bait preparation. Extensive controlled experiments as to the effects of DDT on fish and wildlife were begun at the Patuxent Research Refuge at Bowie, Md.

As a result of a relentless war against predatory animals in the West, tens of thousands of lambs, calves, and turkeys went to market this year instead of into the maws of hungry coyotes and bobcats. A total of 112,451 predators were taken in Federal-cooperative control operations in spite of wartime handicaps caused by a shortage of trained hunters, automotive equipment, and various ingredients of predator control baits. The total take consisted of 102,979 coyotes, 7,325 bobcats and lynx, 1,365 wolves, 619 stock-killing bears, and 163 mountain lions.

A total of 76,964 sealskins were taken during the summer sealing period on the Pribilof Islands of Alaska, a 61 per cent increase over the 47,652 taken last year. The 1945 census of these animals indicated that there were 3,155,268 animals in the herd, an increase of 209,605 over the 1944 total.

When the Federal Government took over direct management of the herd less than 35 years ago, fewer than 120,000 animals remained following decades of slaughtering.

The Office of the Coordinator of Fisheries, which was established for the handling of the wartime problems of the fishery industry, was discontinued at the end of 1945.

The Division of Commercial Fisheries has emphasized assistance to the fishery industry in its problems of production, processing, and marketing. Such aid will continue, looking to the development and maintenance of successful peacetime operations.

Two new offices for the dissemination of daily market information on supplies and shipments of fish and fishery products were opened in 1945, one at San Pedro, Calif., in August and the other at Hampton, Va., in December. The Jacksonville, Fla., office, closed since August, 1943, because of lack of operating funds, was re-opened.

IRA N. GABRIELSON.

FISHERY COORDINATION. Office of. An Office of the U.S. Department of the Interior, created on July 21, 1942, by the designation of the Secretary of the Interior as Fishery Coordinator, for the purpose of developing and assuring sustained production of aquatic food supplies essential to the conduct of the present war, and coordinating the policies, plans, and programs relating to war that affect the fishery industries and aquatic food supplies. The Secretary of Interior was delegated the responsibility for those portions of the war food program concerned with the production and processing of fishery commodities, including the allocation of production materials and facilities.

FLOOD CONTROL. Flood troubles and flood control or preventive measures continue to increase, and seem to pace one another, while the costs mount correspondingly. Practically every State is concerned with flood hazards and protective works. The aggregate cost estimated for works authorized and ready for construction is enormous, but beyond these are the works being planned for the future. Even allowing for the economic aspects of protection of property, public health and safety, and utilization of flood waters, the costs are staggering. Control measures include: (1) flood prevention by holding back excess water; (2) regulation of the flow or escape of these stored waters; and (3) protection against flood damage where excess flows are expected. It is estimated that in any large region the flood damage will be distributed thus: 75 per cent in headwater valleys, 15 per cent in cities, 6 per cent in the main valleys, and 4 per cent on tributaries. Destructive floods in large rivers attract public attention, but there is a vast annual aggregate of damage and death along hundreds of minor streams. Headwater control of main streams is but one factor in the problem.

Predictions of flood occurrences in long and short terms of years are essential in the design of many such works as bridges, dams, water supply and sewerage systems. Much research is devoted to the study of past, present and future conditions as to probable frequency and volume of floods. Forecasting and predicting are based on these studies.

The Federal program for general flood control and protection, under the War Department (Corps of Engineers, U.S. Army) began in 1937, and by June 30, 1945, there were 49 reservoirs and

114 local protection projects in operation. Many other projects, halted by the war, are now to be put under construction. Flood control works ready to be started in the fall of 1945 total \$833,000,000, while others ready by next spring total \$143,000,000. From 1937 to the middle of 1945, Congress appropriated \$605,742,000 for this program. The Flood Control Act, approved in December, 1944, authorized \$750,000,000 for 150 additional projects and continuation of works previously approved. In all, Congress has authorized \$1,680,400,000 for the construction of 650 reservoir and local protection projects. And supplementing all this, Congress has appropriated \$12,000,000 for emergency repairs to levees and other works damaged by the floods of 1944 and 1945. Plans are prepared by the Army engineers and the works are carried out under their direction. Requests for funds for projects are submitted to the Bureau of the Budget, which transmits them to Congress through the President. Work cannot be started until Congress has approved the project and appropriated the necessary funds.

Many projects including dams and reservoirs are of the multi-purpose type; that is, while flood control is the main purpose, the stored water may be utilized for irrigation, power development, municipal or industrial supply or, in rare cases, to assist navigation. During flood periods, the Army engineers have carried out an effective program of protection and rescue work in threatened and inundated areas.

On the Mississippi, levee reinforcement is in progress for some 200 miles, from Alton, Ill., to Cape Girardeau, Mo. Numerous types of paving or revetment are used to protect the slopes of the levees from erosion by waves and currents. To relieve New Orleans from the hazard of approaching high water, the Bonnet Carree floodway or channel above the city was opened, in March, diverting part of the Mississippi flood flow into Lake Pontchartrain. About 160 miles farther north is the Morganza floodway, to divert flood flows to the Atchafalaya valley. Extensive works are planned in the upper Mississippi, between St. Louis and St. Paul, on account of floods in early 1945.

The Ohio River program includes regulation by a series of reservoirs on the tributaries. With these completed, the maximum flood level at Pittsburgh (which averages a flood a year) will be reduced several feet. Since the disastrous Pittsburgh flood of 1936, eight storage dams (out of a program for 14) have been built on the Allegheny, Monongahela, and Beaver rivers. Along the Ohio there are numerous levees and flood walls; also pumping stations to handle interior drainage water. Work has been resumed on such improvements at Paducah, Evansville, Cincinnati, and Portsmouth. This last named place has a concrete flood wall 7,500 ft. long and 20 ft. high.

In Texas, a dam on the Trinity River will form a storage reservoir for the protection of Fort Worth and Dallas, and partial protection for Houston is provided by the recently completed Barker Dam on Buffalo Bayou. In California, a comprehensive program for dams and reservoirs for flood control is being handled by the State in cooperation with local authorities, the Army engineers and the Bureau of Reclamation. On the Illinois River, works for the protection of the East Peoria Drainage and Levee District have been completed. A score of dams on the Tennessee River and its tributaries form multi-purpose reservoirs, the discharge from which is operated as a unit system.

Several States are taking cognizance of the flood control problem. Illinois has a Legislative Flood Control Investigation Commission (1943), which made a progress report in 1945 and was continued to 1947. Indiana, Minnesota and Arkansas have similar organizations. Protective works at Syracuse, N. Y., include a dam and channel improvement on Onondago Creek. Five States in the New England region organized an Interstate Flood Control Commission in October, to cooperate with the Army engineers in completing a \$90,000,000 flood control project for the Connecticut River, on which \$29,000,000 has already been spent.

The new treaty with Mexico, ratified in April, provides for flood control works on the Colorado River and the Rio Grande. To relieve the city of Mexico from flood hazards, orders have been given for expediting work on the Tequiza drainage tunnel, which has been under construction for some years. To repair the damage done in Holland through the breaching of the coastal dikes by the Germans, the Netherlands Government has ordered from the United States a supply of excavators, tractors and other machinery, as well as 200 oil-engine pumping units to drain the flooded areas. See Dams.

E. E. RUSSELL TRATMAN.

FOOD AND DRUG ADMINISTRATION. Wartime enforcement of the Food, Drug, and Cosmetic Act was directed toward the maintenance of normal high standards of purity and truthful labeling, in the face of disrupted conditions that invited relaxation of controls. The Food and Drug Administration's regulatory work is performed through (a) the inspection of factories and warehouses for sanitation and processing controls maintained, and the condition of raw materials, (b) the collection and examination of representative samples of interstate shipments, and (c) the institution of actions in Federal courts when violations are encountered.

The wartime breakdown of normal sanitary controls in food establishments, particularly in storage warehouses, has been a serious aspect of the domestic food situation. Over 71 percent of food seizures in 1945 were based upon charges of filth and decomposition. While some manufacturers were careless about factory sanitation and used unfit raw materials, large quantities of food became contaminated with rodent, insect, and other filth after the food had arrived at its destination in sound condition. Highest in number of seizures were cereal products, including baked goods.

In 1945 the Administration continued to discourage attempts by a minority fringe to debase foods at the expense of consumers. Even after 4 war years, honest merchandise has not been undermined by "ersatz" products. Seizures of foods illegally cheapened with inferior ingredients were numerous, but were confined to a comparatively small group of operators, many of whom have been substantially penalized by the Federal courts. Another type of economic violation receiving concentrated regulatory attention was the shipment of foods below official standards, such as low-fat butter, and inferior grades of canned vegetables and fruits failing to bear the prescribed substandard legend. Since most of the standardized foods were rationed and important in the consumer diet, enforcement of standards was imperative. Every effort was made to return seized items to consumer channels after the goods were reprocessed when possible, as in the case of low-fat butter, or relabeled to correct the violation. Short-weight

and deceptively packaged foods were also seized and distribution was permitted only after the consumer deception had been corrected.

The principal objectives in drug enforcement were the maintenance of the purity and standard composition of medicines and the prevention of misbranding with false and misleading claims or with inadequate directions and warnings. Impurities, such as undissolved particles, in injection drugs, and lack of sterility, in surgical dressings, accounted for a large percentage of the substandard official drugs seized. Increased wartime use of home remedies resulted in a larger number of seizures of products ill-suited for the conditions for which they were sold than at any time since the 1938 Act became effective. Few of the items seized, however, bore claims for cancer, diabetes, tuberculosis, and other serious diseases requiring immediate rational medical treatment. Many were labeled with adroit references to disorders common to war-weary persons and represented an economic rather than a health danger to the purchaser.

Sample pre-testing of every lot of penicillin produced, previously done by the Administration under wartime controls, will continue under the 1945 penicillin amendment to the Act, passed unanimously after recommendation by the Administrator of the Federal Security Agency as essential to public health protection. Changes in drug regulations were issued to effect adequate labeling with directions and warnings on drugs suitable for self-administration.

New-drug applications, permitted to become effective, numbered 132. Estimation of the data accompanying such applications, to demonstrate safety for use and adequacy of manufacturing controls, is becoming more complex as new synthetic chemicals are developed and new uses are proposed for older substances.

Total seizures of foods, drugs, cosmetics, and caustic poisons in the fiscal year 1945 were 3,112. There were 380 criminal prosecutions brought against concerns charged with having made 1,268 violative shipments. The courts were requested to grant 35 injunctions to restrain further violations. Fines totaling \$164,856 were imposed by the courts in 269 criminal cases terminated in 1945. The highest fine was \$18,000, and in 44 cases fines were \$1,000 or more. Jail sentences were imposed upon 26 individuals, of which 13 were suspended and 13 actually served.

PAUL B. DUNBAR.

FOOTBALL. The gridiron game, given impetus by the sudden ending of the war, enjoyed a boom season in 1945, when all-time high attendance records were established in intercollegiate and professional circles. A total of 7,264,147 fans streamed into the stadia of seventy-five leading colleges and universities from coast to coast, making an increase of 1,888,536 over the previous year. The National League shattered all marks in its twenty-six-year-old history, when its ten teams played to 1,918,631 fans. In averaging 28,653 spectators for sixty-eight games professional football left no doubt that it finally has taken its place as a major attraction on the annual sports calendar.

The first postwar season also was notable for the return of many former stars from the service, some of whom joined their former college elevens at once to help the 17-year-olds who had carried on during the years of depleted manpower. Although the brand of play had not yet returned to its standard of 1940 and '41, the campaign held a goodly share of thrilling games.

When the season closed, experts the country over were unanimous in their choice of Army as the team of the year. The West Pointers, with the great Doc Blanchard and Glen Davis running behind a powerful line, truly earned the right to be called one of the outstanding intercollegiate elevens of all time. The Army-Navy contest, for the first time since 1941, returned to its familiar setting in the Philadelphia Municipal Stadium and when the Cadets routed the Middies by a score of 32-13 they completed their second straight campaign undefeated. Blanchard and Davis tallied all five of the touchdowns to give West Point its eighteenth straight triumph and the best record ever compiled by an Army outfit.

Blanchard, winner of just about every individual trophy in the sport, and his fellow All-American proved impossible to stop during the season as Army rolled over nine rivals, including such teams as Michigan, Duke, Notre Dame, and Pennsylvania.

While Army's powerhouse, which never was in danger of defeat, dominated the picture, several other good elevens emerged from the Autumnal scramble. Alabama was ranked second to the Cadets and the Crimson Tide went on to defeat Southern California in the Rose Bowl. Navy, beaten only by Army, but tied by Notre Dame, was rated third nationally.

Indiana, under the tutelage of the popular Alvin (Bo) McMillin, won the Western Conference championship for the first time in forty-six years and for that feat McMillin was acclaimed the season's outstanding coach. Southern California, when it defeated U.C.L.A. by 26-15 before 103,000 fans, clinched the Pacific Coast crown, while Texas won the Southwest title. Other group leaders were Penn, Ivy League; Alabama, Southeastern; Duke, Southern; Missouri, Big Six; Oklahoma Aggies, Missouri Valley; and Denver, Big Seven.

Southern California's record of never having lost in the Rose Bowl was badly marred last Jan. 1 when the Trojans were conquered by Alabama, 34-14, before a crowd of 93,000. The same day, the Oklahoma Aggies routed St. Mary's Gaels, 33-13, before 75,000 in the Sugar Bowl at New Orleans. The East All-Stars rallied to deadlock the West, 7-7, in the twenty-first annual Shrine contest at San Francisco; and Miami tripped Holy Cross, 13-6, on a last-minute pass interception in Miami's Orange Bowl. In other major games on New Year's Day, Georgia downed Tulsa, 20-6, New Mexico topped Denver, 34-24, and Texas beat Missouri, 40-27.

Pro football produced a number of rousing games and unexpected developments, the first surprise coming when the Chicago Bears, long a power in the National League, went toppling to one defeat after another, while the underrated Cleveland Rams skyrocketed to the top. The Rams annexed the championship of the Western Division and the Washington Redskins, after a mad scramble with Philadelphia's Eagles, took Eastern laurels. The play-off for the league title, held in Cleveland's Municipal Stadium in near-zero weather, produced one of the most thrilling contests of all time and ended with the Rams winning, 15-14, for the world pro crown. A new mark for play-off receipts was set when 32,178 fans paid \$164,542 to see the battle. Bob Waterfield of Cleveland was generally acclaimed as the leading pro star of the year.

The closing weeks of the National League campaign saw a bombshell dropped into the ranks of the old club owners when Dan Topping announced that he was joining forces with the newly-created

All-America Conference and that his Brooklyn Tigers, who in 1945 were merged with Boston, would play as the New York Yankees in the new circuit in the Fall of 1946, when the conference is to make its debut.

THOMAS V. HANEY.

FOREIGN AGRICULTURAL RELATIONS, Office of. A branch of the U.S. Department of Agriculture which has been collecting, analyzing, and disseminating information on foreign competition and demand for farm products and agricultural policy. Its primary purpose is to study the factors influencing the food supply and needs of foreign countries, competition, trade barriers, production and marketing, and other developments affecting American agriculture.

At the outbreak of the war, the work of the Office was focused on projects related to the war effort. Among these were the preparation of reports on the food situation and problem in enemy and Allied countries; preparation of handbooks on the agriculture of enemy-occupied countries, for the use of the Allied Military Governments; assistance in the formulation of plans for the relief and rehabilitation of agriculture in liberated areas; and the encouragement of production in the Western Hemisphere of tropical agricultural products formerly imported from the Far East.

Director: L. A. Wheeler.

FOREIGN AND DOMESTIC COMMERCE, Bureau of. A Bureau of the U.S. Department of Commerce, charged with promotion and development of United States commerce. Its operations are (1) of a general economic character, such as reviews of broad trends and developments; (2) of specific, practical application to current business problems. It also serves as the direct liaison between American business interests and the Government. However, activities of the Bureau largely concerned the provision of a quick service of comprehensive reports on commodities and industries at the request of war agencies. The Bureau functions through six divisions—Research and Statistics, Industrial Economy, Small Business, International Economy, Distribution, and Commercial and Economic Information. Director: Amos Taylor.

FOREIGN ECONOMIC ADMINISTRATION (FEA). During 1943 the foreign economic operations of the United States Government were consolidated in a single agency—the Foreign Economic Administration.

Established by Executive Order of September 25, 1943, the FEA represented an actual merger of several previously independent administrative units, whose separate identities were terminated. The consolidated agencies were: the Office (Board) of Economic Warfare (to which an Executive Order of July 15, 1943, transferred the U.S. Commercial Company, the Rubber Development Corporation, the Petroleum Reserves Corporation, the Export-Import Bank, and the foreign economic activities of all other Reconstruction Finance Corporation subsidiaries); the Office of Lend-Lease Administration; the Office of Foreign Relief and Rehabilitation Operations; and the economic operations of the Office of Foreign Economic Coordination.

Functions of the War Food Administration and the Commodity Credit Corporation, with respect to the procurement and development of food and food facilities in foreign countries, were also transferred to FEA by Executive Order of October 6, 1943.

In 1944 and 1945 FEA was given the responsibility for supervising the disposal of surplus property abroad and the procurement of goods in the United States for the United Nations Relief and Rehabilitation Administration, as well as procurement of essential civilian supplies for distribution by our armed forces during the period of military occupation. The FEA also undertook through the U.S. Commercial Company new activities in connection with the facilitation of trade with liberated areas, including purchases abroad of non-strategic materials where private trade was not possible, and domestic purchases of essential consumer goods for such areas.

On September 27, 1945, FEA was terminated by Executive Order and its functions were transferred to other agencies.

To the Department of State were transferred the lend-lease program; participation of the United States in the UNRRA program; activities in liberated areas with respect to supplying their requirements and the procurement of materials in those areas; the collection, analysis, and reporting of economic and commercial information abroad; and the planning of measures for the control of occupied territories.

Transferred to RFC were the U.S. Commercial Company, the Rubber Development Corporation, the Petroleum Reserves Corporation and their functions, capital stock, assets, and liabilities. The functions of the Administration (including those of the U.S. Commercial Company) with respect to the procurement of commodities abroad, excluding those transferred to the Department of Agriculture, also went to RFC.

To the Department of Agriculture was given the functions of the Office of Foreign Food Programs, except license control.

There were transferred to the Department of Commerce all functions of FEA and its agencies with respect to export control; the Technical Industrial Intelligence Committee (under the existing directive of the United States Joint Chiefs of Staff); the facilitation of trade, including functions affecting foreign trade and domestic commerce and the functions of the Clearing Office for Foreign Transactions and Reports; and all other functions not transferred to other agencies, including the final liquidation of the FEA.

The FEA activities transferred to the Department of Commerce have been placed in the newly created Office of International Trade Operations in the Department. Those functions transferred to the State Department are under the jurisdiction of the Liquidation Commissioner.

The FEA operated through two main bureaus, Areas and Supplies, which acted in cooperation with a number of staff offices.

Generally speaking, the Bureau of Areas functioned on a country or area basis. It was responsible for FEA policies relating to those countries and dealt with the State Department on clearance of all programs in the light of United States foreign policy. The Bureau also dealt directly with the representatives of foreign missions in Washington and supervised FEA's foreign missions.

The Bureau of Supplies was responsible for the execution of foreign economic programs on a commodity basis. Within the framework of country or area policies, it regulated the flow of exports, both Lend-Lease and commercial, and executed the foreign procurement and development operations. It was responsible for the related service functions such as warehousing, transporting, and shipping, and represented FEA on committees engaged in

the allocation of United States and world commodity resources.

The largest single task of the FEA was, of course, handling the lend-lease and reverse lend-lease programs. Export control was important throughout the war to insure against too great a drain on domestic supplies of commodities in short supply and to direct exports toward meeting essential needs of our Allies. The preclusive purchasing operations, whereby the U.S. Commercial Company sought to keep vital war materials such as chrome out of the hands of the enemy, ceased as the defeat of Germany drew nearer. Economic warfare studies of bombing objectives, blockade measures, and analyses of the enemy's economic strength shifted to the development of a program for the economic and industrial disarmament of Germany. In the past year, programs for meeting the essential needs of liberated areas and supplying UNRRA's requirements, were greatly expanded, since in many instances, government-to-government operations were the quickest means of supplying these requirements. The FEA procurement of critical and strategic materials abroad continued to be of primary importance to the success of the United Nations war effort until Japan was defeated.

ARTHUR PAUL.

FOREIGN EXCHANGE. The year witnessed a beginning of international monetary reconstruction following the drastic disruption of foreign exchanges and monetary systems produced by World War II. The measures adopted were of two main types. First, several countries took steps to reconstruct their own monetary systems, and to regulate their relations with other countries. Secondly, international cooperation to stabilize currencies and to finance reconstruction was assured by the adoption of the Bretton Woods Agreements. The International Monetary Fund and the International Bank for Reconstruction and Development, set up by these pacts, provided machinery for the solution of future foreign exchange problems through cooperative action.

America's Balance of Payments. The balance of international payments of the United States, by far the world's greatest trading nation, profoundly affects the foreign exchange position of other countries. Despite the huge surplus of exports from the United States over imports into this country, the balance of payments of the United States was unfavorable on a cash basis, with the result that foreign balances held in this country increased and gold was exported.

The United States Department of Commerce summarized the international transactions of the United States in 1945 as shown at top of next column.

Termination of Lend-Lease on August 21, 1945 changed completely the character of the United States balance of payments. Even if large loans are granted by the United States to finance reconstruction abroad, it is probable that this country will gain gold on balance for some time to come, owing to the overwhelming demand that exists for American products.

The Pound Sterling. Great Britain faced a very serious foreign exchange problem with the end of Lend-Lease. She had had to liquidate about half of her foreign investments during the war, while other countries, chiefly India and other members of the Empire, had built up balances in London exceeding \$12,000,000,000, which were blocked by exchange restrictions. In order to permit a large volume of foreign trade to go on

INTERNATIONAL TRANSACTIONS IN 1945

(millions of dollars)

We bought or otherwise acquired from foreign countries goods and services valued at	8,781
Of this amount, a portion was received under reverse Lend-Lease or other conditions not requiring payment.....	1,876
So we paid to foreign countries.....	6,855
Foreign countries bought or otherwise acquired goods and services from us amounting to.....	12,917
This figure, too, includes items not requiring payment, such as lend-lease and contributions to UNRRA, amounting to.....	6,139
Thus, of the dollars we supplied to foreign countries they used.....	6,778
As a result of transactions in goods and services, foreign countries had left.....	77

Net payments to foreign countries not otherwise accounted for.....	136
Hence, foreign countries were able to increase net dollar balances and purchase gold from the United States to the amount of.....	1,991

despite exchange controls, Great Britain had made herself the center of a sterling area within which transfers of funds from country to country could be effected almost freely, while transactions with outside countries were rigidly limited. Dollars received by sterling area countries were pooled and allocated by London among the members of the sterling area in the light of its over-all needs.

While Great Britain is scheduled to end foreign exchange controls and radically modify the operation of the sterling area under the Bretton Woods Agreements, these objectives are to be achieved only gradually and with the help of a huge dollar credit negotiated late in the year by a mission to Washington headed by Lord Keynes. In the interim, to permit immediate business dealings with other European countries, an agreement with Sweden was concluded on March 6, 1945, with France on March 27, and with Turkey, Denmark and Holland later in the year. Each of these agreements established a fixed rate of exchange between the pound sterling and these other currencies. The Swedish agreement, for example, provided that the Bank of England would make available Swedish kroner to British residents making payments to Sweden, while the Riksbank would provide pounds sterling in Sweden for similar purposes. In certain of these agreements, it was specified that each central bank would provide currency of the other up to a fixed amount only. These agreements contained a clause stating that each country would not change its currency parity without consultation with the other.

The Anglo-American Financial Agreement, made public December 6, granted Great Britain a line of credit of \$3,750,000,000, repayable in 50 annual installments starting December 31, 1951, with interest at 2 per cent. A feature of the credit was the provision that if the British balance of payments would not provide sufficient foreign exchange to pay interest, it was to be waived. In addition, Great Britain agreed to pay to the United States \$650,000,000 on similar terms in final settlement of Lend-Lease and for surplus American property and installations left in Britain by the American armed forces. As part of the Agreement, Great Britain agreed "to relax import and exchange controls, including exchange arrangements affecting the sterling area," and to cooperate with the United States in fostering freer trade. As an immediate sequel to the Agreement, Britain ratified the Bretton Woods pact.

Other Foreign Exchanges. France announced the devaluation of the franc on December 24, as a preparatory step for her adherence to the Bretton Woods Agreements. The rate of exchange was fixed at 119.0669 francs to the dollar, or approximately 85 cents per 100 francs. This compared with a rate of 50 francs to the dollar put into effect during the war. Following this devaluation, France was expected to join the trend towards multilateralism in foreign trade, and to move away from the policy of self-sufficiency and rigid controls advocated by the Communist Party.

Monetary inflation became increasingly pronounced in several countries in Southern and Eastern Europe. Britain negotiated a new credit to stabilize the Greek drachma, which was granted shortly after the end of the year. The Polish zloty, with a nominal value of 20 cents, was reported sold at 600 zloties per dollar in Stettin. The Yugoslav dinar, with an official rate of 2 cents, reportedly was traded at 250 or more to the dollar in the open market in that country. In some countries of Southern and Eastern Europe, there was hesitation to use the local currency as a medium of exchange in business transactions, owing to fears that drastic devaluations would be necessary, and barter flourished.

Latin American countries added further to their gold and foreign exchange holdings as exports continued favorable, while imports were limited by inability to purchase many desired products abroad.

The New York foreign exchange market had not resumed quotations for most European currencies by the end of the year. Quotations in December for all foreign exchanges quoted compared with those of the year before, or the date when trading was resumed, as follows:

FOREIGN EXCHANGE RATES

International Cooperation. The Bretton Woods Agreements Act, approving American participation in the International Monetary Fund and the International Bank for Reconstruction and Development, was approved by large majorities in Congress and went into effect July 31, 1945. The enabling Act set up a National Advisory Council on International Monetary and Financial Problems, headed by the Secretary of the Treasury, and comprising the Secretaries of State and Commerce, the Chairman of the Board of Governors of the Federal Reserve System and the Chairman of the Board of Trustees of the Export-Import Bank.

The Bretton Woods pacts provided that the signatories were to ratify their adherence by December 31. Ceremonies were held in Washington bringing the two international institutions into formal existence on December 28, and by December 31 ratifications had been received from thirty-six of the forty-five governments which had drafted the Agreements at the 1944 conference at Bretton Woods, New Hampshire. Russia and Australia were the chief countries that had not ratified at that time, although they could apply for admission at any time thereafter and be accepted by the governing boards of the International Fund and Bank.

Whenever the International Monetary Fund is ready to begin exchange transactions, members must communicate within thirty days the par value of their currencies. The par value must be based upon rates of exchange prevailing on the sixtieth day before the Agreements went into effect, except for countries whose metropolitan territory was occupied by the enemy during the war.

JULES I. BOGEN.

FOREIGN FUNDS CONTROL. A division of the U.S. Department of the Treasury, established in 1940, which is responsible for carrying out the economic and financial warfare programs of the Department under the Trading with the Enemy Act, as amended. In addition, the Control has been assigned responsibility for carrying out certain functions of the Treasury Department in areas liberated by the armed forces of the United Nations. Controls over finance, property, and foreign exchange similar to those in the United States were applied in liberated areas in order to maintain firm bases for military operations and to insure the full economic support of the areas against the enemy. Acting Director in 1945: Orvis A. Schmidt.

FOREIGN LIQUIDATION COMMISSIONER, Office of. Originally the Army-Navy Liquidation Board created by the Secretaries of War and Navy with the approval of the Surplus Property Board on Feb. 20, 1945, the Office of the Foreign Liquidation Commissioner, with Thomas T. McCabe as Commissioner, assumed its new name and was transferred by Executive Order to the Department of State on Oct. 20, 1945.

The Office controls and disposes of surplus military supplies overseas, excluding merchant ships sold by the Maritime Commission.

The Commissioner, as Special Assistant to the Secretary of State, heads the main office in Washington, D.C., and controls the activities of the field offices located in London, Paris, Rome, Cairo, New Delhi, Shanghai, Manila, Melbourne, Guam, New Caledonia, Ottawa, Canal Zone, and Rio de Janeiro.

After surplus property has been so declared by the owning agency, it passes to the jurisdiction of the liquidation commission for disposal. Maintenance until sale is the responsibility of the Army, Navy or other owning agency.

For administrative and disposal purposes, all surplus property is classified into consumer goods, scrap, raw materials, movable goods, real property, aircraft and combat material. Except for aircraft, which is sold through both headquarters and field offices, all sales are negotiated solely through the commissioner in each field area. Sales are correlated at the Washington headquarters which formulates policies and coordinates global sales activities. Foreign currency may be used through special arrangement with the field commissioner.

Priority is granted to purchasers as follows:

1. United States Government agencies abroad. (UNRRA has been the largest customer.)
2. Non-profit institutions.
3. American firms, for their trade-marked surplus, to be sold abroad.
4. Foreign governments anywhere, for their reconstruction and rehabilitation.
5. Foreign governments where surplus is located.
6. All others.

As of January 31, 1946, total sales amounted to \$135,000,000, additional contracts totaling \$171,000,000 had been executed.

The Commissioner anticipates that surplus material overseas will eventually total the 4,000,000 items it took to win the war.

The functions of the former Foreign Economic Administration pertaining to lend-lease affairs and United States participation in the operations of UNRRA were transferred on October 20, 1945 to the Office of the Foreign Liquidation Commissioner.

THOMAS B. McCABE.

FOREIGN-TRADE ZONES BOARD. A Board created under the Department of Commerce in 1934 to provide for the establishment, operation, and maintenance of foreign-trade zones in ports of entry of the United States. The Chairman is the Secretary of Commerce. Applications were under consideration during 1945 for the establishment of zones at New Orleans, Houston, San Francisco, and San Juan, Puerto Rico.

FOREST SERVICE, U.S. Many of the emergency activities in which the U.S. Forest Service was engaged during the war were brought to a close with the cessation of hostilities. The Timber Production War Project, started in 1943 to facilitate increased production of lumber, pulpwood, and other timber products urgently needed for war uses, was terminated after having stimulated production of more than 8 billion board feet of forest products in states east of the Great Plains. Approximately 25,000 prisoners of war were trained for woods work by project foresters during the two years the project operated.

The Forest Service also closed down operation of its Alaska Spruce Log Program, begun in 1943 to help meet a pressing war need for spruce lumber for aircraft construction. During the life of the project, 38 million feet of high-grade spruce logs were cut from the Tongass National Forest in Alaska and rafted 900 miles to Puget Sound mills. In addition, approximately 46 million feet of lower-grade material was supplied to Alaska sawmills for the construction needs of the armed forces in the Territory.

The Emergency Rubber Project was expected to be liquidated by June, 1946. This project was authorized by Congress in 1942 to provide a domestic source of natural rubber when foreign sources were cut off by Japanese aggression. The Forest Service was assigned the task of developing a seed supply, growing the nursery stock, and planting several thousand acres of guayule, a native Mexican rubber-bearing shrub. During 1945, harvesting and processing of shrub from some of the 31,356 acres of guayule plantations established under the project was carried on. Two processing mills, at Salinas and Bakersfield, California, were in operation. Plans for the construction of four additional rubber mills, to be operated under contract by the Firestone Tire and Rubber Company, were cancelled when the war ended. Some 20 million nursery seedlings were sold to a Mexican

rubber company, which has started a guayule planting program expected to reach 15,000 to 20,000 acres. Results of Forest Service experience with guayule planting and milling techniques were made available to the Mexican Government. A sale of approximately 20,000 pounds of guayule seed was made to Argentina.

To bring its information up to date, the Forest Service in 1945 began a re-appraisal of the forest situation in the United States. The re-appraisal project called for a review of existing data, on-the-ground checks, and careful analyses to determine the amount of timber now standing in the forests, the current rates of growth and drain, the condition of forest lands, and how they are being managed. Completion of the study was not expected before 1946.

Postwar Program. Plans for needed work for the postwar development of the national forest system were prepared by the Forest Service. Normal maintenance work had been largely suspended during the war, and many forest roads and other facilities were in run-down condition. New work planned included building additional forest highways; gaining access to undeveloped areas through construction of forest roads and trails; expansion of facilities for fire protection; tree planting; thinning, pruning and improvement work in young timber stands; range improvement; upstream work on watersheds to reduce floods; and recreational improvements. Planned work, including cooperative work on state and community forest lands, called for an expenditure of about \$2,215,000,000 over a 6-year period. How rapidly such work will progress depends, however, upon appropriations of funds by Congress.

Not only in the national and State forests but on private forest lands over large areas, restoration and improvement work was needed, the Forest Service reported. In World War I, some 6 billion board feet of lumber was used for war purposes in 18 months. World War II required this amount every four months for 3½ years. The annual drain on the country's forests was substantially in excess of annual growth. The Chief of the Forest Service in his annual report for 1945 stated that too much forest land is still being stripped of its timber and left incapable of further production for years to come. The United States, he said, cannot continue to eat into its forest capital and reduce the productive capacity of its forest land without serious consequences. In order that the supply of wood may be continued from year to year without interruption, a growing stock of timber must be built up and maintained so that the volume cut is constantly being replaced by an equivalent volume reaching merchantable size, in places where it can be utilized economically. He estimated that the forests of the United States, if brought up to full productivity, could furnish permanent employment for some 2,500,000 workers in addition to the 3,750,000 now supported by forest industries and activities.

Forest Products Research. Recent technological advances in wood utilization point to an increasing demand for wood. The Forest Products Laboratory, maintained by the Forest Service at Madison, Wisconsin, accomplished some striking results in increasing the value and usefulness of wood products during the war years. Laminated wood, improved plywoods, and wood and paper base plastics are finding a widening variety of uses. Such laboratory products as "impreg," "compreg," "papreg," "staypak" and the "uralloys" are being adapted to industrial usage. The Laboratory has developed

the technical information upon which can be based an industry for the production of industrial alcohol from wood on a scale sufficient to meet any conceivable demands.

Among the new developments announced by the Forest Products Laboratory was a process by which alpha cellulose can be produced from wood in greater quantity per unit of raw wood and in purer form than was possible by existing pulping methods. The process makes possible the use of wood cellulose for such special products as sausage casings and rayon for truck tires. Chemically, the product is similar to cotton linters alpha cellulose. The process yields, on a commercially feasible basis, 48 to 50 percent of high-grade alpha cellulose from semi-chemical wood pulp, as compared with yields of about 38 percent from present pulping processes. The purity of the product and the approximately 25 per cent increase in yield enhance its commercial possibilities.

Another Forest Products Laboratory development was a superior glued, laminated wood product, with joints that endure the ravages of fresh or salt water, weather, and severe conditions of heat and moisture. It was produced by the use of special synthetic resin adhesives and a curing technique developed by the Laboratory. This process was developed when the Navy's shipbuilding requirements for large-size, high-grade, solid timbers could not be met by lumber producers. With the new process it is possible to produce laminated timbers and other wood products suitable for most uses to which solid wood can be put, including structural timbers, arches, ready-shaped members, implement and tool parts, and prefabricated building parts. Gluing permits the fabrication of large members from material of small size. The use of dry lumber reduces seasoning defects incident to the drying of large green timbers. Likewise, material defects, which reduce the usefulness of solid wood products, can be eliminated in the laminated product.

"Wood sandwich" constructions (soft, lightweight core material with thin, high-strength facings) were adapted by the Laboratory for use by the armed forces as skins for wings and fuselages in the development of new high-speed aircraft. Wartime conditions restricted the use of sandwich constructions to aircraft, but they have broad peacetime uses in products requiring combinations of high rigidity, light weight, and sound or heat insulation. Potential uses include wall panels, flooring, refrigerator cars, boats, automobile bodies, doors, and special shipping containers.

By developing and adapting pulp-making processes to hitherto little-used wood species and wood wastes of lumber camps, sawmills, and veneer mills, the Forest Products Laboratory helped paper manufacturers overcome shortages in raw materials, labor, and transportation facilities during the war. Hardwood "weed" species were shown to provide substantial reserves of pulpwood, in many instances relatively close to mills accustomed to obtaining supplies from distant areas, thereby reducing the heavy burden on railroads and trucking lines. Laboratory research demonstrates that these little-used hardwoods could yield profitable quantities of pulp for newsprint, book and magazine papers, wrapping paper, and other products. This should help to broaden the base of pulpwood supply by promoting utilization of neglected species which have come to predominate in many cut-over areas from which preferred species have been removed.

It is estimated that two-thirds or more of the

wood volume in the average tree is wasted. Millions of tons of wood in the form of tree tops, broken trunks, cull logs, and inferior species are left in the forest because it costs more to collect it and move it to market than it can be sold for. Improved techniques that will reduce the cost of logging, assembling and transporting the material, and that will bring neglected species into use, will help to bring this potential supply of raw material into commercial use. The development of diversified manufacture, so that the waste or by-product of one plant will become the raw material of another, also will make for more complete utilization of the forest crop and thus help in some measure to close the gap between annual timber growth and drain.

To encourage such developments, the Forest Service in 1945 established two regional units, each consisting of a small corps of technical experts in forest products utilization. These men were assigned to bring research findings to industry, assist in commercial application of new discoveries, transmit to the Forest Products Laboratory problems that required special investigation or advice, and otherwise work to promote improved forest utilization. Five additional regional forest utilization units were planned in 1946.

World Forestry. A report to the governments of the United Nations in 1945 by a technical committee on forestry called attention to the fact that in the face of rapidly multiplying uses for wood and ever-mounting wood needs, the world's forest resources are steadily diminishing. The technical committee was set up in 1944 by the United Nations Interim Commission on Food and Agriculture, with Dr. Henry S. Graves, dean emeritus of the Yale University School of Forestry, as chairman. Its membership included representatives of nine nations. American members were: Lyle F. Watts, Chief of the U. S. Forest Service; Walter C. Lowdermilk, Assistant Chief of the Soil Conservation Service; and Tom Gill, Secretary of the Charles Lathrop Pack Forestry Foundation.

The report said that less than 15 percent of the world's timberlands are being handled as a renewable, continuously productive resource. Two-thirds receive neither care nor protection.

The report recommended establishment under the United Nations organization of a permanent international forestry agency for the collection and unification of forestry information and to aid member nations in the solution of their forest problems. Most important of the specific problems cited for special attention were: (1) Restoration of Europe's war-depleted forests; (2) extension of sound management in countries whose reserves of old timber are in process of depletion; (3) reforestation in southeastern Asia and the Middle East as an indispensable step in soil improvement, more efficient agriculture, and higher nutritional levels; (4) initiation of forestry measures in the largely unexploited wood surplus countries, such as the Latin Americas and Equatorial Africa; (5) effective world-wide distribution of forest products; (6) world-wide correlation of the results of research in forest management and wood utilization; (7) coordination of forest production and utilization with soil and water conservation as well as with other land uses and services, such as wildlife and grazing.

Fortieth Anniversary. The U. S. Forest Service observed its fortieth anniversary in 1945. It was established in 1905 when the earlier Bureau of Forestry was reorganized and the forest reserves (later re-named national forests) that had been

set aside from the unreserved public domain were placed under its jurisdiction. Governmental forest work actually began in the Department of Agriculture in 1876, with the appointment of a commissioner to study forest conditions in the United States. In 1881 a Division of Forestry was set up, and in 1901 this became the Bureau of Forestry. Through these earlier periods, however, the government's forest work amounted to little more than compilation of information and statistics.

In the past 40 years the Forest Service has been the spearhead of the whole conservation movement in America. It has developed sound forestry techniques applicable to American conditions, and the national forests under its administration have become the world's outstanding public forest system. At an anniversary meeting of members of the Service, however, Chief Forester Watts said that the biggest jobs lie ahead. The downward trend of the nation's forest resources, he said, has yet to be reversed. The bulk of the country's forest lands are still handled with little regard for future productivity. Large areas of depleted land need to be restored to usefulness. He pledged the Forest Service to renewed effort in a program of forest improvement and development that would make the forests play their full part in serving the welfare of the nation and its people.

LYLE F. WATTS.

FORMOSA (Taiwan). An island near the southeast coast of China. It was under Japanese control from 1895, when it was ceded by the Chinese to the Japanese, until V-J Day in September, 1945, after which the Chinese resumed the administration of the island. Total area, including the Pescadores: 13,889 square miles. Total population (Dec. 31, 1940): 6,077,478 (91.5 percent Formosan Chinese, 6 percent Japanese, and 2.5 percent aborigines). Chief towns (1935 census): Taihoku (capital), 278,446; Tainan, 111,959; Keelung, 84,978; Takao, 83,735.

Production, etc. The principal agricultural products are: rice, sugar, tea, sweet potatoes, ramie, jute, and turmeric. Camphor is obtained from the forests. Livestock (1937): 1,849,195 pigs, 282,101 buffaloes, 76,341 cattle, 70,384 goats. Minerals produced include gold, silver, copper, coal, and oil. Foreign trade (1939): imports Y408,649,840; exports Y592,938,199 (yen averaged \$0.2596 for 1939; \$0.2344, 1940). Budget (1940-41): Y269,457,562.

FOUNDATIONS. Few structures requiring deep or difficult foundations are undertaken in wartime, since such works involve considerable time and cost. Deep and submerged foundations present the most serious difficulties, and the proposed Mississippi River highway bridge at New Orleans will require deep foundations in soft alluvial soil. Shallow foundations also may offer problems, as illustrated at a housing project on soft ground where settlement of the buildings had to be considered. The solution was to excavate to basement level for each building (35 x 50 ft.) and then, in each basement, to drive 14 holes, 4-in. in diameter, to depths of 20 to 30 ft. The holes were then grouted with cement to consolidate the soil and support the footings.

Earthquake shocks and tremors have to be considered in some localities, as at the Kentucky Dam of the Tennessee River. A multi-story U.S. Army hospital in Hawaii has some footings on rock at shallow depths and others on concrete piers sunk to rock at considerable depths. All are

reinforced by steel H piles and are tied together by a system of concrete beams.

For the new Pecos River bridge of the Southern Pacific Ry., in Texas, with earthquake forces a factor in the design, the tall concrete piers, 275 ft. high, are made hollow as a means of reducing horizontal movements. Somewhat similar conditions exist at the new Colorado River bridge of the Santa Fe Ry. at Topock, Arizona. Here the pneumatic caissons of one concrete pier had to be sunk to the exceptional depth of 123 ft. below water level to reach a firm stratum. This required special working conditions, with 52-lb. air pressure in the caisson, so that the men worked in shifts of only 30 minutes. With the caisson in place, the solidity of the rock was tested by drilling holes to depths of 20 to 25 ft. below the caisson.

The new Montgomery Dam on the Ohio River, 32 miles below Pittsburgh, is founded on a row of open steel caissons (not requiring pneumatic pressure) which were filled with concrete after being landed on rock. For the foundation of the 145-ft. Rincon del Bonete Dam, in Uruguay, the seamy rock was consolidated by drilling and grouting. This was done in successive steps of 13 ft., each step being left to set or harden before drilling and grouting the next step. A Pacific coast dry-dock of the U.S. Navy, with its concrete walls in 30 ft. of water and 60 ft. of soft soil, is founded on rock-filled trenches in which sand-piles were formed by jetting holes and filling them with sand pumped in through the jet pipe. For a Navy pier in the same locality, but founded on firm sand and gravel, some 2,400 concrete piles were driven 20 ft. into the soil. These piles were 18 in. square and 50 to 80 ft. long, each with a pipe in the center for jetting water through the point to facilitate the driving.

Interesting work has been done in prospecting the foundation conditions for proposed structures. Study of the rock bed of the Columbia River for a dam below The Dalles, Oregon, has been made by divers under difficulties, the water being 200 ft. deep and flowing with so swift a current as to require the use of anchored cables to prevent the men from being swept downstream. Seismic methods of prospecting have been used in locating a rock bed for a dam at Hemlock Lake, to increase the water supply of Rochester, N. Y. Dynamite charges are exploded in drilled holes at specific depths and the vibrations are recorded by delicate instruments in a mobile or truck-mounted seismic laboratory, said to be the only one in existence. These records indicate the character of the soil through which the vibrations pass. See BRIDGES, BUILDINGS, DAMS, FLOOD CONTROL.

E. E. RUSSELL TRATMAN.

FRANCE. A republic in western Europe. Area: 212,659 square miles. The estimated population (July, 1945) was 39,677,000, compared with (1936 census) 41,907,056. Vital statistics (exclusive of Alsace-Lorraine and Corsica) for 1943 (rate per 1,000): births 15.9, deaths 16.4; infant mortality 75 (deaths under one year per 1,000 live births).

Chief cities (with 1936 census figures): Paris (capital) 2,829,746, Marseille 914,232, Lyon 570,622, Bordeaux 258,348, Nice 241,916, Toulouse 213,220, Lille 200,575, Nantes 195,185, Strasbourg 193,119, Saint-Etienne 190,236, Le Havre 164,083, Toulon 150,310, Rouen 122,832, Nancy 121,310, Reims 116,687, Roubaix 107,105, Clermont-Ferrand 101,128.

Education and Religion. No recent statistics on education are available. The French Government

in 1945 announced various educational reforms. Among them were the creation of the National School of Government Service to replace the Free School of Political Science and the establishment of a new first grade in secondary schools. Roman Catholicism is the religious faith of most of the people; there were about a million Protestants.

Production. In prewar times 38 percent of the population was engaged in agriculture, 31 percent in industry, and 11.5 percent in commerce. Land used for agricultural purposes in 1938 was equal to 62 percent of the total area. Exclusive of Alsace-Lorraine the yields of the main field crops during 1944 (in metric tons) were: wheat 6,460,000, potatoes 6,600,000 (1943), sugar beets 6,000,000 (1943-44). Other major branches of agriculture are livestock raising, dairying, vineyards, and fruit cultivation. In 1944 the output of wine totaled 1,028,818,000 U.S. gallons. Livestock (1945 est.) 14,800,000 cattle, 6,900,000 sheep, 5,900,000 pigs, and 2,300,000 horses. Meat output (1945 est.): 1,000,000 tons.

Mineral and metallurgical output in 1944 (exclusive of Alsace-Lorraine) was as follows (in metric tons): coal 25,260,000, pig iron and ferroalloys 1,104,000, steel 1,272,000, aluminum 26,400. In October 1945 the output of coal totaled 3,756,000 tons. The production of electricity (exclusive of Alsace-Lorraine) in 1944 totaled 13,608 million kwh. Based on the prewar value of output, the leading manufacturing industries were metal working, machinery, and metal products; food; chemicals; textiles; metallurgy; embankment work and stone construction; wood; rubber; paper, and cardboard; leather and hides.

Defense. Plans for the reorganization of the French armed forces call for a minimum of 65,000 men in the navy and 500,000 men in the army. According to a statement released (Dec. 28, 1945) by the French Ministry of Information, Gen. Jean de Tassigny has asked for 105,000 men to be stationed in France, 100,000 in North Africa, 120,000 in the Far East and the colonies, 120,000 troops for the occupation of Germany, and 55,000 military police. Men will be called for compulsory military service at the age of 19 and will serve for a period of 13 to 14 months.

Foreign Trade. As a result of the occupation of France by German armed forces during World War II, not many products were available for export in 1945. In the twelve months of 1945 the value of imports was 54,839,766,000 francs; exports, 11,396,858,000 francs. For the year 1944 imports were valued at 7,740,000,000 francs; exports, 23,964,000,000 francs. The principal imports into France for consumption included wheat, corn, rice, vegetables, fruits and nuts, sugar, wines, hides and skins, cotton, wool, wood and cork, wood pulp, rubber, coal, petroleum, copper, machinery, oil-seeds, and chemical dyes. In prewar years the chief export products included wine, brandy and liqueurs, hides and skins, wool, cotton fabrics, rayon and silk fabrics, paper and cardboard, iron ore, iron and steel, metal manufactures, machinery, automobiles, vegetable oils, chemical dyes, and perfumery.

In 1938, exclusive of French territories and possessions, the principal suppliers and markets (by value of products) were Belgium, Great Britain, the United States, and Germany. See *Statistical Year-Book of the League of Nations*, 1942/44 (Geneva: 1945), page 191, for yearly totals of imports and exports during World War II.

Finance. France's budget for 1946, according to estimates submitted to the finance commission of

the Assembly on Dec. 6, 1945, will total 464 billion francs, including 200 billion for civil expenditure, 59 billion for liquidation of the war, 125 billion for military costs, and 80 billion for reconstruction. Budget (1945): revenue 172 billion francs; expenditure 384.3 billion francs. In 1944 revenue totaled 123.46 billion francs; expenditure 364.56 billion francs, including German occupation charges amounting to 198.7 billion francs. The internal public debt of France increased from 445.7 billion francs on Aug. 31, 1939, to 1,734.6 billion francs on Apr. 30, 1945.

Currency notes in circulation rose from 151.3 billion francs on Dec. 31, 1939, to 496.3 billion francs on Sept. 30, 1945. Notes of the Bank of France had to be presented for exchange against new notes between June 4 and 15, 1945. After that date old notes ceased to be legal tender.

The official exchange rates for the franc in 1945 (until December 27) were: 49.53 francs equal U.S.\$1; 200 francs equal £1 sterling. On Dec. 27, 1945, by a vote of 506 to 44, the National Constituent Assembly adopted a law for the devaluation of the franc, as follows: The French (metropolitan) franc was pegged at 119.10669 francs = U.S.\$1 and 480 francs = £1 sterling. With regard to overseas territories the government decided to modify the value of currency in certain colonies with relation to the French (metropolitan) franc. As a result of these decisions, the "franc zone" will include three sectors in overseas territories:

(1) The currency of Algeria, French Guiana, French West Indies, Morocco, and Tunisia will remain at par with the French franc and have the same foreign exchange value.

(2) French Cameroun, French Equatorial Africa, French Togo, French Somaliland, French West Africa, Madagascar, Réunion, and St. Pierre and Miquelon will be able to exchange 100 of their own francs against 170 French francs. Their franc will have an exchange value of 70.06 francs = U.S.\$1 and 282.35 francs = £1 sterling.

(3) New Caledonia, New Hebrides, and French territories in Oceania will follow French colonies in the Pacific where the local franc is and will continue to be valued at 100 francs to 240 French francs. The U.S.\$1 and £1 sterling were fixed at 49.627 francs and 200 francs, respectively.

Currency in the "franc zone" which is known under a name other than franc will have the following exchange values in French francs: 1 Indo-chinese piaster = 17 French francs; 7.006 piasters = U.S.\$1; 28.235 piasters = £1 sterling. The French rupee was valued at 36 French francs but retains the old exchange value to the U.S.\$1 and £1 sterling. The Syrian-Lebanese £ was valued at 54.35 francs but has the same parity as before with foreign currency.

The Bank of France and four large deposit banks (Crédit Lyonnais, Société Générale, Comptoir National d'Escompte, and Crédit Industriel et Commercial) were transferred to state control on Jan. 1, 1946. Local and regional banks were not subject to nationalization, nor were commercial banks engaged primarily in foreign operations.

Transportation. The highway network of France extends for a total of 2,072,027 miles, made up of 49,821 miles of national roads controlled by the state, 155,831 miles of departmental roads administered by the departments, and 1,866,375 miles of local roads maintained by the communes. The main railway lines in France are operated by an autonomous government corporation organized through the amalgamation in 1938 of two systems owned by the government and four by private

interests representing a total of 39,176 miles of operated trackage, mainly of standard gage. In addition there are a number of small private railroads. On Jan. 1, 1945, only 7,343 steam and 582 electric locomotives, 172,048 freight cars, and 9,000 passenger cars were in immediate working condition. French airlines operate networks in metropolitan France, and to North Africa, West Africa, the Near East, Madagascar, and other points in the world. There are 7,400 miles of navigable inland waterways, for the transportation of heavy bulk commodities. About 50 million metric tons were loaded each year on inland waterways during prewar years.

Events, 1945. For France the year 1945 was an interim between liberation and the establishment of the Fourth Republic. The *entre-acte* was a tragic comedy of peace, offering a surcease from sudden death but no promise of abundant life; of lost glory, always eluding eager pursuers; of inflation and hunger, which were constant companions of *les misérables*; of frustration in diplomacy, born of the marriage of national impotence and vaunting ambition to restore *La Grande Nation* to the rank of a Great Power; and of realignments and fresh beginnings in domestic politics, looking toward a new day.

The Grandeur of Victory. On New Year's Day, 1945, Ambassador Henri Bonnet signed the United Nations Declaration in a ceremony at the State Department. Roosevelt's message declared: "France was the first ally of our country in our own war of liberation. . . . And now France stands beside us as a strong ally—once more in the first rank of the free and peace-loving nations of the world." French enthusiasm at formal membership in the Allied coalition was dampened a fortnight later by the imposition of stringent restrictions on train service and public utilities due to the coal shortage. De Gaulle attributed the new austerity to the "rash conceptions" of Anglo-American leaders regarding German capacity for resistance. The General-President's appeals for national greatness through sacrifice evoked a popular echo, since they reflected the hurt pride of an embittered people. "We must make an enormous effort," asserted De Gaulle on February 5, "to raise ourselves to the rank where we wish to be. For the moment the demands, the tests, and the ruins of war are limiting us to the most pressing needs—that is, simply to make every effort to stay alive. But, as the sun of victory rises on the horizon, the nation is discovering the future . . ."

The French contribution to V-E Day was dependent upon American aid. After protracted negotiations Jean Monnet returned to Paris in February with drafts of lend-lease accords which the Cabinet approved. On February 28 the pacts were signed in Washington. Apart from armaments, the agreements made provisions for the transfer of \$1,675,000,000 worth of civilian supplies and \$900,000,000 worth of locomotives, railway cars, ships, and machinery, with deliveries to continue after the end of hostilities and to be paid for by the French government in installments at 2% interest. Reverse Lend-Lease materials supplied by France to American forces during the year following the Normandy landings were estimated to have a value of \$400,000,000. The French role in the closing campaigns of the war, while not decisive, was by no means insignificant. Paris was consulted regarding the armistice terms and participated in the ceremonies of signature in Reims and Berlin, May 7-8, 1945. De Gaulle's broadcast declared: "This is victory. It is the victory of the United Na-

tions and of France. . . . While the rays of glory once again lend brilliance to our flags, the country turns its thoughts and affections first of all toward those who died for her and then toward those who in her service struggled and suffered so much. . . . Honor to the United Nations, which mingled their blood, their sorrows and their hopes with ours and who today are triumphant with us. *Vive la France!*"

The Misery of Victory. The rebirth of France, after catastrophe and enslavement, was made possible by the armed might of Britain, America, and Russia. The nation was physically and spiritually impoverished by its ordeal. It emerged dazed, as from a nightmare, into a dull dawn of penury and doubt. These circumstances explain the wounded vanity, the morbid sensitivity and the peevish obstinacy which so often found expression throughout the year in the words and acts of French leaders in grappling with their problems at home and abroad. While still in the midst of war, French politicians, patriots, and pressmen felt hurt that De Gaulle was not invited to join Stalin, Churchill, and Roosevelt at Yalta. Through Tass, Moscow took pains to deny an AP report of mid-January that Stalin and De Gaulle had struck a bargain in December by which the U.S.S.R. would urge Britain and the United States to include the French leader in the meetings in return for French support of Soviet aspirations in Eastern Europe. As the Crimea Conference ended, Maurice Schumann opined in *L'Aube* that fear of social change had "distorted the judgment and retarded the choice of the ruling classes of the United States and the British Empire."

The Anglo-American-Soviet invitation to Paris to participate in the San Francisco Conference, in plans for liberated Europe, and in the military occupation of Germany were resented rather than welcomed because of French exclusion from the original decisions and the alleged paucity of information supplied regarding them. De Gaulle declined Roosevelt's invitation to visit him in Algiers in mid-February. *L'Aurore* commented: "Not too much coquetry! . . . Bad humor is not a sign of strength!" Roosevelt's death two months later produced remorse and new criticisms of De Gaulle's attitude. Another manifestation of pique was French refusal to join Washington, London, Moscow, and Chungking as inviting powers in sponsoring the San Francisco Conference. The reason given, and later incorporated in French reservations and amendments—i.e. lack of assurance that the French-Soviet alliance would remain intact under the Charter—proved to be baseless and was repudiated by the Soviet press. The French delegation at San Francisco was headed by Foreign Minister Bidault and included René Pleven, François Billoux, Henri Bonnet, and Joseph Paul-Boncour.

The quest for recovery from the ravages of war, like the quest for Great Power status, was only half successful. Large scale devastation was limited to Normandy. Nazi terrorism, however, had been wide-spread throughout France. A 13-volume report by the Psychological Warfare Section of SHAEF, released on May 3, revealed scores of mass executions by enemy forces and thousands of instances of unspeakable atrocities. Administration in the zones of the Reich assigned to France was correspondingly harsher than in the British and American areas, as was French treatment of German prisoners—a circumstance which provoked criticism from American Army HQ, followed by the transfer to American camps in mid-October of 90,000 sick and undernourished POWs. The cost of the German occupation was estimated on August 1 at \$98,000,000,000—far beyond recovery from the

share of réparations assigned to France at Potsdam.

French economy throughout the year was afflicted with inflation and extensive black market operations. The poor suffered semi-starvation while the middle class was progressively impoverished. On Christmas Day the Finance Ministry announced the devaluation of the franc to 119.1 to the dollar and 480 to the £. Whether corresponding increases in prices could be sufficiently limited to halt further inflation was doubtful by the close of the year.

Purgatory. The continued purge of Vichyites and collaborators was marked by numerous dramatic trials. State Prosecutor André Mornet pledged himself in mid-March to bring Pétain to trial within two months. On April 24 the 89-year-old Marshal arrived in Switzerland from Germany and surrendered two days later on the French border. During the preliminary interrogation and the treason trial which opened July 23 in the Paris Palace of Justice, he was accused by ex-Premiers Reynaud, Daladier and Blum of plotting with the fascist Powers ever since 1934 to destroy the Republic. Pétain contended that he had acted in 1940 and thereafter in accordance with a secret agreement with London, the existence of which was denied by Churchill. The erstwhile Chief of State at Vichy refused to answer questions as to whether he had sent congratulations to Hitler after the Dieppe raid and had asked that French troops be permitted to fight the Allies. A letter to Pétain from Admiral William D. Leahy, U.S. Ambassador in 1941-42, praised the Marshal for his concern with "the welfare and protection of the helpless people of France," but reproved him for bowing to Axis demands. Judge Pierre Mongibeaux of the High Court of Justice summoned Fernand de Brinon and Joseph Darnand as witnesses with the approval of the defense and over the objections of the prosecution. Both of these Naziphiles testified that Pétain had been consistently pro-Nazi. On August 15 he was judged guilty of "intelligence with the enemy" and given a death sentence—accompanied, however, by a recommendation of clemency. Two days later De Gaulle commuted the sentence to life imprisonment. The culprit was incarcerated in Fort Portalet in the Pyrenees to spend his remaining days in disgrace and perhaps in repentance.

Meanwhile Pierre Laval, evil genius of the French debacle, arrived in Barcelona by plane from Germany on May 2. Not until the end of July did the Franco Government order his expulsion. He surrendered to American forces in Austria, but was delivered over to Paris where he was imprisoned August 1. His trial opened early in October and was marked by many stormy scenes, culminating in his exclusion from the court room. On October 9 he was sentenced to death, confiscation of his property, and national degradation. On October 14, after a vain attempt to take his own life by poison, he was shot by a firing squad outside of Fresnes prison.

Among other collaborators judged guilty by purge courts were Charles Maurras, sentenced to life imprisonment on January 27; Admiral Jean-Pierre Esteva (life, March 15); Fernand David (death, April 14); Marcel Déat in absentia (death, June 19); Joseph Darnand (death, October 3); and Jean-Hérod Paquis (death, October 11). General Henri-Fernand Dentz, sentenced to death April 20, had his penalty commuted by De Gaulle, but died in prison on December 13. Joseph Barthélemy, Vichy Minister of Justice, died on May 15 before being brought to trial. Jacques Doriot was reported on February 23 to have been killed in

Germany in an air raid. Jacques Lemaigre-Dubreuil and Jean Rigaud, members of the Darlan-Giraud regime in North Africa, had the charges against them dropped on May 14, after Robert D. Murphy intervened on their behalf. The purge promised to continue into 1946, but under normal, rather than exceptional, court procedures, as voted by the Constituent Assembly on December 13.

De Gaulle Abroad. The crusade to enhance French diplomatic prestige to which the leader of the liberation was driven, both by his own convictions and by the exigencies of his political position at home, suffered many reverses. The heaviest blow was the loss of Syria. Early in May fighting broke out in Damascus between French troops and Syrian police. Following the failure of negotiations to end hostilities, Churchill, with Truman's approval, dispatched a virtual ultimatum to De Gaulle on May 31 demanding that he order French troops to cease firing and return to their barracks. Having no power to refuse, De Gaulle complied but blamed Britain for violating the Levant Accord of 1941, concentrating troops in Syria and Lebanon, plotting against French interests, and surreptitiously arming the natives. His proposals for a Five-Power Conference on Near Eastern problems were rejected by London. At the end of June Paris refused to permit French officers to be decorated at the British Embassy and deported Lady Spears, wife of Maj. Gen. Sir Edward Spears, former British Minister in Syria.

In a mood of futile wrath, French spokesmen voiced suspicions of the motives of British officials and American oil companies in Syria and reluctantly agreed in late July to turn over all important garrisons to the native government. Although the Cabinet ratified the UNO Charter on August 14, all hopes of an Anglo-French alliance came to nothing, thanks in part to a wide-spread French conviction that Britain had driven France out of the Near East. On December 13 an Anglo-French pact provided for confirmation of Syrian and Lebanese independence and evacuation of all French and British troops. A formula of "mutual support and consultation" did not disguise the fact that the new France had suffered a major humiliation.

Meanwhile President Truman on May 18 had invited De Gaulle to visit the United States. The General, accompanied by Bidault, Chief of Staff Alphonse Pierre-Juin, and other officials, flew to Washington on August 20 and was warmly received, despite Truman's rebuke to the French press for "unfairness" toward America. The joint communiqué of August 25 bespoke "fundamental harmony" and "even closer cooperation." De Gaulle then visited New York, Chicago, and Ottawa. On August 30, after his return, it was disclosed in Paris that the Government had asked the United States for a loan of a billion dollars. On December 4 an agreement for a loan of \$550,000,000 was signed with the Export-Import Bank. Said Ambassador Bonnet: "While this loan will cover only a small part of the total requirements of France for her rehabilitation and reconstruction, it is extremely helpful at the present time and is an encouragement to France in her vigorous efforts to restore her economy."

De Gaulle at Home. The year's developments in domestic politics began with the January threat of Pierre Mendès-France, Minister of National Economy, to resign in protest against the allegedly inflationary policies of René Pleven, Minister of Finance. De Gaulle persuaded him to remain. Pleven symbolized the conservative orientation of De Gaulle himself. In his moderate program he was

opposed by the Socialists, temporarily endorsed by the Communists (so long as he made the Soviet alliance the keystone of foreign policy) and granted consistent support by the new Catholic party of the Christian Democrats or *Mouvement Republicain Populaire* (MRP) whose left wing comprised Catholic liberals and whose right wing embraced sundry clericalists, ex-Vichyites, and reactionaries. When Moscow failed to support French proposals on numerous issues, De Gaulle and Bidault (MRP) strove, also in vain, for a British alliance and a "Western Bloc." This circumstance, coupled with the disaffection of many followers, caused Maurice Thorez, Jacques Duclos, and other Communist leaders to seek a *rapprochement* with the Socialists on a program of nationalization of banks and utilities. Early in March De Gaulle refused to commit himself to such measures, though they were supported by Mendès-France, who now withdrew from the Cabinet.

On April 29, in municipal elections, the voters of France, 23,000,000 strong (with women voting for the first time), exercised their suffrage rights, in abeyance since 1937. In this and later local elections, the MRP and the Communists won notable successes. Communist proposals for a Left coalition continued to be resisted by the Socialists. In preparation for national elections the Consultative Assembly quarreled with De Gaulle over his insistence that the Cabinet should not be responsible to the proposed Constituent Assembly and that the latter should consist of two chambers and not enjoy legislative power. On July 29 the Constituent Assembly, 210-29, rejected De Gaulle's proposal for a referendum as to whether the Constitution of 1875 should be retained, amended or replaced. On August 8 the Cabinet approved a compromise under which the voters would choose a National Assembly on October 21 and also decide whether it should frame a new constitution or merely act as a Chamber of Deputies, to be complemented by a Senate under the 1875 Constitution. In the former event, it would sit for a maximum of seven months and wield limited legislative, as well as constituent, authority.

While Left demands in September for a change in the scheme of proportional representation favored by the Cabinet (based on the population of Departments according to the 1936 census) were rejected by De Gaulle, he nevertheless granted 16 additional seats to the seven most populous Departments. Cantonal elections on September 23 revealed increasing Socialist and Communist strength. The referendum ballot in its final form posed two questions: "Do you want the Assembly elected today to be a Constituent Assembly?" and "If the electorate votes 'yes' to the first question, do you agree that public authority should be exercised, until the new Constitution is completed, in accordance with the attached project of the Government?"—i.e. with the Assembly electing a new President of the Government, writing a new Constitution and sitting for seven months as a parliament with qualified power to legislate and to oust the Cabinet by majority vote. On the eve of the balloting De Gaulle reiterated his pleas for a "Yes" answer to both questions, asserted that he and the Cabinet would resign to the new Assembly, and indicated that he would refuse to resume office if the country voted "No" to either question.

The Election of October 21. On the third Sunday of October, 96 percent of the voters of France asked for a new Constitution with a resounding "Yes" to Question 1, accompanied by a somewhat smaller "Yes" to Question 2. At the same time they chose

586 members of the new Assembly. Of the 522 deputies of metropolitan France, the Communists elected 142, the MRP 140 and the Socialists 133. Moderates numbered 48, independents and miscellaneous 40 and Radical Socialists 19. Of the winning candidates 5 percent were women and two-thirds were new to political life. Workers and employees were most numerous, professors and teachers next, and lawyers third in the representation of occupations.

The result, paradoxically, was a triumph both for De Gaulle and for his severest critics. The Communist victory was as striking as the eclipse of the moderate and once powerful Radical Socialists, whose venerable leader, Edouard Herriot, had been liberated from a Nazi concentration camp by Soviet troops in April and had returned to France, via Moscow, in May. The prewar multiplicity of parties, moreover, was greatly reduced. Although 18 groups were listed in the returns, 10 had not more than six deputies each. The three major parties, each of which obtained 4,500,000 votes, had four-fifths of the deputies. The extreme Right (most of whose legislators had voted for Pétain in 1940 and were therefore ineligible) had all but disappeared. De Gaulle, warmly supported by the MRP as the new mass party of the Center, appeared to be vindicated. But the Socialists and Communists, who between them had a clear majority of the Assembly, had little sympathy with his conservatism and his liaison with the MRP.

The Assembly met on November 6. De Gaulle and the Cabinet submitted their resignations. The General, making a public appearance for the first time in civilian clothes, agreed to resume office only if the three major parties would form a coalition. On the 8th, the Assembly chose as its presiding officer Socialist Felix Gouin, chairman of the old Consultative Assembly. Despite disagreements over the composition of the Cabinet, De Gaulle was unanimously elected President of the Provisional Government on November 13.

Toward the Fourth Republic. The new epoch began with thunder on the Left. The Communists insisted upon having one of the three chief Ministries: War, Foreign Affairs, or Interior. De Gaulle refused and resigned on November 16. Thorez charged that the President, by casting aspersions on the party's patriotism, was insulting its 75,000 war dead. De Gaulle in a broadcast argued that he could not entrust to the Communists control of diplomacy, the army or the police because this would violate "the French policy of equilibrium between the two very great political Powers which I believe absolutely necessary for the interests of the country and even for peace." The Communists proposed the election of Felix Gouin as President of the Government. On the 19th, however, the Assembly, with the Communists abstaining, voted to ask De Gaulle to renew his mandate. The result was a compromise. De Gaulle himself assumed the new post of Minister of Defense, controlling the Ministries of War, Air and Navy. Four new Ministers of State were named. The Cabinet of November 21 was composed as follows:

President of the Provisional Government and Chief of the Armies—Charles de Gaulle.
 Armies—Edmond Michelet, MRP.
 Armaments—Charles Tillon, Communist.
 State—Vincent Auriol, Socialist; Francisque Gay, MRP; Louis Jacquinot, Democratic Alliance; Maurice Thorez, Communist.
 Justice—Pierre-Henri Teitgen, MRP
 Interior—Adrien Tixier, Socialist
 Foreign Affairs—Georges Bidault, MRP
 National Economy—François Billoux, Communist.
 Finance—René Pleven, Republican Socialist.

Industrial Production—Marcel Paul, Communist.
 Agriculture and Supplies—Pierre Tanguy-Prigent, Socialist
 Public Works and Transports—Jules Moch, Socialist
 Labor—Ambrose Croizat, Communist.
 National Education—Paul Giacobbi, Radical Socialist.
 Colonies—Jacques Soustelle, Democratic Socialist Union of Resistance.
 Post and Telegraphs—Eugene Thomas, Socialist.
 Population—Robert Prigent, MRP
 Reconstruction—Raoul Dautry, non-party technician
 Information—André Malraux, independent.

"Citizen de Gaulle" (as Socialist André Philip called him) now endorsed plans for nationalization of credit and electric power. On November 23 the Assembly gave his Cabinet a unanimous vote of confidence. On December 2, by a vote of 521 to 35 the deputies passed bills nationalizing the Bank of France, the *Crédit Lyonnais*, the *Société Générale*, the *Comptoir National des Comptes* and the *Banque Nationale*, with stockholders receiving government bonds in place of their shares in the bank, which were put under the direction of a National Council of Credit. Work also began in December on a new Constitution. But De Gaulle's concessions to the Left failed to satisfy his critics. At year's end a new crisis developed over the President's proposal for defense credits of 125 billion francs in a total budget of 487 billions. When the Socialists demanded a 20 percent reduction in proposed military expenditures, De Gaulle again resigned while his opponents denounced him for making the issue one of confidence. In a 36-hour session, with the clock turned back to midnight of December 31, the Assembly evolved a compromise by which a 5 percent cut was approved, to be enlarged to 20 percent if the Government by February 15 had not introduced its plan for army reorganization.

New frictions followed over the food crisis and the issue of executive powers in the new Constitution. On January 20, 1946, De Gaulle resigned for the third time in nine weeks—now "finally," and in protest against Leftist demands for smaller military appropriations and an omnipotent parliament. Whether a stable Socialist-Communist bloc or a viable Socialist-MRP coalition would emerge to draft the Constitution and inaugurate the new regime was uncertain in the immediate aftermath of De Gaulle's exit. Meanwhile the coalition carried on and elected Felix Gouin to the Presidency.

Watch on the Rhine. In France, as elsewhere, politicians and patriots were preoccupied with the quest for military security. And in France, as elsewhere, few realized that in the atomic age security could no longer be had through armies, navies, strategic frontiers and efforts to weaken potential foes. French eyes remained fixed on the Rhine frontier and the traditional enemy beyond it. Early in the year De Gaulle expressed lack of confidence in any international regime in the Rhineland. Paris demanded French control of the Saar, the creation of an "independent" Rhineland under French protection, and the separation of an internationalized Ruhr from any reconstituted Reich.

This conception received little support in London, Moscow or Washington. French power alone was incapable of realizing it. Late in April, French occupation of Stuttgart provoked a request from SHAEF for evacuation of the city on the ground that it was needed as HQ of the U.S. Seventh Army. By the terms of a compromise, French troops were permitted to remain. The arrangements outlined at Yalta and confirmed at Potsdam for French participation in the occupation and administration of the broken Reich were received in Paris with qualified enthusiasm. In September a French memorandum to the London Council of Foreign Min-

isters asked for delay in setting up a unified German regime and for the exclusion of the Rhineland and the Ruhr from the control of any German authority in Berlin. On September 22, De Gaulle appealed for internationalization of the Ruhr and permanent French occupation of the Rhine.

Having discovered no evidence of foreign support for such a program, the Quai D'Orsay instructed the French representative on the Allied Control Council in Berlin to abstain from voting on all projects for a unified German administration, contending that France had not been a party to the Potsdam accords proposing such a development. Since unanimity was required, this decision prevented action. In mid-November Paris vetoed the desire of Washington, London, and Moscow to permit German trade unions to amalgamate on a national scale, since such a step would imply that the Ruhr and the Rhineland were properly part of "Germany." On November 21 Byrnes urged Maurice Couvé de Murville, director of the Quai D'Orsay who had come to Washington to plead for Rhenish "independence," to ask his Government to end the Berlin deadlock. Paris indicated that it would do so if the Big Three would agree to a "provisional line of demarcation" in western Germany beyond which the authority of the proposed central agencies would not extend. Eisenhower publicly reproved the French Government for blocking the economic and administrative unification of the Reich. The stalemate remained unbroken at the end of the year.

Diplomatic Dilemma: "Grandeur" and Impotence. De Gaulle's incessant quest for national "greatness" was foredoomed by French weakness in a world inevitably dominated by America, Britain, and Russia. His hopes of enhancing French bargaining power by playing off the Atlantic giants against the USSR were frustrated by the fact that an enfeebled France had nothing to offer to either. Moscow resented French projects of a "Western bloc" as well as the ill-concealed antipathy of French conservatives toward the Soviet Union. Washington was irritated by French "obstructionism." London capitalized upon French helplessness.

The weakness of the French position was demonstrated anew during the London and Moscow Conferences of Foreign Ministers. At the September meeting Bidault contributed to failure by siding with Bevin, Byrnes, and Wang against Molotov on all controversial Balkan questions, not out of concern for French interests in the Balkans and still less on principle but only because Paris was wholly dependent upon British and Chinese aid in Indo-China, where native rebels threatened an end of French control. France restored the lease-hold of Kwangchowan to China by an accord of August 18, but aroused Chinese resentment by refusing to follow the example of other Powers in giving up extraterritorial privileges. French exclusion from the Moscow Conference provoked irritation in Paris and requests for explanations and reassurances.

The new France could not hope to play a Great Power role anywhere in the world unless Russia and the Anglo-American bloc should become rivals for global hegemony. Yet discord among the Big Three threatened ultimate consequences which would be as disastrous to France as to all other nations. Between these grim alternatives, French diplomacy found no middle course in 1945. A possible solution was suggested in vigorous French championship of the liberal tradition. On May 25 the Foreign Affairs Committee of the Consultative

Assembly proposed that the Allies jointly demand the resignation of Dictator Franco. In June Paris made apologies to Madrid over the action of a mob in Chambery in attacking a train full of Spanish nationals returning from Germany. The violence was provoked by reports that the train contained members of the Spanish Blue Division which had fought beside the Nazis in the invasion of Russia. In December the French Government proposed consultations among Paris, Washington, and London looking toward severance of diplomatic relations with Franco and other forms of pressure to bring about the overthrow of Spanish Fascism.

Whether such initiatives would produce results and, if so, whether they would constitute a new basis of French foreign policy was doubtful. When the powerless strive for power, the result is frustration—as the Left parties tacitly recognized at the turn of the year in their opposition to De Gaulle's plans for extensive rearmament. The new France might find the road to a new freedom by creating a new polity, a new economy, and a new society within the frontiers of the Republic, and by promoting the unity of the Super-Powers and the success of the U.N.O. It could never find glory by petulance, obstructionism, and hopes for a rift among the new masters of the world.

FREDERICK L. SCHUMAN.

FRANKLIN INSTITUTE. The Franklin Institute of the State of Pennsylvania for the Promotion of the Mechanic Arts, founded in 1824, is devoted to the increase of useful knowledge, to the encouragement of invention and discovery, and to the education of the public in the achievements of science and industry. Its very title has always indicated a desire to do honor to Benjamin Franklin.

The Franklin Institute includes in its activities: publication of *The Journal of The Franklin Institute*, established 1862; lectures presented about twenty times a year by distinguished persons in science and industry; the Bartol Research Foundation which is devoted to research in pure science; the Biochemical Research Foundation devoted to the study of diseases from the chemical viewpoint; the technological Library which now numbers 126,000 volumes and 40,000 pamphlets devoted to works of applied science and technology. The Library also contains a collection of patent literature. The two laboratories, the machine shops, and the staff of the Institute all worked to the fullest extent in the war program.

Another important activity is the Committee on Science and the Arts, formed of 66 members of the Institute, which reviews in great detail many of the advances of science and technology. It recommends to the Board of Managers those persons deserving the annual awards of the Institute, which are formally presented at Medal Day exercises in the spring. A Franklin Medal, highest award of the Institute, was presented in 1945 to Harlow Shapley, Director, Harvard College Observatory, Harvard University, Cambridge, Massachusetts, in consideration of his many valuable contributions to the science of astronomy, and especially of his work in the measurement of the vast distances necessary for the determination of the nature and extent of our galaxy, as well as those of other galaxies external to ours.

The Institute also maintains in its new building, erected in 1933 as a national memorial to Benjamin Franklin, a scientific and technological Museum containing thousands of active exhibits, the Fels Planetarium, an Observatory open to the public, and a Seismograph. To make Franklin better known and emulated, the National Franklin Committee was formed in 1941. Through its efforts information concerning all phases of Franklin's life is distributed free of charge.

The Franklin Institute membership now numbers about 5,500. The President, reelected in 1943, is Charles S. Redding; Secretary and Director, Henry Butler Allen. The Franklin Institute is located on the Benjamin Franklin Parkway, Philadelphia 3, Pa.

FRENCH EQUATORIAL AFRICA. A French colonial territory in north central Africa consisting of four colonies: Chad (461,202 sq. mi.), Gabon (92,218 sq. mi.), Middle Congo (166,069 sq. mi.) and Ubangi-Shari (238,767 sq. mi.), making a total of 959,256 sq. mi. Though administratively separate, the French mandated area in the Cameroon is included under this heading, with 166,489 sq. mi.

Government. French Equatorial Africa is administered as a unit by a Governor-General whose seat is at Brazzaville and who makes up a budget for the whole area. He is assisted by an administrative council. Each of the four colonies has a Governor to supervise local affairs. There are no really representative institutions, though the Free French régime—to which the Negro Governor Félix Eboué declared the region's loyalty in 1940—enunciated policies looking toward the closer association of the native peoples with the rest of the empire. During the war Equatorial Africa played an important part by providing overland access to the Nile Valley and Middle East and by forming a territorial base for the de Gaulle regime at a time when France and most of her empire was in Axis or Vichy hands. A powerful radio station was constructed at Brazzaville in 1942 for broadcasting in various languages to many parts of the world. In 1944 the budget was reported to be balanced at 600,000,000 francs.

Events, 1945. Ever since the invasion of French North Africa and the surrender of Vichy forces in French West Africa, the Equatorial colonies had been less important both strategically and politically. Nevertheless, the Provisional Government of General de Gaulle made it plain that the African territories would not be neglected as they had been before the war. Plans were also made to have the colonies represented in the National Assembly called to draw up a new constitution not only for France but the new French "federal union" comprising the overseas empire.

Labor troubles were reported from Duala in the Cameroon during the fall. On Sept. 21 a strike of railway workers there led to a call for troops, followed by bloodshed in which eight natives were killed and twenty wounded. Four days later, a labor union leader shot the secretary of the local chamber of commerce.

Characteristics of the Population. In 1943 the population of French Equatorial Africa was calculated at 3,524,710, of whom 6,100 were Europeans, or .2 of one percent. In the Cameroon there were 2,500,000 natives and about 3,000 Europeans. Compared with Nigeria or the Belgian Congo these figures represent low densities. In the south and center there dwell Bantu Negroes, while in the north the natives are Sudan Negroes with strong Hamitic and some Arab intermixture. Those in the

latter (and drier) region are largely Moslems; the Bantu in the wetter areas are pagans—except those few who have been converted to Christianity.

In general native institutions have been less disrupted than in the Belgian Congo or in West Africa. Educational opportunities are provided largely by missionary societies.

The Country and Its Economy. Along the coast are vast forest tracts, as well as bordering the rivers in the interior. In the northern part lies the Sudan with its open savannas, which shade off into steppe and desertic country as one proceeds northward into the Sahara.

The occupations of the inhabitants depend largely on these climatic conditions: tropical agriculture in the south and center, and more pastoral pursuits in the drier Sudan. The resources of French Equatorial Africa are very largely undeveloped. In the Cameroon there are a number of plantations, started by the Germans. For many years the French tried the system of granting large concessions to capitalist concerns, much after the fashion of Leopold II in the Congo. In recent years this system has been in less favor, because it failed to provide for an orderly and sound economic development or to safeguard the welfare of the natives. In the Cameroon the French Government is bound to observe the terms of the Mandate (Class B) concerning monopolies, tariffs, native rights and so forth. During the war rubber production in the Cameroon was increased from 773 tons in 1939 to 3,000 tons in 1944. Other important exports from this territory are: peanuts, palm oil, hides, timber, cacao and coffee. From French Equatorial Africa come much the same products. Large numbers of cattle, sheep, goats, horses and camels are raised in the north, but are not exported for lack of a ready market. The colonies' mineral resources are believed to be valuable but have only begun to be exploited.

The value of exports from Equatorial Africa in 1942 was 469,314,000 francs, and of imports 778,358,000 francs. The relevant figures for the Cameroon in 1938 were 251,959,000 francs and 215,212,000 francs. The principal ports are Duala (Cameroon), Port Gentil, Libreville and Pointe Noire. The latter is connected with Brazzaville on the Congo by a railway (318 miles). There are 319 miles of railway in the Cameroon. In both the mandated territory and in Equatorial Africa there are several thousand miles of road, of which only a part is suitable for heavy, all-year traffic. New road links were built during the recent war to speed goods to the Middle East and Ethiopian fronts.

ROBERT GALE WOOLBERT.

FRENCH GUIANA. A French territory in northern South America, comprising the colony of French Guiana (7,720 sq. mi.; pop. 31,000) and the hinterland territory of Inini (27,020 sq. mi.; pop. 6,100). In 1944 the penal settlement contained 2,240 men. Chief towns: Cayenne, capital, 13,936 inhabitants, Mana, Oyapock, St. Laurent, Sinnamary. Chief crops: rice, maize, manioc, cacao, coffee, bananas, and sugar cane. There are large forests rich in various kinds of timber. Gold mining is the chief industry. Silver, copper, iron, lead, mercury, and phosphates are found. Foreign trade (1940): imports 64,154,188 francs; exports 44,502,181 francs (franc averaged \$0.0208, 1940). The budget (1944) was balanced at 42,510,110 francs. For the territory of Inini the budget (1944) was balanced at 4,323,900 francs. Shipping (1940): 878 vessels entered and cleared. Administration is controlled by a Governor, assisted by a privy council

of 7 members. There is a Council General of 8 elected members elected by French citizens living in the colony. The territory of Inini is under the direct administration of the governor of French Guiana, assisted by an administrative council of 4 members acting in an advisory capacity. Governor, Jean Rapenne (appointed March, 1943).

FRENCH INDIA. The five French colonies in India—Chandernagor, Karikal, Mahé, Pondichéry, and Yanam. Area, 196 square miles. Population (1941), 323,295. Capital, Pondichéry, 53,101 inhabitants. Education (1942): 67 primary schools and 4 colleges, and 13,319 students. The chief crops are rice, manioc, and groundnuts. Livestock (1942): 35,563 cattle, 23,024 sheep, 17,700 goats. There are cotton and jute mills at Pondichéry and Chandernagor. Trade, at the ports of Pondichéry and Karikal (1942): imports 35,749,000 francs; exports 17,850,000 francs. Shipping (1942): 86 vessels entered and cleared. There were 43 miles of railway open to traffic. Budget (1943): 3,274,850 francs. The colonies are divided into 5 dependencies and 17 communes, having municipal governments. There is an elective general council. Governor, Louis Bonvin.

FRENCH INDOCHINA. A dependency of France, in southeastern Asia, comprising the divisions shown in the accompanying table. On July 30, 1941, the Vichy French regime signed a pact with Japan by which Japanese troops were allowed to occupy certain points in French Indochina. On Mar. 10, 1945, the Japanese seized complete control of the country but after V-E Day, September, 1945, following the defeat of Japan, French officials resumed the administration of French Indochina.

<i>Divisions</i>	<i>Sq. mi.</i>	<i>Pop. (1936)</i>	<i>Capital</i>
Annam *.....	57,143	5,656,000	Huê
Cambodia *.....	69,884	3,046,000	Pnom-Penh
Cochinchina *.....	25,096	4,616,000	Saigon †
Laos *.....	89,189	1,012,000	Vientiane
Tonkin (Tongking) *..	44,784	8,700,000	Hanoi †
French Indochina *....	286,096	23,030,000	Hanoi †

* Protectorate. † Colony. ‡ Exclusive of the leased territory of Kwangchowan (309 sq. mi.; pop. 230,000 in 1936) which was returned to China by the French on Aug. 18, 1945. † The capital city is Hanoi but during certain seasons of the year, when climatic conditions are oppressive, the government offices move to Saigon.

Chief towns (with 1940 population for Hanoi; 1936 figures for the rest): Hanoi (capital) 134,849, Binh-Dinh 147,199, Cholon 145,254, Haiphong 122,000, Saigon 110,577, Pnom-Penh 102,678, Huê 33,222.

Production. The chief agricultural products are rice, maize, pepper, spices, tea, kapok, groundnuts, copra, and rubber. The forests in the north produce tropical hardwoods, bamboo, herbs, and essential oils. Fishing is an important native occupation. Included in the minerals produced are anthracite, gold, chromite, manganese, tungsten, antimony, tin, zinc, and iron.

Foreign Trade. In 1942, imports were valued at 1,378,000,000 francs; exports 2,471,000,000 francs. Imports included cotton and silk tissues, metal goods, and motor vehicles. Chief exports: rice, rubber, fish, coal, pepper, cattle, hides, corn, zinc, and tin ore.

Finance. There is a common budget for the whole of French Indochina and a separate budget for each of the states. General budget (1941): 1,290,147,500 francs; extraordinary budget (1941): 189,337,800 francs. On Jan. 1, 1941, the outstanding debt of French Indochina totaled 2,515,894,110

francs, including government loans and loans for the purchase of railway material.

Government. Under French rule the administration of the whole of French Indochina was headed by a Governor General and he was assisted by a Secretary General, a government council, and a grand council for economic affairs. Each of the four protectorates (Annam, Cambodia, Laos, and Tonkin) was headed by a Resident Superior and he was aided by a protectorate council and a council of economic affairs. The colony of Cochinchina had a Governor at its head and he was assisted by a colonial council. Governor General: Adm. Thierry d'Argenlieu (appointed September, 1945).

Events, 1945. French Indochina, which has a territorial area somewhat larger than the state of Texas, is of great strategic importance due to its location at the base of the large Malay peninsula which juts out from the southeastern coast of the Asiatic Continent. From the standpoint of its location, French Indochina resembles the state of Florida on the North American Continent.

Aside from an extensive coastline on the South China Sea, Indochina has a long contiguous border with China's southern provinces of Kwangtung and Yunnan, and with Siam (Thailand) and British Burma. The only railway extending into China's important province of Yunnan is French-owned and extends from the French port of Haiphong on the Gulf of Tonkin, across northern Indochina, to Kunming. The Japanese seized the section of the railway running through French territory shortly after Pearl Harbor and confiscated large stocks of American goods stored at Haiphong or en route to Chinese territory.

The frequent mention of French Indochina in connection with the outbreak of the war in the Pacific in 1941, and the U.S. Congressional investigations concerning the Pearl Harbor incident in 1945 emphasized the important position of the French Colony in the oriental war situation. International interest in the Colony has continued due to the struggle of the natives for independence from French rule.

Gen. Georges Catroux's Explanation. Gen. Georges Catroux, who occupied the position of Governor-General of Indochina in 1940, made some interesting disclosures concerning Japanese pressure, American and British policy, and French diplomatic policy in Indochina in the months preceding the war. Gen. Catroux's statement was issued from Moscow on August 1, 1945, where he was serving as Ambassador to Russia. His statement, which occupied more than two columns in the New York papers (Associated Press report), constituted a denial of charges made at the trial of Marshal Henri-Philippe Pétain in Paris that Pétain had removed Catroux "because he favored the Japanese demands concerning the occupation of the province." Catroux claimed that he attempted to save Indochina by a policy of "negotiating and stalling."

The following is a brief summary of his points: "The commander of the Japanese Army in Kweichow Province of China (directly north of Indochina) was constantly threatening and criticizing Indochina for 'assisting' China by permitting the transport of materials across Indochina into Chinese territory. The Japanese Army radio constantly broadcast these protests and demands—the Japanese were particularly angry regarding the transport of gasoline to Kunming under the Chinese-American barter agreement. As a result, I, of my own accord, stopped the transit of gasoline on June 16, 1940.

"As I was very anxious to know the attitude of the United States if the Japanese attacked Indochina, I asked the French Ambassador in Washington on June 18, to take up the matter with the State Department. On the following day I asked the French Ambassador in Washington to request the State Department for permission to ship 120 aircraft and aircraft-guns to Indochina for the purpose of 'maintaining the status quo in the Pacific.'

"On June 19 I received, through the French Embassy in Tokyo, a Japanese ultimatum to immediately stop all transit of goods to China over the French railroad. The French Ambassador in Tokyo declared that acceptance alone could prevent aggression and represented the last chance to save Indochina.

"On June 20 the French Ambassador in Washington transmitted to me the reply of the Under-Secretary of State: 'the United States Government did not believe that it could enter into conflict with Japan and that furthermore it would take no action if Japan attacked Indochina.'

"The French Ambassador in Washington observed that in the circumstances, the only course open was to close the Chinese frontier. To this the Under-Secretary of State remarked, 'I will not answer you officially but that is what I would do in your place.'

"With reference to the request for a permit to purchase arms in the United States the Under-Secretary said the application 'would be welcomed like that of any other friendly Government.' Nothing came of the request, however."

Gen. Catroux then explained that his appeal for assistance from the British "was no more encouraging." He explained that he had to depend on his own resources because the Japanese army in South China was superior to the French force in Indochina; that the Japanese had 200 aircraft against only twenty-five modern machines. In addition Indochina had no naval force and only sufficient munitions for a month's campaign. It would have to face a combined land and sea attack, the outcome of which would be Japanese occupation and the French loss of sovereignty.

Gen. Catroux accepted the Japanese demands and on June 29 a Japanese transit control commission, under General Nishihara, arrived and established itself on the border between French Indochina and Chinese territory. Gen. Catroux then said, "From then on my policy was to temporize and hold on, waiting for a more favorable turn to the war. My action then accorded with the policy of Great Britain, which had also yielded to Japanese demands and closed the Burma Road to Chinese transit . . . I sent a purchasing mission to Washington. I gave the Japanese Army no pretext for intervention, insisted on mutual respect for the transit agreement, and refused encroachment on the sovereign rights of France.

"In order to divert Japanese attention from their territorial aims, I pressed them toward economic understandings that could be advantageous to both countries. However, I concluded no agreements and always stipulated that Japan must respect our sovereign rights. The only agreement made provided for a mixed airline run by aircraft of both countries over the Canton-Hanoi route. I refused Japanese demands on two important points:

(1) I refused on July 2, 1940 a demand by the Japanese General Staff to appropriate 5,900 tons of wolfram and 6,000 tons of antimony held in bond in Tonkin by China on behalf of the United States.

(2) I turned down an offer by the Japanese General Nishihara for a defensive alliance, and, contrary to report I did not recommend such an alliance to the Pétain Government in France.

"I vainly tried to make my position and actions understood by the Pétain Government. But I was repudiated and by this act was destroyed the fragile equilibrium that I had built up. . . . But this is another story." General Catroux concluded by declaring he had documentary proof to substantiate his actions, which he regarded as justified in view of the lack of allied aid.

State Department Corroboration. The State Department said, following perusal of Catroux's statement, that in the period before America's entry into the war it had never informed another country it would take armed action against an aggressor. This was true when Indochina was penetrated by Japan in 1940, and had been true when Germany invaded Poland, as also when Japan invaded Manchuria in 1931. However, the United States had made "vigorous representations" to Japan against her policy in Indochina in 1940 and the record had been published.

New Charter for Indochina. In an effort to improve the relations between France and the natives of Indochina the French Cabinet on March 23 approved a new charter for the colony which provided "virtual economic autonomy and democratic reforms in the political and economic set-up," according to the report from Paris. The Charter referred to the "Federal Union of France," implying replacement of the present colonial system by a federation of semi-independent states united under the French flag.

The Charter was designed to go into effect as soon as possible after Indochina was liberated from the Japanese. Under the new Charter the five separate parts of the colony—Tonkin, Cochinchina, Cambodia, the territory of Laos and Annam—would be governed by an over-all, democratically elected assembly, over which a Governor-General would preside. Indochina itself would be represented in the body of the future federated union. In general the proposed charter guaranteed that Indochinese as well as the French would have the opportunity to vote and hold government posts of all kinds, including those of ministers.

In a statement accompanying the announcement of the new "French Union," Gen. Charles de Gaulle said that the basis of all future laws in Indochina "should be liberty of thought, liberty of creed, liberty of press, liberty of assembly and all other democratic liberties." He said that all citizens of the French Union qualified to hold office would be eligible for all ranks in an Indochinese Army and Navy and air force to be created in future.

Final decision on the formation of the "French Union" would have to await the constituent assembly which will write the new French Constitution. Tentatively, however, it was thought that each colony or protectorate would be given a status commensurate with its development. Thus, in Indochina it was thought that there may be three, four or five colonies or protectorates sufficiently advanced to have elected assemblies. They would be represented in the "Assembly of the Indochinese Federation" which would send representatives to Paris. The Indochinese Assembly would control its own budget, economic and internal affairs, but decisions on foreign affairs and national defense would be left to France.

According to a report from Paris in the New York *Herald-Tribune* it was thought that the French Government was trying to "anticipate the

unwelcome idea of an international trusteeship of colonies" which it was thought would be submitted to the San Francisco Security Conference. Attention was called to the fact that the "French Union" would differ materially from the British Commonwealth, because the peoples of the component parts of the British Commonwealth are more highly developed.

Japanese Move Against French. A report by the German Transocean News Agency from Tokyo in mid-March stated that the Japanese Government had asked Henri Cosme, representative of Vichy France, "to discontinue his official activities." In addition the Japanese disarmed some 2,000 French troops at Shanghai. Also, the Japanese officially renounced a 61-year-old treaty with France concerning Annam, the Japanese purpose being to gain control of that 59,000 square mile section of Indochina. A Tokyo message said that King Baodai of Annam had declared his independence of France and in future would support the Japanese "Co-Prosperity Sphere."

On March 13, the Berlin radio announced that Cambodia, another important province, had declared its independence of France and also had joined the Japanese. Cambodia occupies the southwestern part of Indochina. An official report from Paris admitted that French garrisons in South Cochinchina and Annam, outnumbered 10 to 1, had surrendered to the Japanese. It was announced that the border between Indochina and Thailand had been closed. Paris claimed that French troops in northern Tonkin were resisting the Japanese, "in accordance with orders from Paris."

On March 10, the Japanese military in Tonkin took Vice Admiral Jean Decoux, the French Governor General of Indochina into "protective custody." The Japanese commander accused the French official of "insincerity" and secret activities designed to join hands with the Allies. The Japanese action in taking over control of all Indochina was made following the alleged refusal of the French authorities to cooperate with Japan in measures for the "joint defense" of the country. The Japanese announced on March 13 that they had overcome all French resistance along the northern coast, and that further high French officials had been taken into custody.

They stated also that a considerable section of Northern Indochina, the Kwangchow, an area south of Canton, and sections along the Gulf of Tonkin, would be "restored" to China.

Among the Japanese "charges" against the French administration were that American submarines were using secret bases on the Indochina coast; that the 14th Air Force had a landing field at Taigin, forty miles north of Hanoi; that there was secret cooperation with U.S. air forces in China, Philippines and India; that American aviators had dropped supplies to French and guerrilla forces "many times."

A French officer who escaped from Indochina reported that the Japanese had 100,000 troops concentrated at key points, with some 30,000 near Saigon, the capital.

U.S. to Supply Arms. It was announced in Washington on March 12 that the French had requested ships to transport an army from North Africa to Burma, but Washington was not favorable to the project. The French stated they had approximately 30,000 French and native troops in Indochina. Washington regarded Indochina as located within the war theater of Admiral Lord Louis Mountbatten. It was announced in Paris on March 22 that the United States had agreed to

supply arms and other war materials to French and native forces which were resisting the Japanese. It was thought the arms would be delivered by air-borne units of the U.S. 14th Air Force already operating in that sector. The 14th Air Force reported on March 21 that it had strafed the Japanese in the Black River area west of Hanoi where French guerrillas were fighting the Japanese.

Adm. Chester W. Nimitz reported that U. S. carrier aircraft of the Pacific Fleet had attacked Japanese naval contingents off the coast of Indochina. It was thought the U.S. Forces had intercepted Japanese naval convoys operating between Saigon and Singapore. The point of the attack was between Saigon and Cam-Ranh Bay, the last mentioned being the best naval base on the south-east Asiatic coast, rated as one of the world's best harbors.

It was reported late in March that the Japanese had seized Kwangchowan, the French base on the China coast south of Canton and north of Hainan Island.

China Invades Indochina. The military forces of China entered the Indochina picture late in July by invading the French colony along the border 93 miles north of Hanoi. The Chinese forces were led by Gen. Chang Fa-kwei, well-known Cantonese commander. The Chinese had pushed the Japanese back along an 185-mile front and had severed the Japanese land communications from Kwangtung Province of South China to northern Indochina. The Chinese forces cut a 120-mile gap in Japan's "land-bridge" to southeastern Asia.

The entrance of Chinese forces into northern Indochina raised political issues between China and France, according to reports from Paris late in September. On Sept. 15 Paris charged that the Chinese forces had refused entrance to their zone of the French General Marcel Alessandri. The French also charged that the Chinese were assisted by an American General Gallagher who was serving in an advisory capacity with the Chinese forces. The Chinese Premier T. V. Soong visited Gen. Charles de Gaulle on Sept. 19 in Paris and discussed Sino-French relations in Southwest China and in Indochina. According to telegrams from Paris Premier Soong informed de Gaulle that the Chinese intended to police northern Indochina until conditions became stabilized in that area. It also was reported that the Chinese had demanded control of the Yunnan Railway connecting Kunming with the sea at Haiphong. The Chinese stated they were cooperating with British forces which had been landed at Haiphong. The commander of the Chinese forces in Indochina was General Lu Han.

An Associated Press report from Hanoi on Sept. 28 explained the complications which had developed between the Chinese commander, Gen. Lu Han and the French commander Gen. Marcel Alessandri. The French commander refused to participate in the Japanese surrender ceremonies because the French flag was missing from the decorations of the main administration building from which France formerly ruled the colony. The Chinese explained that under the Allied agreement only the flags of the four major powers of the Potsdam Conference could be used. Paris announced on Sept. 29 that another commander of higher rank was being sent to Hanoi, Gen. Jacques Leclerc, who would take charge of French forces.

Growing Native Unrest. Lt. Gen. Sir William J. Slim, Commander of the British Fourteenth Army at Saigon, reported on Sept. 17 that the situation between released Frenchmen and native Annamese

was becoming "tense," and trouble was likely in the event of a "challenge" from either side. The British commander declared that the object of the British forces was threefold: (1) To disarm the Japanese; (2) evacuate war prisoners; (3) maintain order.

According to reports from Chungking French anxiety was due to the increasing activities of two native political parties which were agitating for complete independence of Indochina from French rule. The parties were the Viet Nam and the Viet Minh. It was claimed that the independence parties had their headquarters in Annam where the Chinese forces were quartered. It also was charged that the Japanese troops had turned over stocks of munitions to the nationalist parties.

According to a report from Paris in the New York *Herald-Tribune* the Chinese Empire was forced by France to surrender its sovereignty over Indochina in 1885. However, France was now willing to grant China railway and port facilities in the northern part of Indochina in order to give Southwestern China access to world trade.

A report from Chungking on Sept. 19 stated that China had given permission to the French to move 5,000 French troops from Yunnan province into Indochina. The French force had entered Yunnan when the Japanese invaded Northern Indochina. K. C. Wu, Chinese Minister of Information, stated that Chinese troops in Indochina had no other purpose than to assist in the disarming of the Japanese in accordance with the decisions of the Allied Chiefs of Staff. He said the Chinese had charge of all territory north of the 16th parallel which bisects Indochina. Wu said the Chinese had complied with three French requests: (1) That a French general participate in the Japanese surrender; (2) that 5,000 French troops which retreated into China be permitted to re-enter French territory; (3) that the French be permitted to use airplanes which had been flown into Chinese territory.

"Independence or Death." The Nationalist Party of Indochina, the Viet Nam, which received the "control" of the country from the Japanese in March, issued a proclamation on Sept. 7 declaring that Indochina was "free and independent of the French." Hanoi, the capital, was plastered with slogans reading, "Independence or Death." The other party, the Viet Minh, or the Communists, up to the present had cooperated with the Viet Nam. Armed guards of the two groups patrolled the city where some 25,000 French awaited liberation and where many armed Japanese were still at large. The head of the newly-formed national government, Ho Chin Minh, who has the title of "premier," declared that the native peoples intend to keep their independence at all costs. He said the French had labeled him a "communist and a bandit." Hanoi in September was facing famine and Premier Ho Chin Minh was trying to find boats to bring in surplus rice from Saigon. That the natives had some support in France was indicated in a declaration in Paris of Prof. Tran Duc-Thad, who claimed to head some 25,000 Indochinese laborers in France. He denounced the action of the French Government in dispatching large forces to Indochina under General Leclerc, and Admiral d'Argenlieu, and declared they would be resisted on arrival at their destination. He charged that Indochina's old culture had been destroyed; that the country was now 89 per cent illiterate, and that native industry had been suppressed in order to safeguard French markets. Another native leader, President Pham Von Bach

of the Southern Annamite provisional government, charged that the French had oppressed Annamite leaders who tried to organize resistance to the Japanese invasion; that the French had collaborated with the Japanese in trade at the expense and welfare of the people; that the French had failed to offer more than "token" resistance to the Japanese despite the presence of a large body of well armed French troops.

Dr. Sun Fo, President of the Chinese Legislative Yuan, urged that Indochina be placed under a protectorate of the United Nations. He foresaw "perpetual" internal strife if the French attempted to regain power. Sun Fo charged that Indochina was the "worst run" foreign governed colony in the Far East.

American Officer Killed. On Sept. 28 the senior American officer in Saigon, Lt. Col. A. Peter Dewey of Washington, D. C., was shot and killed in an outbreak of fighting in the northern outskirts of Saigon. Col. Dewey was connected with the U. S. Office of Strategic Services (OSS). Another OSS officer, Capt. Joseph Coolidge of Boston, was severely wounded. The American officers and some newspaper correspondents were besieged for several hours before the British were able to send a contingent of Indian Gurkhas to relieve them. The Americans were attacked by Annamese troops despite the fact the American headquarters was plainly marked with an American flag.

A contingent of air-borne American troops was landed at Hanoi on Sept. 16 for the purpose of assisting the evacuation of some 150 American war prisoners and allied civilian internees.

Col. Stephen L. Nordlinger, American officer who participated in the release of some 5,000 Allied prisoners of war in Indochina, stated in the course of an interview on Dec. 26 that the native independence movement was gaining in momentum. Col. Nordlinger spent two years in Indochina and became acquainted with the French and native leaders. He said that the native leader, Ho Chin Minh, and the French High Commissioner, Roger Sainteny, had held many conferences in an attempt to reach a peaceful compromise. He said that the native leader Ho probably would accept "Dominion status," if some method could be worked out whereby it could be guaranteed by the United Nations Organization. The French disagreed with the proposal.

Reports from Saigon in late September stated there was serious fighting between the French and Annamites and that the Annamites had declared a boycott against all French. Fighting started when some 1,500 French troops, who had been interned with 3,500 other Europeans, had escaped to China and then returned and made a surprise attack on the Annamites. The British Commander, Maj. Gen. Douglas O. Gracey, issued an order in the name of Admiral Lord Louis Mountbatten requiring the Viet Nam to suspend all newspapers; cease requisitioning buildings, and all Annamese police and armed forces to remain in barracks.

Anglo-French Pact. An Anglo-French pact concerning Indochina was signed in London on Oct. 10. The pact was signed by British Foreign Secretary Ernest Bevin and the French Ambassador René Massigli. It gave full recognition of French rights in Indochina and within the British Zone (south of the 16th parallel) the French civil administration will control and the British occupation shall only be "temporary."

The French announced the arrest of Prof. Tran Duc-Tad, leader of the Indochinese mission in France. The Indochina Communist Party on Oct.

10 denounced the British for "upholding the imperialist policy of France."

The French Second Armored Division together with naval forces from the French battleship Richelieu were landed near Saigon on Oct. 30. The landing of additional French contingents at Saigon had enabled the British to withdraw some of their forces from Indochina to the Netherlands Indies where they were greatly needed. The French forces were transported to Saigon in American ships.

A report from Chungking at the end of the year expressed fear that there would be serious trouble in Northern Indochina when the Chinese forces withdrew their troops due to the fact that the Chinese were in sympathy with the Indochinese Nationalists.

JOHN B. POWELL.

FRENCH LITERATURE. The year 1945 has been marked in France by a literary boom. Newly recovered freedom of expression tempted many writers who had been forced into silence or clandestine literature; political and social questions were again hotly debated; many new talents came to the fore, encouraged by the impatience of the public to break with the past and to hail a new era. Paper continued to be scarce, and books, printed in relatively small but high-priced editions, were quickly sold out. But the number of new works thus published was high, and several new reviews appeared while others, announced and apparently ready, are still awaiting paper allotment to come out. A few publishing houses which had been notoriously collaborationist have been placed under the direction of official administrators; new firms, often headed by former Resistance writers (Vercors, Seghers, editions of *Fontaine*, of *Confluences*) have been opened. The price of books is very high, reflecting inflationary conditions and the avidity of the French to invest their paper money into all that can be bought as well as their interest in thought and in art and their desire to escape from harassing material difficulties into the world of fiction and poetry.

Personalia and Literary Events. The *épuration* of the literary world has been conducted with laudable restraint, although with regrettable delay and some occasional inequality in the treatment meted out by different courts of justice. Two writers of some fame, Paul Chack and Robert Brasillach were sentenced to death; Maurras, probably more guilty than they, to life-imprisonment. Others, like Montherlant, who had compromised themselves more warily, are left free, though despised by the larger part of the reading public. André Malraux and André Chamson, two heroes of the Maquis, came back to civilian and literary life after the defeat of Germany freed them from their military posts. The outstanding deaths were those of Romain Rolland (on Dec. 30, 1944) and of Paul Valéry (on July 20, 1945). The former had just completed an important two volume work on Péguy which, unlike several recent books on that writer, remained this side of idolatry; the latter was celebrated universally as one of the official literary figures of France. His prestige and influence spread among thousands who could hardly understand his poetry. He had just published extracts from his *Troisième Faust* and an address on Voltaire. The 250th anniversary of Voltaire's birth had been celebrated in Paris with much pomp late in 1944, and with varied, and partisan, reactions in the public. The French Academy elected two new members, Emile Hen-

riot, a critic, and Edouard Le Roy, a philosopher, to replace Ernest Prévost and Henri Bergson. Colette was elected at the Goncourt Academy, to replace a writer who resigned, La Varenne; she is the first woman to be a member of that body of ten writers since Théophile, Gautier's daughter. The P.E.N. Club resumed its activities in Paris, with Charles Vildrac as Secretary-General. André Gide was back from North Africa, still revered by some, attacked by others. Literary prizes were again distributed with the usual fanfare of publicity and the real interest of the reading public: the Prix de la Pléiade which had gone to *Enrico*, by Mouloudji in 1943, crowned *Brutus*, by Roger Breuil. The Prix Populiste went to *Travail d'Homme*, by Emmanuel Robles, a colorful story of workmen building a dam, written with much social sympathy. The Prix Goncourt launched a collection of four brief novels, all centered around life in the Resistance movement, by Aragon's wife, Elsa Triolet, *Le Premier Accroc coûte deux cents francs*. A very important place is given to literature in the weekly newspapers: *Carrefours*, *Lettres Françaises*, in the weekly supplement of *Le Figaro*. *Les Nouvelles Littéraires*, under the editorship of Frédéric Lefèvre, appeared again on April 5, 1945. Among the monthly or quarterly reviews, whose number is steadily growing, are: *Etudes* (of the Jesuits), *La Vie Intellectuelle* (of the Dominicans), *Renaissances*, *La Nef* and *Fontaine* (all moved from Algiers to Paris), *Les Cahiers du Sud*, *Esprit*, *Messages*, *Confluences* (Lyon and Paris), *L'Arbalète* (Lyon), *Formes et Couleurs* (Lausanne), *La Revue de Paris*, *La Table Ronde* (with Thierry-Maulnier), *Les Temps Modernes* (with J. P. Sartre), *Saisons* (with Marcel Arland), *Les Quatre Vents* (with Henri Parisot), *Delta* (Angers), *Espaces* (Clermont-Ferrand), etc.

Biography, Criticism and Historical Works. Volumes dealing with French history were less numerous than during the war years when oppressed French readers turned to their past for a message of hope. But the public, isolated for several years, showed great eagerness to be informed about the outside world, especially Russia and America, and much desire to learn about the precise history of the Second World War, its causes and its probable consequences. Maritain's addresses to the French people between 1941 and 1944 were published as *Messages* (N. Y., Maison Française); Focillon's *Témoignage pour la France* (N. Y., Brentano's) is a posthumous record of courageous and lucid vision. Philippe Soupault's *Le Temps des Assassins* (N. Y., Maison Française) relates the writer's imprisonment in Tunis in 1942-43; François Mauriac collected his articles written in 1944 and 1945, after a long-enforced silence, under the title *Le Baïllon dénoué*. Claude Roy gave a vivid picture of the liberation of Paris in *Les Yeux ouverts dans Paris insurgé*. Jacques Debû-Bridel retraced the events of 1938-42 in *La Déroute*, and Jacques de Lacretelle treated the same subject in a small volume unworthy of its subject and of its author, *Libérations*. Pierre Lazareff, in *De Munich à Vichy* (N. Y., Brentano's), gave some insight into the secret deals of politicians and diplomats. Charles Reine, in *Sous le Signe de l'Etoile* (N. Y., Brentano's) testified with effective restraint against anti-Semitism, and a young philosopher, recently freed from German prison-camps, analyzed the moods of his companions in *Essai sur la Psychologie du Prisonnier de Guerre*.

Many volumes were published in 1945 on the past literature of France, reflecting the public's constant interest in its favorite writers and prob-

lems. Interesting new editions of texts of much present day interest have been given: Balzac's *Louis Lambert* by R. de Renéeville, Baudelaire's *Ecrits intimes* by Sartre, *Sade's Infortunes de la Vertu* by J. Paulhan and Chamfort's *Maximes* by Camus. Agrippa d'Aubigné was reprinted in Neuchâtel by Marcel Raymond. Pierre Brisson, Thierry-Maulnier and Daniel Mornet wrote on Racine, Aug. Bailly on Beaumarchais, Pintard on the 17th century *libertins*, A. Béguin on Léon Bloy. Gerard de Nerval, a poet rediscovered by our contemporaries, was edited in two separate volumes by G. Le Breton and Pierre Messiaen. Balzac's life was related at length by André Billy, while Dr. Bonnet-Roy studied his relations with medicine and science and Claude Mauriac, the novelist's son, published *Atmer Balzac*. Y. G. Le Dantec and Jean Massin added to our knowledge of Baudelaire. Pierre Descaves presented *Mes Goncourt*. E. Rideau interpreted Mauriac for Catholic readers and clarified Valéry's work in a logical exposition of his ideas. Armand Hoog and Claude-Edmonde Magny have been the outstanding additions to the list of young French critics.

In the field of art, architecture aroused much attention, as is natural in a country intent upon rebuilding its cities and ports: Maximilien Gauthier and André L. Donné among others illustrate this interest in their books on *Le Corbusier* and *L'Architecte dans la cité*. Foreign literatures were not neglected. Shakespeare was again studied in three learned volumes by F. Baldensperger (Montreal, L'Arbre), L. Cazamian (*L'Humour de Shakespeare*) and L. Lemonnier. Dickens was translated anew, and edited in a monograph by Alain. Two renderings into French of E. B. Browning's *Sonnets from the Portuguese* (one being by André Maurois at Brentano's). Curiosity for American literature is no less keen in France: a collection of Edgar Poe was launched; Melville was translated as well as O'Neill; M. Coindreau ably criticized Erskine Caldwell and Ernest Hemingway in *Les Oeuvres nouvelles* (N. Y., Maison Française), and William Faulkner enjoyed a vogue second to none other in France today.

The Essay. Essayists continued to be among the most versatile and lively writers of France. Alain's prestige has decreased during the recent war. Suarès has written little in the last year. Du Bos's *Qu'est-ce que la Littérature?* appeared posthumously. Gabriel Marcel, with *Homo Viator*, Julien Benda with *La France byzantine ou le triomphe de la littérature pure*, a crusade against the excess of literature in France, and Bernanos with *Réflexions sur le cas des Français* were the outstanding essayists of 1945. Duhamel, whose imaginative inspiration seems dried up today, mixed moral reflections and personal reminiscences in his best recent work, *Inventaire de l'Abîme*. Among the philosophers of earlier ages, Plato has attracted most attention (Koyré, *Introduction à la lecture de Platon* and Hugo Perls, *Plato, sa Conception du Kosmos*, the latter an important and original treatise); then Nietzsche, whom a gifted essayist, Georges Bataille, reinterpreted, Renan whose prophetic political views are enjoying new favor today (E. Biré, *Renan et l'Allemagne*, N. Y., Brentano's), and Kierkegaard and Heidegger. From the last two thinkers, the doctrine of Existentialism was evolved which has spread like wildfire among French youth. It is a doctrine of lucid and unflinching pessimism, which rejects any transcendent presence and even any rational explanation of the universe, but exalts man as a stoic whose obstinate courage and

action can alone give meaning to a tragically absurd fate. J. P. Sartre is the leading philosopher of the group. A. Camus, in *Le Mythe de Sisyphe* and Simone de Beauvoir in *Pyrrhus et Cinéas* have presented his views to a wider audience.

Drama. The year 1945 has fully revealed the vitality of the French drama through the ordeals of the war. Theatres were prosperous, and many of their offerings have been characterized by a fine artistic level. André Obey was appointed director of the dramatic department of the Ministry of Fine Arts: a new director for the Comédie Française was harder to find, as Brisson, Bauer, Jouvett declined the honor after Pierre Dux had resigned. A. Salacrou was appointed to rule over the Odéon. Claudel's *Soulier de Satin*, Sartre's *Huis Clos* and Mauriac's *Les Mal Aimés* were the chief plays continued from 1944. Georges Neveux was awarded the Grand Prix du Théâtre for *Le Voyage de Thésée*. Giraudoux was celebrated and edited in a special number of *Confluences* and in two works by J. Houlet and Claude-Edmonde Magny. Foreign plays were staged with conspicuous success, notably *Antony and Cleopatra* in Gide's adaptation, *King Lear* in Dullin's interpretation, Morgan's *The Flashing Stream*, Eliot's *Murder in the Cathedral* and even two English novels turned into French dramas, *Wuthering Heights* and *Tess of D'Urbervilles*.

Fiction. Existentialist novelists constitute the most talented and the most vocal group among the young. Two volumes of Sartre's trilogy came out: *L'Âge de Raison* and *Le Sursis*, while Simone de Beauvoir published *Le Sang des Autres* and Maurice Blanchot *Thomas L'Obscur. Aurélien*, by the former Surrealist Aragon, is a charming evocation of Paris and of youthful love. The chief hope of Surrealist fiction is Julien Gracq, whose *Un beau Ténébreux* is more fastuous and weird than convincing. *Smeteling*, by the former Dadaist Ribemont-Dessaignes, is equally strange and more markedly morbid.

The older novelists seem to have yielded the stage almost completely to newcomers. Colette's *Gigi* is a pale image of her former self. Jules Romain's *Men of Good Will*, Vols. 23 and 24, have found the curiosity of the readers, and probably the freshness of the author, sadly blunted. Simone Téry wrote a pleasant though superficial story on the Spanish Civil War, *Où l'Aube se lève*; the widow of Saint-Exupéry revealed a light and charming talent in *Oppède* (N. Y., Brentano's). Elsa Triolet, in her Prix Goncourt volume, appears as a remarkably fluent story-teller though lacking in depth of analysis and in dramatic force. André Chamson, on his return to civilian life, brought out a striking picture of life during the German occupation, *Le Puits des Miracles. Les Amitiés particulières*, by Peyrefitte, was praised as the best psychological study of the year on a delicate theme to which Proust, Gide, and Cocteau had accustomed many readers. *Le Solitaire* by Marc Blampain, which received the Grand Prix du Roman, *La Ronde des Survivants* by G. Bonnamy and Mouloudji's *En Souvenir de Barbarie* (the latter far inferior to the same author's *Enrico*) were among the other important works of fiction.

Poetry. The splendid flowering of robust poetry which had marked the years of struggle and revolt was succeeded after the liberation of the country by a period of stock-taking. Resistance poetry has now become the official poetry of France. Eluard is acclaimed by all as the chief poet of the hour (*Au Rendez-vous allemand*); the influence of his obstinately and delicately erotic images is clear

over the best-gifted among the younger poets, Alain Bosquet and Henri Mougin. Henry Michaux remains isolated and original in his impetuous flow of visions and metaphors (*L'Espace du dedans, Lobe des monstres, Au Pays de la Magie*). Francis Ponge has uncommon gifts (*Le Gymnaste, La Jeune Mère*) and may become, as interpreted by Sartre, the poet of the existentialist group. Jean Genêt, in *Notre-Dame des Fleurs*, maintains the fierce tradition of rebellion dear to the country of Rimbaud. Jean Marcenac, a former Surrealist, recently liberated from a German prison camp like Henri Mougin, shows great promise. The leader of orthodox Surrealism, André Breton, resorted to a very harmonious and ornate prose to celebrate love, woman, and the purification of man's imagination, in *Arcane 17* (N. Y., Brentano's). Another poet of great talent, Pierre Reverdy, who remained silent during the last few years, published the first volume of his complete works.

Critics and estheticians of poetry are as numerous as poets in an age and in a country where poetry has taken an acute consciousness of its purpose and technique. Jean Paulhan, in *Clef de la Poésie*, is an acute analyst of poetical language; Aragon published an Essay on *Les Circonstances de la Poésie*; Maurice Nadeau's *Histoire du Sur-réalisme* is the best historical account of that movement published thus far. Among the poets of the past to whom our contemporaries turn most fervently, thus revealing their own affinities, are Maurice Scève (edited by Béguin), Charles Cros (*Poèmes et Proses* published at Gallimard's), Tristan Corbière for whom 1945 marked the hundredth anniversary, Pierre Louys edited by Y. G. Le Dantec and edited by A. Cardonne, and Mallarmé, whose complete works in prose and verse were published by Henri Mondor in the *Pléiade* edition. St. John Perse's *Anabase* appeared in a new edition at Brentano's and Claudel's *Cinq Grandes Odes* at Montreal (Fides).

Conclusions. The first year of freedom from oppression found French literature buoyantly proud of its fine record in the Resistance movement and having lost none of its prestige in France or abroad. Variety, effervescent vitality, high artistic achievement were its distinctive features. A cleavage seems to have been dug deep between the younger writers and the older masters who were the chief glories of French letters before 1940. Claudel, Gide, Martin du Gard, Duhamel, Mauriac seem today to belong to another age; the new generation of writers recognizes no masters among its elders. Malraux, Aragon, Eluard, Sartre, and Paulhan are its most respected leaders. No dominant note is struck by such divergent and individual talents, but a greater seriousness than was noticeable after 1919 characterizes the writings of 1945. Philosophical preoccupations occupy the first place even in the minds of novelists and poets. Their attitude to life and the world is tinged with tragic pessimism, for it spurns the illusions which had lulled their predecessors into complacency; but it is an active pessimism, which is determined to find new reasons for living through its own lucid search for a new truth. Finally, the majority of these writers refuse to be isolated from life. They have been steeled in the fire of action; they write in newspapers, take part in political struggles, are keenly conscious of social and international problems. Their literature is not the decorative game of esthetes, but an earnest endeavor to guide men to know themselves and the world better, and to change the world and themselves if possible.

HENRI PEYRE.

FRENCH NORTH AFRICA. Consists of the northwest corner of Africa, except for certain small Spanish territories (see SPANISH AFRICA), and is known to the Arabs as "el Moghreb"—"The West." Its territory is divided among Algeria (847,500 sq. mi.), French Morocco (153,870 sq. mi.) and Tunisia (48,300 sq. mi.).

Government. Northern Algeria is for most purposes treated as an integral part of France. It is divided into three departments (Oran, Algiers, Constantine) in which the adult French population elects representatives to the legislative bodies in Paris. The over-all authority is exercised by a Governor-General who is responsible to the Minister of the Interior in Paris. Natives are represented only on local bodies such as the *Délégations Financières*. The number of Moslems who enjoy French political rights is quite small, but will probably be greatly increased in the near future (see EVENTS). South of the three departments, in the Sahara, lie the four Territories of the South, which form a separate colony under military command.

The empire of Morocco is theoretically an absolute monarchy, but in reality it is a French Protectorate where power is exercised by the French Resident General, who is also the Minister of Foreign Affairs and is responsible to the Ministry of Foreign Affairs in Paris. Under the Resident General is an extensive administration, French in its higher levels but with increasing numbers of natives in the local areas. In some parts of the interior military, rather than civil, administration has been the general rule, since these areas have been "pacified" only recently. The capital of the French regime is at Rabat, though the Sultan occasionally resides in one of the other historic capitals—Fez, Marrakesh, and Meknes.

Tunisia, like Morocco, is a French Protectorate and thus under the direction of the Foreign Ministry in Paris. An hereditary Bey nominally rules over the Regency, but the actual administration is under the control of a French Resident General who is also the Minister of Foreign Affairs for Tunisia. He presides over a cabinet in which some of the departments are headed by Tunisians. Local affairs, both judicial and executive, are to a considerable extent under the administration of native officials. The capital is at Tunis. There are no over-all representative institutions in either Morocco or Tunisia and, being Protectorates, they are not represented in the legislative bodies of Paris.

Events, 1945. Conditions in North Africa continued to be unfavorable. The economy of the country had been disrupted by war. The Government in Paris was so immersed in the problems of the homeland it could not give proper attention to the overseas territories. Consumer goods of all sorts, notably clothing and food, were very scarce. To cap the climax came another year of drought. By early summer near-famine conditions prevailed in some regions and the Paris authorities found it necessary to have some of the American wheat shipments bound for France rerouted to North Africa. Figures for the 1945 harvest, available in July, showed a wheat crop of only 1,300,000 tons, compared with the normal production of 4,500,000 tons. To help meet the situation an attempt was made to cut the bread ration from 300 to 250 grams a day, but this had to be abandoned when riots broke out.

Out of this explosive situation bloody riots erupted on V-E Day at Sétif and neighboring centers in eastern Algeria. News of these outbreaks was slow in filtering out through the local censorship to the world at large. On May 11, the

French Cabinet, in announcing measures to allay unrest, indicated that the scarcity of grain was "responsible for present difficulties." Political causes seem also to have entered into the picture, including events in the Levant (see SYRIA AND LEBANON). Alarmist reports gave the casualties arising from the outbreaks as over 10,000, which were said to have resulted from a nine-day campaign in which airplanes and artillery were used. Official French statements put the figures much lower, the Minister of the Interior conceding only 90 Europeans killed and 150 wounded, and 1,500 dead among the natives. Out of the 50,000 who were said to have rioted on May 8, there were 2,400 arrested in reprisal. On June 16 thirteen natives were condemned to death by a military court for their part in the disturbances.

The situation failing to improve, the French Government late in June sent its Minister of the Interior, M. Adrien Tixier, to Algeria to investigate on the spot. On July 3 he felt able to state that calm had been reestablished in the Department of Constantine. He also revealed plans for "the integration of Moslems into the French community" by giving them new political and social guarantees, including a change in the manner of Algeria's representation in the National Assembly and the extension of the franchise to 800,000 Moslems. The progressive assimilation of Algeria into the French scheme of things was the solution envisaged for this region during discussions in the Consultative Assembly early in the summer.

The municipal elections of August 6 in Algeria indicated a victory for the Left, which won 31 seats with five going to the Conservatives and fifteen to Moslem candidates. The restricted franchise and the boycott preached by the outlawed nationalist parties robbed the election of any deep political import.

The resumption of private trade between the United States and French North Africa was permitted after July 1, thus making it possible for much-needed manufactured items not obtainable from France to be imported from America. An immediate market for \$100,000,000 worth of American goods, exclusive of wheat, was foreseen by M. Cardin, Director of French North African Economic Affairs.

The state of economic affairs in Morocco and Tunisia was similar to that in Algeria. In Tunisia some of the cities, notably Bizerte, were being rebuilt almost from the ground up. Vineyards, olive groves and grain fields were still feeling the effects of passing armies. In Morocco, where the drought had been severe, there was the paradox of large herds of livestock, due to the producers' inability to effect normal exports.

On March 15 the High Court of Justice in Paris sentenced Admiral Jean-Pierre Esteva, Vichyite Resident General in Tunisia, to life imprisonment for treason and intelligence with the enemy while occupying that post in 1942-43.

In mid-June the Sultan of Morocco, Sidi Mohammed, went to Paris to be fêted and to discuss *inter alia* the status of Tangier (see TANGIER). The Bey of Tunis, Sidi Mohammed el Amin, arrived in Paris a month later in time to participate in the celebration of Bastille Day. During the year the United States Army used Casablanca as one of the principal centers from which it despatched soldiers home by air.

The Population. The population of Algeria in 1936 numbered 7,234,684, of which nearly one million were European. Only a tenth of Algeria's inhabitants live in the vast desertic Territories of the

South. Arabic is the predominant language spoken by the Moslems, with Berber dialects found in certain districts. There are also Jewish communities in the cities. The education of the natives is provided largely by Moslem schools, which are attended by only a small part of the population. For the Europeans there is the regular French scholastic hierarchy, culminating in the University at Algiers.

In 1936 the population of the French Zone in Morocco was 6,298,528, of which 5,874,888 were native Moslems, 161,312 native Jews, 173,533 French, 59,058 other Europeans. (All these figures have probably undergone considerable change during the last decade.) The native population consists largely of Moslemized Berbers and the descendants of the Arab invaders of the early medieval period. There has also been a considerable intermixture of Negro blood imported across the Sahara. Under French rule the major cities of Morocco have grown rapidly, until today Casablanca has a half million inhabitants, while Rabat, Fez, Marrakesh, and Meknes all exceed 100,000. Berber is still used by a considerable portion of the natives, especially in the interior. Along the coast, however, Arabic has become the common tongue. In general the educational facilities available for the Moslems are limited and outside the populated centers are provided mostly in religious schools. There is, however, the noted Kairoween University at Fez. For the European population there are a number of primary and secondary schools. At Rabat there is also the Institut des Hautes Etudes Marocaines.

In 1936 the population of Tunisia was 2,395,623 Moslems, 59,485 Jews and 213,205 Europeans. Included in the latter figure were 108,068 French and 94,289 Italians. However, these figures are deceptive since a great many of those counted as French are of Italian ancestry. The Moslems are largely Arabic-speaking, the principal exceptions being found among certain tribes in the south. The European population is almost entirely Roman Catholic. Education is provided partly by religious and other private funds, and partly by the Government. As elsewhere in North Africa, the European population is much better educated than the mass of the natives.

The Country's Economy. In all three countries agriculture is the principal occupation of the natives. The chief crops are wheat, barley, oats and other cereals. Tobacco is raised extensively in Algeria. Olive oil is produced in large quantities, notably in Tunisia, where in the south large tracts are covered with cultivated olive groves. Cork and almonds are produced in Morocco, while citrus and other fruits are widely cultivated in the warmer zones of all three countries. Wine is an important product in Algeria and Tunisia. Sheep, goats and cattle are raised in large quantities throughout French North Africa. Fisheries are found along the coasts and provide food both for local consumption and for export.

Algeria produces important amounts of iron ore (2,325,500 metric tons in 1937), phosphate rock (566,571 metric tons in 1937), lead and zinc. Morocco's principal mineral product is phosphate (1,447,327 tons in 1938), while zinc, lead, iron ore and manganese are also extensively mined. Phosphate rock is also the principal export mineral of Tunisia (1,608,045 metric tons in 1939), with iron ore coming second (764,731 metric tons).

By and large the manufacturing industries of French North Africa are still in a rudimentary stage—a fact which greatly handicapped the use

of that region as a base for the Allied invasion of southern Europe in 1943. Present plans call for an acceleration of the process of industrialization.

Figures for foreign trade have not been available for a number of years, but those for the pre-war years reveal that by far the lion's share went to France. Internal communications are provided by a railroad network that extends all the way from the Gulf of Gabes to Marrakesh. Altogether there are over 5,000 miles of railroad, supplemented by several thousand miles of improved highways. Modern ports exist at such places as Casablanca, Oran, Algiers and Tunis, and there are naval bases at Mers-el-Kebir and Bizerte.

ROBERT GALE WOOLBERT.

FRENCH OCEANIA. The French possessions in the eastern Pacific, comprising several groups of islands. The principal groups are: Society, Marquesas, Tuamotu, Leeward (Îles sous le Vent), Gambier, Austral, and Rapa Islands. Clipperton, an island 670 miles southwest of Mexico has been included in French Oceania. Tahiti (600 sq. mi.; pop. 19,029 in 1936), of the Society group, is the main island. Total area, 1,520 square miles. Total population (Nov. 1, 1941), 51,221. Capital: Papeete (on Tahiti), 11,614 inhabitants in 1941. Chief products: copra, vanilla beans, phosphate, and mother-of-pearl are the chief products. Foreign trade (1941): imports 53,429,000 francs; exports 124,583,000 francs. The budget (1941) was balanced at 28,800,000 francs. The Government is under the control of a Governor, assisted by a private council and an assembly of financial and economic delegations. Governor, Colonel Orselli.

FRENCH WEST AFRICA. A vast territory comprising the administrative divisions indicated in the following table:

Colony	Sq. Mi.	Pop. (1941)	Capital
Dahomey	43,232	1,424,220	Porto-Novo
Dakar*	60	165,188	Dakar
French Guinea	96,886	2,117,705	Conakry
French Sudan	590,966	3,794,270	Bamako
Ivory Coast	184,174	4,047,041	Abidjan
Mauritania	323,310	866,853	—
Niger	499,410	1,944,190	Niamey
Senegal	77,730	1,723,068	St. Louis
French West Africa	1,815,768	15,582,535	Dakar

* Including dependencies. † The lieutenant governor of Mauritania resides in St. Louis, Senegal.

Togo, a narrow mandated territory lying between Dahomey and the Gold Coast with an area of 21,893 sq. mi., is included under this heading, though administratively it is separate from French West Africa.

Government. For French West Africa as a whole there is a Governor-General, assisted by a Council. Each colony, including the Circonscription of Dakar et Dependences, has in addition its own Governor. The Governor-General supervises the administration of these governors, but leaves to them the details of local government. There is a general budget covering certain matters of common interest to all of French West Africa; but there are also separate budgets for each of the colonies. The financial estimates for 1943 showed a budget balanced at 3,017,818,000 francs. Senegal, being one of the older French colonies, has been represented in the Parliament at Paris by an elected deputy.

Very few of the natives are French citizens (except in and around Dakar) possessing the political rights associated with that status. However, the proposals of the French Provisional Government for a federal union between France and her

colonies provide for a greater equalization of political status among all the inhabitants of the French empire. The capital is at Dakar. Togo is a Class B Mandate; its capital is Lomé.

Events, 1945. The war had cut off the country's normal flow of imports, thus creating a great scarcity of clothing and all sorts of manufactured goods. Since it would take some time for France to rehabilitate her industry sufficiently to supply this market, her West African possessions had to look to the United States for relief. This was provided by a decision of the United States Government, reported in mid-January, to permit the resumption of private trade with French North and West Africa.

The war had also disrupted the normal flow of exports, thus causing West African products to accumulate. Early in the year some 120,000 tons of coffee and 60,000 tons of cocoa from the Ivory Coast and Dahomey were awaiting transport to France. The peanut crop, the country's largest export, was only one-half the normal volume due to various causes, natural and political.

In February the French Cabinet revealed ambitious plans for the construction of a great military, naval and air base at Dakar to serve the interests of the French empire as well as of the new collective security under the San Francisco Charter. The government also sent out three town-planning experts to replan the city of Dakar for an eventual population of 500,000 inhabiting an area equal to that of Paris. Meanwhile work went ahead on the extensive irrigation scheme started under the Vichy regime on the Niger above Timbuctoo. This project, in which lessons learned from the T.V.A. in America were used, provided for the construction of new villages, the setting-up of marketing co-operatives and in general raising the natives' standard of living. Surveys were also conducted to show how transport could be speeded up between French West Africa and Morocco by way of the Sahara.

People. Out of the 16,000,000 inhabitants only some 25,000 are Europeans. The natives are largely Sudanese Negroes, but with strong Hamitic influences in many areas of the Sudan and in the Sahara. These elements are the results of migrations from North Africa and the Nile Valley, which also introduced the Mohammedanism professed by many of the inhabitants in the drier parts of French West Africa. The southern zone, lying in the belt of tropical rain forests, is largely pagan except where Christian missions have made converts.

Elementary schools are small in number and are provided partly by the government and partly by missionaries. The natives are encouraged to learn French, which is useful for obtaining employment in the government service or in European-owned enterprises. By and large the French authorities appear less concerned to preserve the native's culture and tribal institutions than are the British in their West African colonies. The William Ponty Normal School at Dakar provides training for various professions. In the same city is the French Black Africa Institute for the study of African culture and languages.

The Country and Its Economy. The climate, which is hot and wet on the Guinea coast, becomes progressively drier to the north. In terms of vegetation this means that the coastal forest shades off into the open savannas of the Sudan and finally into the world's greatest desert—the Sahara. Occupations are conditioned by these climatic circumstances. In the south the important products are cocoa, coffee, palm oil and kernels, tropical fruits and rubber. In the drier regions they are cotton, cereals,

peanuts, cattle, sheep and goats, and hides and skins. Figures illustrating the volume of exports are (for 1942) peanuts, 81,485 tons; cocoa, 28,594 tons; palm kernels, 41,669 tons; coffee, 19,984 tons. Interesting native industries are to be found in Dahomey and Togo, and to a lesser extent in some of the other colonies.

There are over 2,500 miles of railway and many thousands of miles of usable roads; a considerable section of the middle Niger River is navigable by shallow-draft vessels. The principal ports are Dakar, Conakry, Abidjan-Port Bouet and Cotonu. In 1942 the total value of imports was 1,821,430,000 francs, and of exports 1,451,628,000 francs.

ROBERT GALE WOOLBERT.

FRIENDS, Society of (Quakers). A religious society founded in England by George Fox (1624–90) which stresses the direct spiritual guidance of the Holy Ghost, called the Inner Light, repudiates war, a paid ministry, and the outward observance of the sacraments or any religious ritual. There are four denominations in the United States, of which the Society of Friends (Orthodox) is the oldest and largest, and the Religious Society of Friends (Hicksites), a liberal group, is equally active. Orthodox headquarters, Richmond, Ind. For statistics see RELIGIOUS ORGANIZATIONS.

GENERAL ACCOUNTING OFFICE. An agency of the U.S. Government, created independently of the other agencies, to secure the uniform settlement and adjustment of all claims and accounts in which the United States is concerned. Comptroller General of the United States in 1945: Lindsay C. Warren.

GENERAL EDUCATION BOARD, The. An institution incorporated by an act of Congress in 1903, with the stated object of promoting education within the United States of America without distinction of race, sex, or creed. The present program of the Board is restricted almost entirely to the support of educational work in the southern states.

The Board is empowered to spend the income and the principal of its funds. Among its appropriations in 1945 were: \$70,000 to the University of Alabama for its public administration program, of which amount \$30,000 is for the support of the Bureau of Public Administration and \$40,000 for advanced regional fellowships in public administration; \$95,000 to the Phelps-Stokes Fund, New York City, toward a program for the Negro rural church, including the training of Negro rural ministers; \$24,700 to the George Peabody College for Teachers, Nashville, Tennessee, toward support of a Regional Materials Service in connection with the movement to have education play a more vital role in the development, understanding, and utilization of the natural and institutional resources of the South; \$76,900 to be apportioned among the universities of North Carolina, Arkansas, Virginia, the American Council on Education, Alabama State Department of Education, and Alabama Polytechnic Institute, for preparation and testing of educational materials dealing with the natural and other resources of the South; \$19,470 to the University of Kentucky toward a study of the actual and potential utilization of the forest resources of the Eastern Kentucky highland region; \$45,000 to the Southern Highland Handicraft Guild and \$25,000 to the University of Tennessee toward the support of a program of craft education in the southern highlands; \$20,000 to Harvard University for visiting fellowships in the Graduate School of Business

Administration for faculty members of Southern institutions; \$30,000 to the Nashville School of Social Work toward its support for a three-year period; \$25,000 to Our Lady of the Lake College, San Antonio, Texas, toward the support of its Graduate School of Social Service; \$25,000 to the United Negro College Fund, Inc., toward the raising of a fund for the maintenance of privately supported institutions for Negro education; \$15,770 for salaries and traveling expenses of State agents for rural schools for Negroes in the State departments of education of southern states; \$41,000 to the Georgia School of Technology toward the purchase of scientific instruments and equipment; \$25,940 to University of Chicago for study and development of new-type verbal tests of general intelligence applicable to all children irrespective of social and cultural status; \$15,000 to the Alabama Polytechnic Institute toward support of a program in rural community development; \$10,000 to Virginia State College for Negroes toward a project for community development for Negroes; \$14,000 to the Mississippi State Department of Education toward support of summer training courses for white and Negro teachers and health workers in connection with the development in public schools of a coordinated program of health education and health service; and \$6,200 to North Carolina State Department of Public Instruction, for a similar purpose.

The executive officers during 1945 were Walter W. Stewart, chairman of the board of trustees; Raymond B. Fosdick, president; Albert R. Mann, vice-president and director; William W. Brierley, secretary; Edward Robinson, treasurer; George J. Beal, comptroller; Thomas M. Debevoise, counsel; Chauncey Belknap and Vanderbilt Webb, associate counsel. Offices: 49 West 49 St., New York City, N. Y.

GENERAL LAND OFFICE. An Office of the U.S. Department of the Interior which supervises the survey, management, and disposition of the public lands and the minerals therein. During the war the Office made large tracts of land available for military uses. Commissioner: Fred W. Johnson.

GEOGRAPHICAL NAMES, U.S. Board on. A branch of the U.S. Department of the Interior, successor to the U.S. Geographic Board, which is the official authority on the use of geographic names by the Government. Director: Meredith F. Burrill.

GEOLOGICAL SURVEY. Funds aggregating 12½ million dollars, about one-half of which were derived from direct appropriation by Congress and the other half from cooperative agreements with other Federal agencies and with States, counties, and municipalities, were made available for the Geological Survey's work in 1945. These monies were wisely spent in war-expanded investigations of mineral and water resources, land classification, mineral leasing, and topographic mapping. The resulting reports and maps, often prepared at the urgent request of the fighting forces, contributed not only to the success of arms but, by the development of new methods and techniques, to the restoration of a sound national economy in the difficult years ahead. Commercial supplies of mercury, chromium, vanadium, tungsten, manganese, etc., reached a new low in 1945, while reserves of petroleum were taxed to the utmost and once bountiful pools in the ground were actually endangered by far too heavy withdrawals. It was the Geological Survey's mission to point the way

to replenishment by locating new deposits, particularly of the metals and petroleum, and to advise concerning their recovery and the utilization of low-grade ores that were known to the geological profession but were little used in the days of plenty. Thus the Geological Survey carried on its vital work, mostly on the home front but not without timely participation within the zones of war.

It was not until the closing months of the war that the Military Geology unit, organized at the outset of hostilities at the request of the Army Engineers, became known to the general public. Its studies of foreign terrain were expanded markedly in 1945, when the nation concentrated its industrial as well as its military might on an early conclusion of the war. Fifty members of the unit were dispatched to the theater of operations either as scientific consultants in combat zones or on assignments connected with operational intelligence. Concurrent with those studies the Survey continued its cooperative investigations of mineral deposits in other American Republics. Under the auspices of the State Department and the Interdepartmental Committee for Scientific and Cultural Cooperation, thirteen different mineral commodities were studied in Mexico, Cuba, Chile, Brazil, the Dominican Republic, and Haiti. In the continental United States, mineral fuels investigations looked primarily to obtaining geologic data on additional supplies of petroleum and appraising the potentialities of substitutes for liquid petroleum, even though the Survey confidently expects to find new sources of supply. The likely sources of substitutes in large quantity are oil shales and the low-rank coals, especially those of the Rocky Mountain States. In the field of metallic minerals emphasis was placed on fundamental geologic studies of the principal ore-producing districts in order to provide a proper foundation for future exploration. At the end of the fiscal year field work in 21 major districts was under way, and some of the work had already produced worthwhile results. The project at San Manuel, Ariz. is an example; there the Geological Survey cooperated with the Bureau of Mines in a drilling program that indicated copper reserves of possibly as much as 64 million tons of ore averaging 0.8 to 0.9 per cent of copper, which is a small fraction of a per cent below the 1.0 to 1.1 per cent copper ores worked in large volumes in Utah and Arizona. Many smaller projects, involving work on eight of the so-called strategic minerals, were completed in 1945. Bauxite investigations, begun in 1941 and carried on jointly with the Bureau of Mines, were practically concluded during the year. They increased, by about 10 million tons of ore, the known national reserves of approximately 75 million tons. Fluorspar production also gained impetus from the Survey's field work in 15 States, while investigations of the other non-metallic deposits, such as talc, clay, and corundum, added to the Nation's storehouse of mineral reserves. In this last connection, the work of the Survey's Alaskan geologists deserves special mention, for their investigations of a large number of mineral deposits in the Territory have added immeasurably to the Nation's mineral wealth. During the 1944-45 field season their efforts were directed chiefly to studies of petroleum, coal, quicksilver, copper, tin, and zinc, 19 projects in all having been brought to successful conclusion. Along with these studies continued the work of the specialized unit that compiles the aeronautical pilotage maps and charts from photographs furnished by the Army Air Forces.

Through the network of its numerous field offices located at strategic points throughout the United States, the Survey in 1945 eclipsed the work of all previous years in the investigation of surface and underground waters, more than one-third of the overall cost of which was borne by States and municipalities. Other Federal agencies, including the Office of the Chief of Engineers, Mississippi River Commission (War Department), Bureau of Yards and Docks (Navy Department), provided nearly a million dollars for water resources work that could not be financed by direct appropriation or included in cooperative programs. Records of the stage, quantity, or availability of surface waters were collected at about 5,600 gaging stations distributed throughout every State of the Union and the Territory of Hawaii. These records serve as the basis for constructing, operating, and administering municipal and industrial water supplies, irrigation systems, power plants, flood-control works, and the like. Ground-water investigations, relating to water from which wells and springs are supplied, covered the source, occurrence, quantity, and head of these waters; their conservation and replenishment; their availability and adequacy for domestic, industrial, irrigation, and public supplies, and as watering places for livestock; and the methods of constructing and utilizing wells and of improving springs. In 1945 there were periodic investigations of water levels or of artesian pressure in about 7,000 observation wells. A study of these records will aid in determining the depletion of underground waters caused by the numerous war industries and other war establishments that obtained their supplies from wells, and in providing against possible shortages. Many of the engineers in ground-water work were also assigned to overseas combat zones, in military or civilian capacity, for water supply work. Nearly 7,000 analyses of water samples were made in the Survey's laboratories, many of them representing studies of water supplies for Army and Navy establishments and for munition plants and housing developments.

The Survey's principal mapping unit, the Topographic Branch, gave its major energies to the production of maps for the War Department. Prepared from aerial photographs in the Arlington, Va., Chattanooga, Tenn., Rolla, Mo., and Sacramento, Calif., offices of the Survey, the maps in manuscript form covered thousands of miles of territory at home and abroad but chiefly beyond the seas. More than 64,000 square miles of foreign soil were mapped during the year, about 60,000 of them before V-E day. Similar maps of areas in the United States published during the year included 183 maps of regions designated by the War Department as strategic. A total of 586 quadrangles were thus covered by the Survey between the beginning and near-end of the war. Work on the millionth-scale map, a project begun years ago by Great Britain, Russia, the United States, and other nations for making a map of the world on a uniform scale, proceeded to the point of preparing for publication Sheets H-14 (Austin), H-15 (Mississippi Delta), I-17 (Savannah), I-18 (Hatteras), K-10 (Mt. Shasta), K-17 (Lake Erie), and L-10 (Cascade Range). Each sheet of the millionth-scale map comprises six degrees of longitude and four degrees of latitude, or an area somewhat smaller than that of the State of Wyoming. Continuing its work on the Transportation Map of the United States, the Survey published during the year 14 sheets covering areas in New Mexico and had others of parts of North Carolina ready for

publication. Topographic surveying was done in 35 of the States. The work was carried on in cooperation with 19 of the States and with the Tennessee Valley Authority. Special projects included 10 maps for use in connection with Survey investigations of strategic and critical minerals; 16 in furtherance of flood-control work by the Army Engineers; and five for irrigation and reclamation projects of the United States Bureau of Reclamation.

In mineral classification matters submitted to the Geological Survey for technical advice, the records showed an increase of 20 per cent in the number of cases completed. More than 13,000 cases, each involving one to many geologic determinations, were acted on during the year. In addition, initial or revised definitions of the known geologic structure of seven producing oil and gas fields were prepared and promulgated, increasing the net area so defined in nine public-land States to 1,888,328 acres on June 30, 1945; geologic appraisal was made of 80 unit-plan submissions; and 53 special reports were rendered to the General Land Office on new discoveries of oil or gas on or adjacent to Federal lands, including 22 applications for the royalty benefits accorded by law for the discovery of new oil or gas fields or deposits during the national war emergency. Water and power classification work added 110,278 acres of power-site reserves in 22 States and Alaska; maps representing 180 miles of stream valley and 18 dam sites; final action involving hydraulic determination on 267 cases received for report from Departmental sources and from the Federal Power Commission; and water-power classification on 1,939 cases, which also involved mineral classification. A marked increase was also recorded in the Survey's mineral lease supervision on public lands. More than 7,000 oil and gas properties were under supervision at the end of the fiscal year, aggregating 4,596,053 acres in 20 States and Alaska, an increase of 32 per cent in the number of properties and nearly 48 per cent in the average acreage under supervision at the close of the previous year. Drilling on public lands included the spudding of 566 wells and the completion of 626 wells, 440 of which were productive of oil and gas and 186 barren. The production of potash was maintained at a high level, and sodium plants ran at maximum capacity to meet war-induced demands for chemical products used in the manufacture of bombs, percussion caps, shells, smokeless powder, etc.

Particularly active during the year were the Survey's shops that equip the scientific and technical staffs. In addition to their regular job, these skilled mechanics made a number of unusual devices that materially aided important war work. There was the Graph Subdivider, for example, used to convert graphical records of the gage heights of rivers into figures representing the daily mean discharge. A Tick Graduator, which divides distances between degree lines on map grids into 60 equal parts representing minutes and cuts the graduations (called "ticks") through the photographic emulsion on glass plates, also took its place among the long list of precision instruments made by the Survey; and then came the Stereo Plotter, which portrays on maps the contour lines derived by the floating dot method from vertical aerial photographs.

Publications, too, appeared in greater number than in 1944. In addition to the regular series of professional papers, bulletins, and water supply papers, there were a number of miscellaneous publica-

tions and a variety of maps, noteworthy among which were the preliminary maps of the oil and gas investigation series. These were the result of the program of regional geologic studies begun in July 1943 in many States where there were possibilities for the discovery of new supplies of petroleum and natural gas. Released at a rate of approximately four each month, 35 preliminary maps and nine preliminary charts in the oil and gas and war minerals investigations series had appeared at the close of the fiscal year. A total of 2,396,731 publications of all types were received and 1,228,424 were distributed.

JULIAN D. SEARS.

GERMAN LITERATURE. At the moment of writing, a few months after final defeat of Nazi Germany, German literature is still in a state of utter chaos. Toward the end of the war German literary activity had, with the exception of a handful of privileged Nazi writers, been totally suppressed. Managers of many of the famous German publishing houses disappeared into concentration camps; other houses were bombed out; in nearly every case libraries, bookshops were shut down or destroyed, or stock burned. Now, after the collapse, it is clear that Nazism added nothing of value to German literature. If a new literary generation exists, their manuscripts have not yet been found.

According to early reports, a few of the better-known writers were able to save their lives and are now working for the occupation forces, men like Ernst Glaeser, W. Sueskind, E. Penzoldt. Gerhart Hauptmann, far over 80, is living in Agnetendorf and has offered his spiritual and moral support to the Fatherland—as he did to William II, to the Weimar republic, and to Hitler. A newly founded Association for the Reconstruction of German Culture is headed by the ex-expressionist Johannes R. Becher who, like the playwright Friedrich Wolf, has returned from a long period of exile in Soviet Russia to Berlin. German theaters immediately started to revive pre-Nazi authors, like B. Brecht, Carl Zuckmayer, W. Hasenclever (who committed suicide in France). The only sincere and impressive voice so far has come from Heidelberg, where the philosopher Karl Jaspers opened the university with a very moving speech. Within recent weeks certain German publishing houses received licenses to renew their activities. The first was the small firm of H. Meister (in Heidelberg), known only to a few connoisseurs of sophisticated poetry. In the American zone (Wiesbaden) and in the British zone (Hamburg) S. Fischer, Goverts, Brockhaus, Eugen Diederichs, and the distinguished Insel Verlag followed. Inexpensive translations of American writers, contracted for by the U. S. Government under standard conditions, are being distributed in the American zone. The only surviving German publishing-house-in-exile, on the continent, the Bermann-Fischer Verlag in Stockholm, has been active throughout 1945, in spite of transportation difficulties. Considerable stocks of German books, apparently lost or seized, have been recovered in the Netherlands and are now in great demand.

1945 brought the seventieth birthday of Thomas Mann, and in this connection, he made a remarkable speech on "The Germans" before the Library of Congress, to which he is Consultant for German Literature. On the occasion of Mann's birthday there was a special issue of the *Neue Rundschau*, a magazine which before Hitler was the best known literary organ in Germany. The *Neue Rundschau* will from now on appear (Bermann-Fischer, Stock-

holm) as a quarterly, its first regular issue contains contributions by Thomas Mann, T. S. Eliot, Lise Meitner (the atom scientist), J. Maass, O. Loerke, Roosevelt, Zuckmayer and Gumpert. It will soon publish some impressive verse written by Albrecht Haushofer (the son of the geopolitician), during his long stay in Nazi prisons and concentration camps.

Thomas Mann, after the Nazi collapse, became involved in a controversy with W. von Molo, head of the German Poet's Academy, who had invited him to return to Germany. Mann declined, referring, in his answer, to his sense of loyalty as a recent American citizen. A special American edition of his *Moses* appeared in 1945; and Mann's works in German have now been completely republished in Stockholm. His new novel about a modern German composer, a study of art and insanity, is almost finished.

Some of the German writers in exile have died—Franz Werfel and Bruno Frank in Los Angeles, Richard Beer-Hofmann, the Austrian poet, in New York. Werfel's last work, *Stern der Ungeborenen* (Star of the Unborn), has just come out in Stockholm: it is the story of a gigantic Utopia of a world, a hundred thousand years from now, the vision of a physical, technical and spiritual transformation of the cosmos. Four philosophical and religious essays, "*Zwischen oben und unten*" (Between Above and Below), have likewise appeared in Stockholm. Bruno Frank's last novel *Die Tochter* (The Daughter) was published in Stockholm (in 1943 in Mexico). Lion Feuchtwanger's final or latest Josephus novel *Der Tag wird kommen* (The Day Will Come) was published in German (Stockholm). Feuchtwanger is now working on a novel about Benjamin Franklin. Leonard Frank, with two unpublished novels, has come to New York from Hollywood where his post-World War I novel, *Karl und Anna* is now being filmed by MGM. Alfred Doeblin has gone to Baden-Baden to serve as an official with the French occupation authorities. He has finished a large novel about Germany after World War I. Annette Kolb has returned to France. W. Speyer has finished a large novel about Berlin, from the Hohenzollerns to Hitler.

There have been recent editions in both German and English of an autobiographical novel by a younger German writer, Joachim Maass, now a teacher at Mt. Holyoke, *Das magische Jahr* (The Magic Year). Furthermore, of Carl Zuckmayer's novelette *Der Seelenbräu* (the author now leads a rustic life in Vermont); of C. Weiskopf's *Himmelfahrtskommando* (a Czech-German, living in New York); and of Vicki Baum's *Kautschuk*. Alfred Neumann (who lives in Hollywood) recently had published an excellent novel in English based on the rebellion of the seven Munich students who were later executed by the Nazis. H. Kesten's new novel, *The Twins*, will soon come out in New York—published by L. B. Fischer, which issued Martin Gumpert's *Hahnemann, the story of a medical rebel*. E. M. Remarque's new novel about exiles in Paris has been serialized in Collier's and has already been chosen as a "Book of the Month" selection. Hauser's *The German talks back*, a superficial political analysis of an ex-pro-Nazi, has been a highly questionable venture of author and publisher (Holt). Some sophisticated literary excitement has been provoked by the simultaneous German and English editions of Hermann Broch's new novel, *Virgil's Death* (Der Tod des Vergil). The publisher, Pantheon (the former Kurt Wolff Verlag), has shown distinctive taste and publishing instinct in a great number of European literary

and art works hitherto unknown to the American reader. In a related field, W. W. Norton continued his valuable publication of R. M. Rilke's work. F. Hayek, a former Viennese economist, has caused quite a stir in this country with his conservative-liberalistic, anti-socialistic study *The Road to Serfdom*.

A few experimental publishers of German books have sprung up in New York, Los Angeles, Mexico, Chile and Argentina, such as O. M. Graf, *Der Quasterl* (five short stories); New York, Aurora: F. C. Weiskopf, an anthology, *Die Unbesiegbaren* (The Invincibles); Ernst Bloch, *Freiheit und Ordnung* (Freedom and Order), outline of social utopias; F. Bruckner, *Simon Bolivar* a play; New York, F. Krause: J. Urzidil's *Der Trauermantel* (Coat of Grief); K. O. Paetel, a book about the German poet E. Jünger; Walter H. Perl, an essay on Thomas Mann. In Los Angeles, Werfel published *Die schönsten Gedichte*; in Mexico: Paul Mayer brought out *Exil* (Poems); P. Merker: *Germany—to be or not to be*; L. Renn: *Adel im Untergang* (Aristocracy in Decline). In Buenos Aires: Doris Dauber, *Eine Nacht ein Leben* (A night a life); C. A. Friedenreich, *Richard Wagner*; A. Siemsen, *The Tragedy of Germany*.

Effort has been devoted to reprints of popular German literature: In Stockholm Bermann-Fischer has republished most of the works of Werfel, Stefan Zweig, Thomas Mann, Hugo von Hoffmannsthal. In this country there have been new editions of dictionaries (Langenscheidt, Cassell), Ganghofer, Erich Kaestner, W. Busch, Rilke, anthologies of German poetry, and a number of highly specialized scientific works which were important to the war effort. Of B. Fischer's German pocket-book editions, for German prisoners of war in American prison camps, twenty-four volumes were published and immediately sold out (among them St. V. Benet, *America*; Wendell Willkie, *One World*; Hemingway, Werfel, Conrad, L. Frank, Th. Mann, Remarque, Heine, Saroyan).

Some mention should be made of a peculiar literary-legal situation that has arisen. According to U. S. law, American copyright is not granted to original works by American authors, printed outside of the U. S. Since many German writers are now American citizens, their original German editions would not be protected if first published in a foreign country. Attempts are being made to modify this legislation.

MARTIN GUMPERT.

GERMANY. A former Federal republic of Central Europe, wholly occupied by Allied military forces for an indefinite period. It is divided into four zones of occupation: Russian (east), American (southwest), British (northwest), and French (west). The former capital, Berlin, is similarly divided into four zones of occupation.

Area and Population. As a result of the armistice of May 8, 1945, and of the Allies' declarations of June 5, announcing the assumption of joint control of Germany (see *Events*, below), the former Third Reich was reduced to its territorial limits of Dec. 31, 1937, before the annexation of Austria. This is an area of 181,688 square miles with a population of 69,459,825 on May 17, 1939. For the political subdivisions of Germany previous to its occupation by the Allies, and for the populations of the chief cities according to the census of May 17, 1939, see *YEAR BOOK* for 1944, p. 247.

Government. By virtue of the declarations of June 5, 1945, the Governments of the United States of America, the Union of Soviet Socialist

Republics and the United Kingdom, and the Provisional Government of the French Republic have assumed supreme authority in Germany in all fields and on all levels of administration. This authority is exercised by the Soviet, United States, British, and French commanders-in-chief each in his zone of occupation. Matters affecting Germany as a whole, within the limits of Dec. 31, 1937, are in the hands of a Control Council, composed of the four commanders-in-chief and their political advisers. The area of Greater Berlin is administered by an inter-allied governing authority (Kommandantur) consisting of the four local commandants and their technical staffs. As a result of the Potsdam (Berlin) Conference of July 17 to Aug. 2, 1945, a large area of eastern Germany formerly included in the Soviet zone of occupation was placed under Polish administration (see *Events*, below). For the governmental set-up in Germany prior to the surrender of that country see *YEAR BOOK* for 1944, p. 248.

The Nuremberg Trials. With the arrest of former Foreign Minister Joachim von Ribbentrop in June, all the top Nazi leaders were accounted for. Except for Hitler and Goebbels, presumed dead, Bormann missing but believed dead, and the suicide Himmler, they were all in custody of Allied authorities.

In August, Nuremberg was definitely selected as the scene of history's greatest war crimes trial and the arrested Nazi leaders, most of whom had been temporarily held at Mondorf-les-Bains in Luxembourg, were transferred to the Nuremberg city jail.

On Oct. 18 a formal indictment against twenty-four of Hitler's military and political lieutenants was presented before the International Military Tribunal set up by the Allies in Berlin, while copies of the indictment were served on the accused at the Nuremberg jail. The innumerable counts of the indictment were grouped under the four main headings of "The Common Plan or Conspiracy," "Crimes Against Peace," "War Crimes," and "Crimes Against Humanity."

The names of the accused were: Hermann Wilhelm Goering, Rudolf Hess, Joachim von Ribbentrop, Robert Ley, Wilhelm Keitel, Ernst Kaltenbrunner, Alfred Rosenberg, Hans Frank, Wilhelm Frick, Julius Streicher, Walther Funk, Hjalmar Schacht, Gustav Krupp von Bohlen und Halbach, Karl Doenitz, Erich Raeder, Baldur von Schirach, Fritz Sauckel, Alfred Jodl, Martin Bormann, Franz von Papen, Arthur Seyss-Inquart, Albert Speer, Constantin von Neurath, and Hans Fritzsche.

In addition, the prosecution requested that the entire Cabinet of Adolf Hitler, the leadership of the Nazi Party, the SS (Elite Guard), the SA (Storm Troops), the Gestapo, and the General Staff should be declared "criminal in purpose" by the Tribunal. If this were done, all individuals belonging to any of these organizations could in the future be dealt with as criminals without need for protracted trials.

The trial started on schedule, Nov. 20, after a last-minute postponement, motivated by various cases of illness both among the prosecutors and the accused, was averted.

Four of the defendants did not appear, however. They were Bormann, whose fate remained in doubt and who was tried in absentia; Ley, who committed suicide in his cell on Oct. 25; Krupp, desperately ill with softening of the brain; and Kaltenbrunner, stricken with cranial hemorrhage on the eve of the trial. A motion to eliminate Hess on mental grounds was rejected by the Tribunal (Hess later admitted that he had feigned amnesia.)

The judges selected by the four accusing powers were Francis Biddle for the United States, Sir Geoffrey Lawrence for Great Britain, Major-General I. T. Nikitchenko for Russia, and Henri Donnedieu de Vabre for France. Robert H. Jackson, Hartley W. Shawcross, Roman A. Rudenko and François de Menthon acted as chief prosecutors, respectively.

The prosecution's case was opened on Nov. 21 by Justice Jackson, the chief American prosecutor, against a general defense plea of "not guilty." The following weeks, up to the end of the year, were taken up entirely by the submission of the huge amount of documentary evidence amassed by the prosecution and presented in turn by the various national prosecutors. It bared, in ample detail, the long and sordid record of Nazi aggression. On Dec. 20 the court recessed for the holiday season, until Jan. 2.

Production. There are no statistics available yet on production in Germany under Allied occupation. From all indications it was still very low by the end of the year. The key to all industrial activity in Germany is coal. Mining operations in mid-summer 1945 were at an almost complete standstill. According to a report made by General Eisenhower on Aug. 20, the production of hard coal in the Western zones of occupation totaled 1,932,000 metric tons in July (1,315,000 in June). The same report disclosed that Germany's production of hard coal in the years 1938-1943 had been, on the average, 188,000,000 tons a year, of which 138,000,000 came from the British zone, 36,000,000 from the Eastern zone and 14,000,000 from the French zone. The coal output in the American zone was practically nil. For figures on production, foreign trade and finance under the Nazi regime, see *YEAR BOOK* for 1944, pp. 247-248.

Events, 1945. The year of total defeat and unconditional surrender opened almost auspiciously for the Nazis. In the west, the still undecided Battle of the Ardennes gave promise of at least delaying Gen. Eisenhower's all-out assault on the Reich; in the east, the long-expected Soviet winter offensive still was hanging fire; in the south, the Allies' slow drive up the shaft of the Italian boot had virtually been halted.

Better still for the Nazis, the Allies already were having plenty of trouble in the newly liberated countries. There was open discontent in France, rioting in Belgium, civil war in Greece, constant friction between Russia and the Western Powers. On the home front, too, the outlook was improving for the Germans. The news of Field Marshal von Rundstedt's initial success in the Ardennes counter-offensive once more had filled the nation with a momentary *Siegesrausch*, in which the glowing New Year proclamations of the Nazi leadership seemed to make sense. Rundstedt himself struck the key-note: "Confident and determined to the last, we cross the threshold of the year 1945. Our faith in the Fuehrer and in the united strength of our people is unshakeable. . . . We shall never flag, never give in until the enemy is beaten. Long live the Fuehrer!"

Hitler, long hidden from his wondering people, reappeared on the scene. Official news pictures showed him receiving foreign diplomats, conversing with his lieutenants and satellites, and inspecting the front. He was reported personally to have taken charge of operations in the east.

The Nutcracker Snaps. This seeming confidence and tranquillity did not last long. On January 12 the Red Army opened its long-delayed winter offensive in the crucial sector between Warsaw and

Cracow with shattering effect. Within a few days, five great army groups swung into action from the tip of East Prussia down to the mountains of Slovakia. A German military spokesman readily admitted that this was an offensive designed "not to gain ground, but to win the war." While the Russians punched one deep hole after another into the German lines, Gen. Eisenhower's armies liquidated the last remnants of the "Bulge" and prepared for the great breakthrough to the Rhine.

January 30—twelfth anniversary of Hitler's rise to power—saw the Junker strongholds of East Prussia and Upper Silesia in Russian hands, with other Red armies sweeping across Brandenburg and Pomerania toward the Oder and Berlin. In the face of impending disaster, Hitler—or a voice purporting to be his—broadcast a frantic appeal to the Germans to rally against the "horrible fate that is now taking shape in the east." Said the Fuehrer: "I expect every German to do his duty to the last. . . . I expect every able-bodied German to fight with complete disregard for his personal safety. . . . I expect the sick and the weak . . . to work with their last strength . . ."

Doomsday at Yalta. Even as military catastrophe drew near, a diplomatic disaster of comparable magnitude was shaping up for the Nazis. For a long time, their only reasoned hope of averting total defeat had lain in the chance that the Allied coalition might break under the many strains testing it. In the months since the Teheran Conference, signs of disunity among the Allies had cropped up in many places and Dr. Goebbels' agents worked overtime to foment and exacerbate dissension.

After many postponements, Roosevelt, Churchill, and Stalin, with their diplomatic and military staffs, met for the second time on February 4. The conference, which was held at the Black Sea resort of Yalta, lasted for a whole week and ended in substantial agreement on all major issues.

The Declaration of Yalta sealed Germany's doom. "It is our inflexible purpose," the Big Three announced, "to destroy German militarism and Nazism and to ensure that Germany will never again be able to disturb the peace of the world. We are determined to disarm and disband all German armed forces; break up for all time the German General Staff that has repeatedly contrived the resurgence of German militarism; remove or destroy all German military equipment; eliminate or control all German industry that could be used for military production; bring all war criminals to just and swift punishment and exact reparation in kind for the destruction wrought by the Germans; wipe out the Nazi Party, Nazi laws, organizations, and institutions, remove all Nazi and militarist influences from public office and from the cultural and economic life of the German people; and take in harmony such other measures in Germany as may be necessary to the future peace and safety of the world. It is not our purpose to destroy the people of Germany, but only when nazism and militarism have been extirpated will there be hope for a decent life for Germans, and a place for them in the comity of nations."

In this fair and statesmanlike resolution, a compromise was reached between the originally divergent conceptions of Russia and the Western Powers on how to deal with a defeated Germany. Stalin, who for many months had used rebellious elements of the German Army (banded together in the "Union of German Officers" in Moscow), gave up his plans to use their services also after the close of hostilities. Britain and America rallied,

at least in part, to the sterner Russian demands for the punishment of German war criminals, for the control of German industry, and for exacting reparations in kind, including the use of forced German labor for reconstruction work.

The Nazis greeted the decisions of Yalta with frenzied shouts of "mass murder" and terrible vows of vengeance, but they were unable to prevent their execution. Within a few days after the close of the conference, the western arm of the Allied nutcracker moved again, as Gen. Eisenhower launched four large armies toward the Rhine and the Ruhr basin. Simultaneously, the air war reached a furious climax. Day after day, Berlin, Leipzig, Dresden, Munich, and other German cities rocked under earth-shaking bombardments.

Disintegration. By early March, with Allied armies surging across the Rhine and the Oder for the knockout blow, signs of complete disintegration spread throughout Hitler's Reich. On March 17, the German-home radio reported that 1,000 officers and men of the German Army had been put to death by mobile courts-martial for desertion and other military offenses. Two days later, a drastic decree was issued, cancelling all leaves, calling up all men between the ages of 16 and 60 not yet in the armed forces, and threatening severe punishment of deserters, both military and civilian. Reports from the eastern front told of scores of bodies found hanging from gallows in captured towns, bearing labels such as these: "I was hanged because I did not fight well," or "I was hanged because I tried to leave too soon." The food situation worsened daily and there was a country-wide breakdown of transport and communication facilities.

With inescapable disaster staring in their faces, the Nazi leaders multiplied frantic appeals and dire threats, now occasionally mixed with apologies and attempts at self-justification. A message from Hitler, broadcast on the 25th anniversary of the announcement of the Nazi Party's program (February 24), still resounded with familiar boasts: "Twenty-five years ago I predicted the victory of our movement. Today, filled as always with belief in our nation, I predict final victory for the German race." A few weeks later, however, in a proclamation issued on "Heroes' Memorial Day" (March 11) the Fuehrer placed the emphasis on arguments in defense of his policy of rearmament and aggression, plainly in an attempt to silence the accusing voices that were beginning to make themselves heard even in Gestapo-ridden Germany.

In his turn, Dr. Joseph Goebbels, who, along with Heinrich Himmler and Martin Bormann, emerged as one of the strong men of Germany's dying days, filled the air with exhortations, blandishments and threats. But, toward the end of March, it became abundantly clear that Goebbels' once so efficient propaganda machine had lost its power, what with the steadily shrinking territory within its reach and ever spreading scepticism and despair.

The Death Throes. April was the month of agony and final convulsions. On April 5, *Das Schwarze Korps*, Himmler's organ, sombrely and accurately predicted that Germany was "only days or perhaps weeks from absolute collapse." The tragic death of President Roosevelt on the eve of Allied victory gave Nazi propagandists a temporary shot in the arm. Goebbels reiterated his favorite theme of Providential intervention: "The leader of the enemy coalition has been struck down by that very fate which kept our Fuehrer alive on July 20, 1944,

amid dead, wounded, and ruins so that he might complete his work." Hitler himself, in a final fling of spitefulness, declared in an order of the day that "fate has taken the greatest war criminal of all times from this earth."

As the fall of Berlin neared, and a link-up between the rampaging Russian and American-British armies in the heart of Germany appeared imminent, long-standing preparations for a last-ditch stand in the "National Redoubt" of Southern Germany were rushed to completion. On April 16, Japanese and other diplomats accredited in Berlin were moved to Bad Gastein, Austria, which had been selected as the temporary seat of the Nazi government. Archives and valuables also were evacuated to various hiding places within the Alpine "redoubt" area. The wives of prominent Nazi leaders sought refuge there, too, and in many cases they were accompanied by their husbands, who were supposed to be manning the barricades. Even before this exodus toward Southern Bavaria and Austria reached its peak, a Hitler decree, issued April 7, laid the foundation for continued underground resistance in Allied-occupied portions of the country by ostensibly divorcing Nazi Party leadership and civil administration. The decree stipulated that "all Party and State functions on the Kreis (county) level, where they are held by the same person, shall be separated." This move was a follow-up to the official sanction given, a few days earlier (April 1st), to the so-called "werewolves' organization," whose purpose it was to wreak individual vengeance upon renegades and traitors to the Nazi cause. The "werewolves" did assassinate a few mayors appointed by the Americans in the Rhineland, but on the whole their performance fell far short of what the Nazi leadership had expected from them.

While most of Germany's professional military leaders realized, in April, that the war was irrevocably lost, the extremists of the Nazi Party, especially men like Himmler, Goebbels, Bormann, and Robert Ley, leader of the Labor Front, preferred national suicide to surrender. Their hopes of prolonging the struggle for many more months, or even years, were based on (a) the existence of the naturally inaccessible, and strongly fortified, "Alpine Redoubt," matched in the north by "Mountain Fortress Norway"; (b) the fact that the advancing Allied armies had left in their rear more than a dozen Nazi "islands of resistance," some of them, like the Latvian pocket, still held by strong German forces, while others, the French Channel and Atlantic ports in particular, had proved capable of sustaining a long siege by superior forces; and (c) the campaign of terrorism, planned by the "werewolves," which, the Nazi leaders hoped, would prevent the local population, everywhere in the Reich, from submitting to Allied rule. That these elaborate plans completely failed to materialize, after all, is primarily due to the fact that the man to whom Germany for twelve years had blindly entrusted her fate, Adolf Hitler, lost heart in the supreme hour of crisis.

Finale in Berlin. The mystery of Hitler's death, if real, has not yet been fully cleared up, and indeed may never be. While the British authorities, and high American officials as well, have accepted the fact, if not the alleged circumstances, of Hitler's death in the ruins of Berlin, Russian scepticism persists. In the latter part of 1945, in particular, rumors that the ex-Fuehrer is still alive and at large cropped up repeatedly, though none of them could be substantiated.

Undisputed is the fact that Hitler, instead of

retreating with his government into the "Alpine Redoubt," decided personally to lead the defense of Berlin and to hold out there as long as possible.

Soviet spearheads, after a spectacular night attack by 4,000 tanks and almost 5,000 airplanes striking across the Oder in the white glare of massed searchlights, reached the outskirts of the Nazi capital on April 19, the eve of Hitler's 56th birthday, and two days later entered the city proper.

There, in the elaborate "Fuehrerbunker," dug deep underground beneath the Reich Chancellory, one of history's greatest dramas was enacted in the last ten days of April.

At the afternoon military conference, on April 20, General of the Army Krebs, the officer in charge of the defense of Berlin, reported that the city's position had become critical. It was decided, then, to evacuate all non-essential personnel and reduce the military staffs at the Chancellory and the High Command to skeleton strength. Disregarding the urgent advice of his entourage, Hitler insisted on staying, but two of his principal lieutenants, Himmler and Goering, hurriedly left that night for safer parts. The former went to his military headquarters in northwestern Germany, the latter fled into the "National Redoubt." Goebbels and Martin Bormann, the Fuehrer's Deputy, stayed.

On the 21st, Russian heavy guns began to shell the Wilhelmstrasse with devastating effect. By noon, the following day, Soviet vanguards were converging from several sides toward the center of Berlin. In the Fuehrerbunker, almost uninterrupted conferences were held. The decisive meeting took place in the late afternoon of April 22. The Chief of the High Command, Field Marshal Wilhelm Keitel, and his Chief of Staff, Col. Gen. Alfred Jodl, joined Bormann and the other political advisers in urgent pleas to the Fuehrer to leave while some avenues of escape still were open. All their insistence was to no avail, however. Hitler, physically and mentally ill, had made up his mind to die by his own hand rather than risk eventual capture in the mountains. His decision apparently was strongly influenced by the morbid desire of his mistress Eva Braun to die with him in a suicidal pact preceded by a last-minute wedding.

Following the April 22 conference, which marked the beginning of the end for Hitler, Keitel and Jodl also left Berlin, the latter with the remark: "I won't remain in this mousehole. Here you cannot work or fight or operate." Only the Fuehrer's "family circle" stayed behind along with Goebbels and Bormann. A last attempt to persuade Hitler to leave was made by the Minister of Armaments, Prof. Albert Speer, on April 23, but it also failed.

Meanwhile, Himmler, at his northern headquarters, had decided to dissociate his fate from that of his doomed Fuehrer. Through the intermediary of Count Folke Bernadotte of Sweden, whom he met secretly at Luebeck, on April 24, he forwarded a conditional surrender offer to the Allies, which did not include the Russians. Himmler immediately was informed that only unconditional surrender on all fronts would be acceptable. During his talks with Count Bernadotte, Himmler ventured the information that Hitler was so ill he might already be dead and that he could not live more than two days.

On the afternoon of April 25, American troops of the Twelfth Army Group joined forces, near Torgau in Central Germany, with advance elements of the First Ukrainian Army Group. Thus

the territory still controlled by the Nazis was effectively cut in two. At the same time, Berlin was completely encircled by two Russian armies joining northwest of Potsdam.

By April 29, when Soviet tanks broke through to the immediate vicinity of the Reich Chancellory, all hope of relief for the inmates of the "Fuehrerbunker" had vanished. That night, Hitler and Eva Braun were married in the conference room of the bunker. Not many hours later—apparently in the early afternoon of April 30, the newlywed couple committed suicide, Hitler by shooting himself, the woman by taking poison. After their suicide, the bodies were soaked with petrol and set afire in a garden just outside the bunker. Whether they were consumed by the flames, or the remains were buried, is not known.

The foregoing account is based primarily on the findings of British intelligence officers who interviewed members of Hitler's personal staff captured after Germany's collapse. An official statement declaring that the suicide of Hitler and Eva Braun had been established "as conclusively as possible without bodies" was released by the Allied Control Council, British Echelon, on Nov. 1. As far as can be ascertained, the investigations conducted by American intelligence officers arrived by and large at the same conclusions. Russian scepticism, however, has not yet been dispelled. While the Soviet authorities have accepted the story of Hitler's marriage at the climactic moment of the Battle of Berlin—indeed the first news of this peculiar event was given out, at a press conference on June 9, by Marshal Gregory K. Zhukoff—they have steadfastly maintained that the pair still could have escaped by air and that, at any rate, there was no positive evidence of Hitler's death. Zhukoff's assistant, Col. Gen. Nikolai E. Berzarin, stated on the same occasion: "My personal opinion is that he (Hitler) has disappeared somewhere into Europe. Perhaps he is in Spain with Franco. He had the possibility of taking off and getting away." This Russian view, often repeated in the press since, was in no way altered by the above-cited British statement.

Whatever the truth about Hitler's disappearance from the political scene at the end of April, it is quite certain that the official version given out by the Germans was untrue. On May 1, Admiral Karl Doenitz, Commander-in-chief of the German Navy, in a highly melodramatic broadcast over the North German radio network, announced that Hitler had died "a hero's death" fighting to his last breath against the Bolsheviks. According to the broadcast, the Fuehrer "fell for Germany" on the afternoon of May 1, after having appointed Doenitz as his successor.

Collapse and Surrender. For a few days, the new Fuehrer, Admiral Doenitz, sought to continue the hopeless struggle, in an obvious attempt to split the Allies by fighting against the Russians alone. The trick, already attempted by Himmler, again failed to work. Allied armies, both from the east and west, continued to slash deeper into the tottering Reich. Munich fell on April 30, Berlin on May 2. In many places revolt broke out causing important strategic points to be taken without resistance.

The first mass surrender of the beaten German Army took place on April 29 at Caserta, Italy, but it was not announced until May 2. Preceded by lengthy secret negotiations between OSS agents and representatives of Elite Guard General Karl Wolff, the German plenipotentiary in Italy, the capitulation involved nearly one million Nazi troops in Northern Italy and Southern Austria. It threw

the southern gates to the "National Redoubt" wide open to the Allies and spread confusion and demoralization among the German troops still holding out on other fronts.

Nevertheless, for a few days the possibility of a desperate German stand in the Scandinavian countries and Holland persisted. Even as the Germans in Italy laid down their arms, the Nazi commissioners and commanders in Denmark, Norway, the Netherlands, Bohemia, and elsewhere pledged their allegiance to Doenitz and promised to continue the fight. Signs of disunity, however, spread to all parts of Hitler's one-time empire and German resistance simply melted away in the face of rapid Allied advances.

On May 4, all German forces in Holland, Denmark and Northern Germany gave up to British Field Marshal Sir Bernard L. Montgomery, and the following day Doenitz admitted in a radio broadcast that "the struggle against the Western Powers has become senseless." However, neither the new Fuehrer, nor his Foreign Minister, Count Lutz Schwerin von Krosigk (who had replaced von Ribbentrop on May 1), were ready yet to capitulate to the Russians. In a last, desperate attempt to divide the Allies, the Nazi leaders even ordered troops facing the Soviet armies to turn around and surrender to the Anglo-American forces instead.

It was not until virtually all of Germany had been occupied, with the exception of a few isolated pockets in the north and southeast, that these maneuvers were abandoned. On May 5 an armistice delegation headed by Gen. Admiral Hans Georg Friedeburg, the new commander of the German Navy, arrived at Gen. Eisenhower's headquarters at Reims for preliminary talks. Once again, Friedeburg attempted to exclude the Russians from the parley but he was told immediately that Gen. Eisenhower would not talk about anything but unconditional surrender to all the Allies. As he did not carry credentials from Doenitz authorizing him to sign an act of capitulation, the admiral was instructed either to obtain such powers from his government or to request the immediate dispatch of other delegates empowered to sign. In compliance with this virtual ultimatum, Doenitz sent his chief of staff, Col. Gen. Alfred Jodl, who arrived at Reims by air on the morning of May 6, accompanied by his aide, Major Wilhelm Oxenius.

For almost twenty-four hours, the unhappy German emissaries—Admiral Friedeburg, in particular, displayed vivid emotion—argued and haggled about each point of the surrender document they were requested to sign. Repeatedly they consulted Doenitz by long-distance telephone. Finally, at 2:41 A.M. on May 7, 1945, (European time), the document was signed by Gen. Jodl on behalf of the German High Command, and by Lt. Gen. Walter Bedell Smith for the Supreme Allied Commander. A French and a Russian general also affixed their signatures.

In spite of the fact that the Reims surrender document bore the signature of Gen. Ivan Susloparoff on behalf of the Soviet High Command, Moscow was not fully satisfied with the procedure and it was agreed that a formal ratification of the surrender should take place at Berlin. There, on May 9, at 12:15 A.M. European time, the Chief of the German High Command, Field Marshal Wilhelm Keitel, affixed his signature to a new Act of Surrender identical with the Reims document except for a few additions defining more closely the details of the surrender of German troops. The ceremony took place at the headquarters of Soviet Marshal Gregory K. Zhukoff in the suburb of Karlshorst.

The official end of the war in Europe was set at midnight, European time, May 9 (6:00 P.M., Eastern War Time on May 8), when the cease fire order went into effect. However, some German Army units, especially in Bohemia and Yugoslavia, continued hostilities in open defiance of the surrender terms. It was not until May 15 that the last Soviet communiqué was issued, announcing that "the reception of surrendered German officers and men on all fronts has been concluded."

Flensburg Interlude. Although his authority originated from no better source than the supposed last will of the supposedly dead dictator Hitler, Admiral Doenitz made an overt bid to retain power even after total defeat and surrender. In a broadcast over the Flensburg radio, on May 8, he declared: "The foundation on which the German Empire was built is a thing of the past. The unity of State and Party no longer exists. The Party has disappeared from the scene of its former activity. With the occupation of Germany power has passed into the hands of the occupation forces. It depends on them whether I and the government formed by me will be able to continue in office . . ."

The Allies neither confirmed Doenitz and his skeleton Cabinet in their posts, nor did they immediately proceed to oust them. For a few weeks, despite mounting criticism by the Russian press in particular, Doenitz' shadow government was permitted to function in comparative freedom at improvised headquarters at Flensburg near the German-Danish border. It was officially explained that this tolerance was motivated by a desire to control and administer the then still considerable German forces pending their demobilization.

In the meantime, a comprehensive man-hunt for Nazi leaders and war criminals was set in motion throughout occupied Germany and the liberated countries. It netted, within a few days, some of the biggest names on the Allies' long-standing "Wanted" list.

First to fall into the hands of his pursuers was Reich Marshal Hermann Goering who was taken on May 9 in the vicinity of Salzburg. Next, on May 16, Robert Ley was picked up, also in the "National Redoubt" area. The notorious Jew-baiter Julius Streicher was arrested on May 23, appropriately by a Jewish officer. Late on the same day, an intensive search made by British authorities in the Bremen area led to the capture of the No. 2 Nazi criminal, Heinrich Himmler. A few hours after his arrest, the Gestapo chief managed to swallow poison by biting open a tiny phial concealed in his mouth; he died almost instantly in spite of strenuous efforts to revive him. A large number of former Cabinet ministers, Gauleiters, and Nazi Party officials also were seized during that period. Of high-ranking military men, Field Marshal Keitel was placed under arrest on May 15; Field Marshal Albert Kesselring, the last West Front commander, had surrendered a few days earlier in Austria.

With most prominent Nazi leaders reputed dead or in prison, and German forces everywhere under control, the last step in the liquidation of the Third Reich was taken on May 23 when British military police arrested Doenitz, Jodl, Schwerin von Krosigk and other members of the shadow government at Flensburg. The transitional regime instituted by Doenitz after Hitler's death was dissolved.

AMG Takes Over. The occupation and administration of conquered Germany had been planned long beforehand in the councils of the Big Three and in inter-Allied commissions of experts. Yet, when the moment arrived and the immediate necessity arose of substituting Allied Military Gov-

ernment for the ousted Nazi authorities, there were many unforeseen problems and difficulties.

For one thing, the chaos and destruction left behind by the Nazis in what used to be the heart of the European Continent far exceeded even the most pessimistic forecasts. For another, the collapse of the Hitlerian regime came more suddenly than had been expected. Finally, the fundamental differences in the occupation policies of the Big Three had been smoothed over rather than settled at Teheran and Yalta.

The first step for each of the three conquering powers was to set up, in its respective zone of military operations, a provisional administration patterned after its own principles and designs. Thus, by the time Germany surrendered all its territory and population, the Americans in the Rhineland and the Russians in Eastern Germany had already developed fairly well-organized forms of AMG, which—not unnaturally—differed widely from each other in many respects.

Thus, the first major problem confronting the Allies was that of coordinating their policies of occupation and regional administration, and another was to guard against encroachments of one upon another's territory and rights:

The territorial division of Germany into American, British, Russian,—and eventually a French,—zones of occupation had been agreed upon, in principle, at the Big Three meetings. When the Nazi collapse came, however, it appeared that the Russians, in some sectors, had not reached the limits of the zone assigned to them for occupation, and that the Americans, in particular, had been carried by the impetus of military advance farther than their political authority was to extend. This state of affairs for some time stymied efforts effectively to organize the joint control of Germany because the Russians insisted on prior withdrawal of the American forces from Thuringia and other areas assigned to Soviet control.

Formal assumption of control over the Reich by the victorious powers took place on June 5 by a series of declarations simultaneously issued in Washington, London, Moscow, and Paris.

Stating that "There is no central government or authority in Germany capable of accepting responsibility for the maintenance of order, the administration of the country and compliance with the requirements of the victorious powers," one of the four documents issued proclaimed: "The Governments of the United States of America, the Union of Soviet Socialist Republics, the United Kingdom, and the Provisional Government of the French Republic, hereby assume supreme authority with respect to Germany, including all the powers possessed by the German Government, the High Command, and any state, municipal or local government or authority . . ."

In another declaration, the Allied Powers formalized the division of Germany "within her frontiers as they were on Dec. 31, 1937," into four zones of occupation, viz, an eastern zone allotted to Russia, a northwestern zone to be controlled by Great Britain, an American-ruled southwestern zone, and a western zone reserved for the French. The final demarcation of these zones did not take place until mid-August, after the Americans had yielded a sizable area in Central Germany to the Russians, and British forces had taken over control of the northern part of the Rhineland and of the Ruhr district, previously occupied by U. S. troops. Under this arrangement, Russia, the United States, and Great Britain were allotted each about 40,000 square miles of German territory, while the French

had to be content with only about one-half of that area. The French were given a zone shaped like an hour-glass, on both sides of the Rhine, including the southern part of the Rhineland, the Saar, the Palatinate, most of Baden and the southern half of Wuerttemberg. The adjoining American sector comprised Bavaria, the northern part of Wuerttemberg (including Stuttgart), Hesse and Hesse-Nassau. The Russian zone embraced Mecklenburg, Saxony, Thuringia and Brandenburg (in addition to the provinces of East Prussia, Silesia, and Pomerania subsequently relinquished to Poland). The British took Schleswig-Holstein, Hanover, Hamburg, Bremen, Oldenburg, Brunswick, Westphalia, the northern Rhineland, and sundry small German states in that area.

A special arrangement was made with respect to Berlin. The ruined, but still populous, Reich capital was, in its turn, quartered into American, British, Russian, and French zones of occupation, enclosed on all sides by Russian-controlled territory. An Allied governing body (Kommandantur), consisting of four commandants was set up to administer this "Greater Berlin" area.

In the matter of occupation policy and coordination, one of the declarations released on June 5 stipulated that "supreme authority in Germany will be exercised, on instructions from their Governments, by the Soviet, British, United States and French commanders-in-chief, each in his own zone of occupation, and also jointly, in matters affecting Germany as a whole. The four commanders-in-chief will together constitute the Control Council. Each commander-in-chief will be assisted by a political adviser. The Control Council, whose decisions shall be unanimous, will ensure appropriate uniformity of action by the commanders-in-chief in their respective zones of occupation and will reach agreed decisions on the chief questions affecting Germany as a whole . . ."

After having thus established Allied authority over Germany, and the machinery for exercising it, the four powers, on June 5, imposed on the Reich a detailed armistice elaborating on the brief articles of unconditional surrender signed on May 7. It provided for the complete disarmament of all armed forces under German control, the evacuation of all territories outside the German frontiers of Dec. 31, 1937, the surrender of all aircraft, ships, war materials, war plants and equipment. Other provisions required Germany to surrender all Allied prisoners and all Nazi leaders and war criminals specified by the Allies. In another article, the Allied powers, mindful of the scuttling of the German fleet at Scapa Flow after the first World War, explicitly forbade the destruction, damaging, or transfer of military, naval, shipping or industrial material, or records or archives. Finally, it was announced that the Allies would take over all state, municipal, or local governments as well as the direction of all railways, transports, communications and radio services in the Reich. Article 14 put teeth into the document: "In the event of failure on the part of the German authorities or people promptly and completely to fulfill their obligations hereby or hereafter imposed, the Allied representatives will take whatever action may be deemed by them to be appropriate under the circumstances."

A special declaration issued in connection with the above informed the other United Nations of the assumption of supreme authority in Germany by the Big Four and promised that the Control Council would consult them in the exercise of this authority.

The Control Council at Work. The first meeting of the four-man Control Council was held in Berlin on the day the above declarations were issued. It was attended by Gen. Dwight D. Eisenhower for the United States, Field Marshal Sir Bernard L. Montgomery for Great Britain, Marshal Gregory Zhukoff for Russia, and Maj. Gen. Jean de Latre for France. After this initial meeting, however, there was an interval of several weeks before the Council began to operate effectively, due to the above-mentioned Russian demand that the Americans should first withdraw from all territories allotted to the Soviet authorities of occupation.

Among the first tasks confronting the Council were those of preparing the entry of American, British, and French troops into Berlin and of confirming or changing the German administration set up in that city by its Russian conquerors.

On July 12, the Soviet authorities in Berlin formally turned over control of twelve of the city's twenty boroughs to American and British representatives; French participation in the occupation of Berlin was delayed by several weeks until August 13, but a French representative joined in the establishment of the four-power Kommandantur on July 11.

By common agreement, orders and regulations issued by the Russian military commander during the period of exclusive Soviet control of Berlin remained in force unless and until explicitly altered by the Control Council or the Kommandantur. The personnel of the first city administration set up by the Russians under Lord Mayor Arthur Werner also was continued in office but on August 2 the Food Controller, Dr. Andreas Hermes, was dismissed on charges of inefficiency. In the following weeks and months, a considerable measure of coordination was achieved in the four-power control of the former German capital. Concerted drives on the flourishing black market were organized and a common approach to the ticklish question of "fraternization" was worked out. However, in spite of the steady tendency toward uniform and centralized rule of Berlin, certain differences in policy persisted, especially in such matters as control of the press, leading to diverse regulations in various parts of the city.

The Potsdam Conference. On July 17, the President of the United States, Harry S. Truman, the Prime Minister of Great Britain, Winston S. Churchill, and the Soviet Premier Joseph V. Stalin met at Cecilienhof Palace near Potsdam for the third "Big Three" meeting of the war. At the close of the Conference, on August 2, a communiqué was issued which, among other matters of importance, dealt with the future fate of Germany.

Perhaps the most momentous decision of the Potsdam Conference in regard to Germany was that it virtually stripped the Reich of its eastern provinces. Although the three heads of government agreed that the final determination of boundaries should be left for the peace settlement, they decided that, in the meantime, all former German territories east of a line running from the Baltic Sea immediately west of Swinemünde, and thence along the Oder River to the confluence of the western Neisse River and along the western Neisse to the Czechoslovak frontier, should be turned over to Polish administration. This meant that, for all practical purposes, East Prussia (with the exception of Königsberg and an adjacent area which were placed under Soviet administration), Upper and Lower Silesia, the eastern half of Pomerania, and parts of Brandenburg Province became Polish.

Whether or not this had been agreed upon at

Potsdam, the Poles, in the following months, ejected virtually the entire German population—which, before the war, had been in an overwhelming majority in those provinces—from the annexed territories. Although the Potsdam Declaration had prescribed the transfer of German populations in Eastern Europe "in an orderly and humane manner," millions of Germans were driven from their homes east of the Oder and dumped into overcrowded and largely devastated areas of Central and Western Germany. This mass expulsion, which greatly aggravated the already pressing difficulties of nutrition and hygiene in the occupied Reich, caused repeated and vigorous protests in the British House of Commons and elsewhere, but from all indications it was carried out with at least the tacit approval of the Soviet Union.

In the matter of reparations, the Potsdam Conference decided that Germany should be compelled "to compensate to the greatest possible extent for the loss and suffering she has caused to the United Nations and for which the German people cannot escape responsibility." It was agreed in principle that each occupying power would take reparations from its respective zone in Germany but, recognizing that the Soviet Union had suffered greater losses than any of the other major powers, provision was made for additional compensation for Russia from industrial equipment to be removed from the western zones of Germany.

Rigid measures of control were agreed upon to prevent German economic strength from ever becoming a menace again. In rebuilding the country's shattered economic system, the Potsdam Declaration stated that "primary emphasis shall be given to the development of agriculture and peaceful domestic industries," and "the German economy shall be decentralized for the purpose of eliminating the present excessive concentration of economic power as exemplified in particular by cartels, syndicates, trusts and other monopolistic arrangements."

In the political field, the Allied leaders agreed that Germany should be completely disarmed and demilitarized; that the Nazi Party and all its institutions should be uprooted; that all war criminals should be brought to justice and all other Nazi leaders interned; that German education should be so controlled "as completely to eliminate Nazi and militarist doctrines and to make possible the successful development of democratic ideas"; that democratic political parties should be allowed and self-government "on democratic principles" should be restored throughout Germany; and that, subject to military security, freedom of speech, press, and religion should be permitted.

The Potsdam Declaration gave an authoritative reply to many controversial questions regarding the future of Germany. It settled the issue between advocates of a "hard" and those of a "soft" peace, preponderantly in favor of the former. It gave clear notice that for some time to come there would be no central German government, but that the country, during the period of occupation, would be treated as a single economic unit. It warned the German people "that they have suffered a total military defeat and that they cannot escape responsibility for what they have brought upon themselves . . ." but also held out hope by telling the Germans "to prepare for the eventual reconstruction of their life on a democratic and peaceful basis."

Remaking Germany. The principles and purposes of the Potsdam Declaration were translated, in the following months, into a series of important decrees

by the Allied Control Council as well as by the individual commanders-in-chief, each for his zone.

On August 6 Gen. Eisenhower and Field Marshal Montgomery, in simultaneous announcements, warned the Germans that they would be faced with serious shortages of food, fuel, housing and transport in the winter ahead. The Germans were advised to cut wood as a substitute for coal, which would not be available at all in private homes, and to speed up repairs of bomb-damaged houses. The two commanders also declared that law and order had been restored in Germany and they promised their assistance in the rebuilding of German life on a "democratic" basis and on "true, liberal" principles. Henceforth, they declared, local political activities and the forming of local trade unions would be permitted, "subject to the approval of the local military government."

The Allied Control Council, on Sept. 20, lifted all restrictions on "fraternization" between Allied soldiers and Germans, but the right to control marriages and billeting with German families was reserved to the individual commanders. The following day, Gen. Eisenhower declared that the ban on marriages between American military personnel and Germans would continue in force.

A 48-point proclamation issued by the Control Council on Sept. 25 formally abolished all German armed forces, Nazi organizations, war veterans' associations and other bodies designed "to keep alive the military tradition in Germany." The Hitler party was "finally abolished and declared to be illegal." The Council also abolished the German diplomatic corps and assumed control of all matters affecting Germany's relations abroad.

Another decree, published on Oct. 22, restored the equality of all persons before the law, abolished all "people's tribunals" and "special courts" instituted under the Nazi regime, and put an end to the arbitrary principles of jurisprudence applied by Nazi judges.

The complex task of controlling and dismantling the highly centralized German industrial structure was begun in October after it had been revealed that despite incessant bombing and battle damages fully 75 percent of Germany's industries survived intact or in repairable condition.

On Oct. 12 it was announced in Berlin that the entire holdings of the huge I. G. Farben Trust had been confiscated and that many of the 300 plants owned by the concern would be either destroyed or dismantled for reparation purposes. First to be blown up, a few weeks later, were three of the Trust's ammunition plants in the American zone. On Nov. 16, the Krupp armament concern, whose plants are situated mostly in the British zone, was similarly confiscated by Montgomery. At the same time, the Russians announced the expropriation of Friedrich Flick's vast industrial holdings in Saxony. Russia also let it be known that she desired removal to the U.S.S.R. of all the machinery and equipment of the Opel Motor Works (partly owned by General Motors), as part of her share of reparations to be drawn from Western Germany.

German assets abroad, especially in neutral countries, were marshalled by an ordinance of the Council made public on Nov. 4.

Housecleaning in Bavaria. In the first few months following Germany's surrender, there developed, in the American zone of occupation, a serious divergence of opinions among Military Government officials on the question of "denazifying" Germany. The rift was especially marked in the Eastern Military District (Bavaria), where Gen.

George S. Patton, commander of the Third Army, ruled supreme as military and civil governor. Patton, from the start, inclined toward those who argued that it was more important to get the German economic system and administrative machinery running again than to push the purge of Nazis and militarists.

In keeping with this attitude of their chief, AMG officers in Bavaria allowed many known Nazis or Nazi sympathizers to remain unmolested for months, or even to keep important posts in the administration and in business.

On May 28, Col. Charles E. Keegan, Patton's chief executive officer, appointed Friedrich Schaeffer, a member of the conservative and clerical Bavarian People's Party, as Minister-President (Premier) of Bavaria. In the selection of his Cabinet, Schaeffer, besides heavily favoring his own party, included a number of former Nazis, such as the Minister of Finance Ernst Fischer. The Lord Mayor of Munich, Karl Scharnagl, likewise permitted the infiltration of Nazi sympathizers into the new city administration. As chief of police, Keegan appointed a man whose record included active participation in Hitler's Beer Hall Putsch of 1923: Colonel Hans von Seisser.

Keen disappointment in Bavarian anti-Nazi circles, and the growing arrogance of former Nazis, who instead of being in jail were found strutting about government offices in Munich, attracted the attention of American correspondents in that city. The situation developed into a real scandal which produced strong reverberations in America.

Following the recall of Col. Keegan late in July, a purge of the Bavarian civil administration was begun but proceeded slowly. Ernst Fischer was dismissed in August, along with several other members of Schaeffer's Cabinet. On August 21, Seisser was replaced by Michael von Godin, a staunch anti-Nazi and former police official who had also taken part in the Beer Hall Putsch, but on the opposite side: he had ordered his men to fire on the rebels led by Hitler.

However, the controversy between AMG officials went on and the purge of Nazis continued to lag even after Gen. Eisenhower, at a conference at his headquarters in Frankfurt-on-Main on August 27, had demanded the prompt and ruthless elimination of Nazism and militarism, in accordance with the Potsdam Declaration. As late as Sept. 19, a leading correspondent of the *New York Times* reported: "An unofficial survey of conditions in a score or more of German industrial towns and cities indicates that while the purge of important Nazis has been proceeding slowly in the political structure of the conquered country, there is a general tendency, with a few notable exceptions, to ignore, evade, or circumvent Gen. Dwight D. Eisenhower's explicit order of July 20 to permit German industry and business to resume operations only after ousting Nazi Party members from positions of management and direction."

The situation came to a head on Sept. 22, when Patton in an interview with three American correspondents expressed the opinion that the whole issue of nazism vs. non-nazism was comparable to a Democratic-Republican election fight. This, and other similarly unfortunate remarks, caused such a storm of editorial criticism in the American press that Patton, three days later, attempted to justify himself in a second interview, altering his stand considerably. But it was already too late. Called urgently to Gen. Eisenhower's headquarters, Patton was relieved of his duties as military governor of Bavaria.

A few days before Patton's transfer to a "paper command" was announced on Oct. 2, a real house-cleaning got under way in Bavaria on direct orders from Eisenhower. Minister-President Schaeffer and his entire Cabinet were dismissed and a Social-Democrat and tested anti-Nazi, Dr. Wilhelm Hoegner, was entrusted instead with the task of forming a new government; he selected four Social-Democrats, one Communist, and two Liberals as his ministers.

The Patton incident had far-reaching repercussions not only in Bavaria, where his successor, Lt. Gen. Lucian K. Truscott Jr., proceeded fully to carry out Eisenhower's instructions, but also in the other administrative units of the American Zone, especially Wuerttemberg, and in the British zone. There, two high officials who had been appointed by the Americans in the first phase of the occupation, Dr. Hans Fuchs, provincial head of the northern Rhineland, and Mayor Konrad Adenauer of Cologne, were removed by the British early in October. In Berlin, Prof. Ferdinand Sauerbruch, health commissioner in the city government, was dismissed on Oct. 11. Large-scale arrests of Nazi-minded industrialists and financiers also were carried out in October and November in the American and British zones.

On Oct. 12 Gen. Eisenhower, declaring that "any man in my army who I learn is not executing our policies with his heart, as well as his head and hands, will be placed in a job where he won't need to use his heart," reiterated his determination to "uproot nazism in every shape and form." He also announced that Nazis would be excluded from the polls in the local and provincial elections planned for the early months of 1946.

Eisenhower's Accounting. In a series of monthly reports, published, respectively, on Sept. 29, Oct. 16, Oct. 31, and Nov. 29, Gen. Eisenhower rendered a detailed account of his administration to the Joint Chiefs of Staff in Washington.

In his first report, covering the month of July, the general reported, among other things, that 80,000 Nazis in the mandatory-arrest category had been detained and that some 70,000 others had been removed from office. He also pointed out that Germany was bankrupt economically and intellectually and threatened by inflation.

The second report, covering the month of August, again stressed the lack of balance in Germany's economy, with the gross national production at less than 25 percent of its wartime level and purchasing power far in excess of available goods. The general outlined a 3-point anti-inflation program based on rigid price controls, the rapid restoration of production facilities to the levels authorized at Potsdam, and deflationary fiscal measures. Eisenhower also expressed his conviction that "a fair and impartially supervised election in Berlin would not support the present Communist party dominance of posts."

In his third report, Eisenhower called attention to the Germans' increasingly violent reaction to the preferential treatment given displaced persons and to the fraternization of German girls with Allied soldiers, as well as to other signs of growing unrest. He noted that the Germans also were getting "bolder in their criticism of the government," and warned that organized uprisings against the occupation forces might occur if widespread unemployment persisted.

Eisenhower's fourth and last report, covering October and the early part of November, was issued shortly after his appointment as Chief of Staff of the Army. Highlight of the report was the

blunt charge—also made by other high U. S. officials returning from Germany—that the administration of the Reich as an economic unit, as provided in the Potsdam Protocols, was being obstructed by the French. A proposed law to authorize the formation of trade unions on a national basis also had been foiled by French opposition, he revealed.

On Nov. 27, General Joseph T. McNarney, who a week earlier had succeeded Eisenhower as commander-in-chief of the U. S. forces of occupation in Germany, and American representative on the Control Council, predicted that the occupation would last ten years or more. He added, however, that the administration of Germany would be turned over to Allied civil authorities not later than June 1, 1946.

JOACHIM JOESTEN.

GOLD. Revocation by the War Production Board of its order L-208, effective July 1, 1945, allowed gold mines of the United States to resume unlimited production for the first time since Oct. 8, 1942, when the order went into effect. Necessity for rehabilitation of workings, shortage of labor, and lack of machinery and materials slowed the return of most mines to production, however, and total production figures for the year showed a drop from the previous record low of 998,394 fine oz. (revised) set in 1944. Production for 1945 was about 967,500.

From the time the mining ban was lifted until the end of the Japanese war, mines were haltered by Federal manpower restrictions channeling available labor to essential industry. Machinery and materials likewise went to metal mining essential to the war, while it lasted, and to industrial reconversion.

Gold production, as in previous war years, was largely a by-product of ores containing such essential war minerals as copper, lead, zinc, and tungsten. Utah Copper Co., whose copper mining operations were the largest in the United States, likewise was again the country's leading gold producer, and Utah topped the list of producing states. California, Nevada, Colorado and Arizona followed. In the latter part of the year, Alaska, California and South Dakota, which produce principally from straight gold ores and gravels, showed sharp gains.

The status of gold as a monetary base received further stability through passage by Congress of legislation providing for United States participation in an international bank and stabilization fund as provided by the Bretton Woods Conference. As passed, the agreement provides for defining currency par values in terms of gold or U. S. dollars.

Among world producers, the United States was third, being led by South Africa with an estimated 12,200,000 fine oz. and Canada with an estimated 2,600,000 fine oz.

CHARLES T. POST.

GOLF. A review of golf for the last season is a story of the feats of one Byron (Lord) Nelson, and the achievements of the popular ex-caddie were enough to fill a book or two. The 33-year-old Texas-born star, who had been acclaimed "Athlete of the Year" for his numerous record-making triumphs of 1944, soared to new heights in 1945.

Although midsummer found many of the sport's former top-notchers returned from the service and back on the links, this did not prevent Byron from gaining top ranking for the second year in a row.

With the ancient pastime enjoying a most successful season, the name of Nelson proved a magnet to the fans, for the tall Texan consistently turned in scores that might lead one to believe our present-day pros were competing on Tom Thumb courses.

When "Mr. Golf" walked off the icy Glen Garden course last December with a 273 (only 11 shots under par) he brought his year's earnings in War Bonds to \$86,528 and broke the record he had set the year before when he won \$46,600. His triumph in the Fort Worth open was all the more noteworthy because it came in his first competition after a two-month layoff.

It was little wonder then that the smiling Texan again was picked as our nation's leading male athlete of the year, the Associated Press poll giving him the No. 1 spot over such great performers as Doc Blanchard, Army's powerful All-America full-back, and Hal Newhouser of Detroit, baseball's outstanding pitcher.

The Toledo umbrella salesman won nineteen major P.G.A. tournaments in 1945—quite a feat when one considers that no pro ever had won more than six major tourneys in one season.

Byron repeated in the All-American open at Tam o' Shanter in Chicago with a 269, nineteen strokes better than his closest rival, for his fourth triumph in the tournament's five-year history, and also kept his title in the Victory open at Calumet. The P.G.A. championship, one of the few that had been eluding him, also fell his way when he conquered Sammy Byrd by a score of 4 and 3 in the final round. The former caddie also captured the Canadian open with a 280 and the Canadian P.G.A. test, shooting a record 268 in the latter.

Listed among his many other feats was a competitive 72-hole mark of 259 made in the Seattle open, that score clipping two strokes from the record made by little Ben Hogan, another Texan, only two weeks before. Nelson had established a standard of 263 in winning Atlanta's Iron Lung tournament earlier in the year. So it would seem this links wizard tolerates no poaching on his record grounds—if any rival breaks a record of his, Nelson comes right back and provides a tougher mark to shoot at.

Nelson was paired with Sammy Snead in a two-day match for the benefit of the P.G.A.'s Rehabilitation Fund for Wounded, and they divided honors, Nelson annexing the match play by 4 and 3 after the hard-hitting Virguman had won the medal play by 143 to 144 the day before.

Jug McSpaden of Sanford, Me.; Hogan, who rejoined the divot-diggers after a hitch in the service; Byrd, and Snead, who broke an arm in June, were among the other leading pros during the season.

Art Doering of Denver won the All-American test for amateurs, with women's laurels going to Lieut. Patty Berg of the Marines. Ellis Knowles of Apawamis and Mrs. S. H. Bird of Tamarack captured U.S. senior honors; Mrs. Estelle Lawson Page of Chapel Hill, N.C., annexed North-South laurels and Miss Kathleen Byrne of the Westchester Country Club won the New York State championship.

Mrs. Mildred Didrikson Zaharias of Los Angeles retained the Western open title, but lost her Western amateur crown to Miss Phyllis Otto of Atlantic, Iowa, and much to the surprise of many close observers of women's sports Mrs. Zaharias was picked in the Associated Press poll as the woman athlete of the year. Frank Strafaci of Shore View won the Metropolitan amateur title, with

the Metropolitan P.G.A. crown going to Clarence Doser of Scarsdale.

Ohio State triumphed in both the Western Conference and National Collegiate Association tournaments and Army was the leader in Eastern intercollegiate play.

THOMAS V. HANEY.

GRAZING SERVICE. A branch of the U.S. Department of the Interior, which administers grazing on 142,000,000 acres of Federal Range in order to protect the lands, permit the highest use of forage and other resources, and at the same time retard soil erosion and facilitate flood control. Director in 1945: Clarence L. Forsling.

GREAT BRITAIN. Official designation for the political union embracing England, Scotland, and Wales. Capital, London. Sovereign, George VI, who succeeded to the throne upon the abdication of Edward VIII on Dec. 10, 1936, and was proclaimed King on Dec. 12, 1936. Great Britain, together with Northern Ireland, the Isle of Man and the Channel Islands, forms the United Kingdom of Great Britain and Northern Ireland. For statistical purposes the Isle of Man, The Channel Islands, and in some cases Northern Ireland, are included under Great Britain. The area of Great Britain is 89,041 square miles. See BRITISH EMPIRE; IRELAND, NORTHERN.

Government. The United Kingdom of Great Britain and Northern Ireland is a limited monarchy with an unwritten constitution, under which final legislative, judicial, and administrative authority is vested in a Parliament of two houses, acting through a cabinet drawn from its members. The House of Commons consists of 640 members elected by universal suffrage on the basis of one member for every 70,000 of the population. The House of Lords has more than 800 members, including minors not seated. Seven new Labor peers were named in Oct. 1945.

Polling for the first general election since 1935 was held on July 5, 1945, and the results announced on July 26. In a marked swing to the left, Great Britain replaced its former Coalition (largely Conservative) Government under Winston Churchill with a Labor Government headed by Clement R. Attlee. The new standing of the Government parties in the House of Commons following this election is as follows: Labor, 393; Liberal, 10; I.L.P., 3; Communist, 2; Irish Nationalists, 2; Common Wealth, 1; Independent, 3. The Opposition consists of 198 Conservatives, 1 National, 13 Liberal Nationals and 1 Liberal.

Members of Attlee's cabinet, as of Aug. 25, 1945, were: Lord President of the Council, Herbert Morrison; Secretary of State for Foreign Affairs, Ernest Bevin; Lord Privy Seal, Arthur Greenwood; Chancellor of the Exchequer, Hugh Dalton; President of the Board of Trade, Sir Stafford Cripps; Lord Chancellor, Lord Jowitt; Secretary of State for the Home Department, James Chuter Ede; Secretary of State for Dominion Affairs, Viscount Addison; Secretary of State for India and Burma, F. W. Pethick-Lawrence; Secretary of State for the Colonies, George Henry Hall; First Lord of the Admiralty, Albert Victor Alexander; Secretary of State for War, John James Lawson; Secretary of State for Air, Viscount Stansgate; Secretary of State for Scotland, Joseph Westwood; Minister of Labour and National Service, George Alfred Isaacs; Minister of Education, Ellen Wilkinson; Minister of Health, Aneurin Bevan; Minister of Agriculture and Fisheries, Tom Williams.

Events, 1945. For Britain the year opened with rocket bombs causing 2,000 casualties a month and the Battle of the Bulge a source of deep anxiety. The 12 months ended with the country at peace; and although food and clothing were still scarce and living in general still austere, a new Labor Government, relatively young in years, was confident of seeing prosperity return before many more months should have passed.

Three-quarters of a million men and women in the services were war casualties, a third of them dead; 2,570 ships with a tonnage of more than 11,380,000 were gone. But when the end of the war with Germany came on May 8, Prime Minister Winston Churchill was able to say with truth that "neither the long years, nor the dangers, nor the fierce attacks of the enemy, have in any way weakened the independent resolve of the British nation," and to spur on his hearers to the prosecution of the war in the Pacific.

The new freedom was quickly used. On June 8 the King and Queen visited the freed Channel Islands, and on July 5 the King opened the Manx Parliament, the Tynwald, in a ceremony which can be traced back for more than a thousand years. The general election was held and the Churchill Government swept out of power by a Labor landslide. President Truman, returning from the Potsdam Conference on the treatment of defeated Germany, boarded H. M. S. *Renown* in Plymouth Harbor for luncheon with King George. Finally the surrender of Japan was a certainty, and the new Parliament took up its duties of reconstruction on August 15, the day after the capitulation.

Parliament under Churchill. The House of Commons under Churchill in the spring of the year clearly saw the approach of the war's end, the necessity of world organization and the tasks of internal reconstruction. When Churchill met with President Roosevelt and Marshal Stalin at Yalta in the first part of February the threat of the Battle of the Bulge was gone. Parliament, after a three-day debate on the Yalta Declaration, endorsed it unanimously on March 1.

Churchill was soon to refer to his meeting with Roosevelt at Yalta in sadder circumstances. April 17 was a day given over to services in memory of the late President. Churchill, in the House of Commons, spoke of his personal anxieties in the President's behalf at Yalta. The services at St. Paul's Cathedral were attended by the King and the members of the Royal Family, Queen Wilhelmina of The Netherlands, King Haakon of Norway, King George of Greece, King Peter of Yugoslavia, the President of Poland, and many other official persons and representatives.

After the surrender of Germany Churchill proposed that the Coalition Government should continue in office until after the end of the war in the Pacific, but Attlee rejected the proposal. Consequently, in order to force a general election, Churchill resigned on May 23. He was at once reappointed by the King as Prime Minister of a "caretaker" government to act through the period covering the dissolution of Parliament on June 15, the polling on July 5 and the announcement of the results on July 26.

The cabinet selected by Churchill to serve with him for the period retained the main strength of the predominating Conservative Party, together with leaders of the Liberal Nationals and industrialists who had been serving in the Government. Anthony Eden's work in the Foreign Office and Sir John Anderson's as Chancellor of the Exchequer was not interrupted. One of the few sur-

prises was the substitution of Richard Austen Butler for Ernest Bevin as Minister of Labor and National Service. There was little accent on youth but a good deal on the kind of team which could carry out the tasks of reconstruction if reelected.

On June 15 this Parliament, the 37th of the United Kingdom and the fourth longest, was dissolved. It had both made and survived history. In Churchill's words, the House of Commons of this Parliament had not only preserved the title deeds of democracy in perilous times, but also "proved itself the strongest foundation for waging war that has ever been seen in the whole of our long history." It developed the technique of submitting a broad outline of policy in White Papers and instituted many changes in harmony with the needs of the times, including the new Education Act. At the time of dissolution the Conservatives had 358 of the 615 seats, Labor 164 and Liberal Nationals 26.

General Election. The election campaign was a bitter one. Churchill's campaign speeches were unusually vigorous, and marked in particular by attacks upon Professor Harold Laski, chairman of the British Labor Party, and by vivid threats of a Gestapo rule if the Labor Party should win. *The Times* (London) remarked on June 5 that his presentation of the Socialist vs. individualist issue was artificial and that the country, which had had a Socialist Government once, was not really frightened of having one again. *The Economist* (London) said on July 7, when the polling was over, that "the Conservatives have resorted to stunts, red herrings, and unfair practices to an extent that has disgusted many of their friends and followers," and that "Mr. Churchill's harping on the Laski theme in the last few days before the poll was nothing but an unworthy stunt, as insulting to the intelligence of the electorate as it was to the patriotism of the Labor leaders."

Perhaps Churchill overplayed his hand. Or perhaps, as seems more likely, the electorate was convinced that the tasks of reconstruction needed different men and points of view from the tasks of war so successfully accomplished. At any rate, Labor won by a landslide. The party's representation of 164 in the former House of Commons was increased to 393, making it the strongest party of all, with an independent majority of 157 over all other parties and groups combined. The Conservative Party's strength was reduced from 358 to 198. Little was left of the ministers in the former government, for 32 of them lost their seats. Liberal Nationals (13) and Liberals (11) almost vanished from the British political scene. None of the minor parties got more than 3 seats.

Churchill at once drove to Buckingham Palace and tendered his resignation as Prime Minister. Very soon after he left, Attlee arrived at the Palace and accepted the King's invitation to form a ministry. Major Clement R. Attlee did not work up from the ranks, but via Haileybury School, University College (Oxford), the law, a lectureship at the London School of Economics, and distinguished service in World War I. But his cabinet Ministers included Herbert Morrison, son of a London policeman, as Lord President of the Council, Ernest Bevin, odd job boy, as Foreign Secretary, and Walter J. Edwards, former Royal Navy stoker, as Civil Lord of the Admiralty.

Empire and Foreign Policy. The Churchill Government left to Attlee and his ministers a considerable legacy in Empire, colonial, and foreign policy, sufficiently difficult of solution even before the use of the atomic bomb and the surrender of Japan

complicated the external tasks of the new Prime Minister. The Colonial Development and Welfare Act of January, 1945, the offer of eventual dominion status to Burma in May, and the continuing negotiations with India, one important aspect of which was the White Paper of June 14 asking India to plan self-rule with a revised Executive Council—all these presented problems of continuing and possibly increasing perplexity. (See articles on BRITISH EMPIRE, BURMA, and INDIA.) In addition, British intervention in Greece and the Levant left a residue of delicate relations with the interested powers as well as with the inhabitants of the regions directly affected.

Relations with Greece. Churchill's trip to Greece in the last days of December, 1944, and the agreement made there that Archbishop Damaskinos should be appointed regent were in essence approved by the House of Commons on January 19 when a vote of confidence in the Government's policy on Greece was carried by 340 to 7. In February the reports of Rex Leeper, British Ambassador in Athens, on the treatment of hostages by ELAS (National Popular Liberation Army), together with other letters on the subject, were published as a British White Paper. Harold Macmillan, Minister Resident in the Mediterranean Theater, was present at the signing of an agreement between the Greek Government and the Central Committee of EAM (National Liberation Front) early in February. From January to June a British trade union delegation worked with Greek trade union factions and induced them to come to an agreement, form a central body, and hold elections.

British Communists, meeting in their annual congress in November, demanded the removal of Bevin as Foreign Secretary because of his attitude towards Greece and the Soviet Union. The chairman of the British group in the Allied Mission for observing the Greek election in 1946 was T. T. Windle, secretary of the London branch of the Labor Party.

Intervention in the Levant. On May 31 Churchill ordered the British Commander-in-Chief in the Middle East to intervene in Syria and Lebanon, where fighting between local forces and the French had been going on for some days. In spite of the imminence of the general election the move was endorsed by Attlee. General de Gaulle was critical of the action in the French Assembly on June 19, saying that for four years Britain had intervened in Syria in a manner damaging to French authority and interests. The Labor Government was able to announce a diplomatic victory at the end of the year, when Foreign Secretary Bevin, speaking in the House of Commons on Dec. 13, made public the terms of an agreement between the Governments of Great Britain and France providing for removal of their troops from the Levantine states and for mutual support on Middle Eastern questions.

Britain at San Francisco. One of the less explosive tasks of the year in the international field was participation in the conference at San Francisco and in subsequent meetings of United Nations commissions and agencies. There was, to be sure, some dissatisfaction in the Labor Party when it was announced that Foreign Secretary Eden and not Deputy Prime Minister Attlee would serve as leader of the British delegation, but the issue was allowed to die down. Eden's effectiveness as one of the four presiding chairmen and in his relations with the press was marked, and his departure from San Francisco because of illness called forth expressions of regret beyond the requirements of diplomatic usage.

The British delegation, which was an all-party one, gave outward signs of harmony and cooperation. The delegates had been told in the House of Commons on April 17 that the proposed constitution would produce no utopia. Attlee and Lord Cranborne, leader of the House of Lords, said that they were going to San Francisco with open minds and advised the public to expect no miracles of perfectionism. Possibly because of these influences the role of Britain at San Francisco was less conspicuous than had been anticipated. The delegation supported the Americans in admitting Argentina and the Russians in accepting White Russia and the Ukraine. Governmental representatives appeared warmer in supporting the United Nations Relief and Rehabilitation Administration, which held a council meeting in London later in the summer.

Prime Ministers at Potsdam. The presence of Attlee at the "Big Three" Potsdam Conference on German reparations in July had been for some weeks a matter of definition in British politics. In the course of the election campaign Harold Laski, Chairman of the National Executive Committee of the Labor Party, stipulated that Attlee, although Deputy Prime Minister, could attend as an observer only. Laski wrote that the Labor Party "rejected the Tory doctrine of the continuity of foreign policy" and would not be "bound by the decisions which Mr. Churchill and Mr. Eden choose to accept." Churchill took a hand and said that he had hoped that Attlee would act as "friend and counsellor" and that the British delegation would work together as they had at San Francisco. Attlee's position was that the chairman of the Labor Party had no right to give him instructions.

Attlee of course went to Potsdam with the other members of his delegation, but the precise part that he took was not described. He returned with Churchill and Eden to receive the election returns on July 26. Neither Churchill nor Eden went back to Potsdam after their defeat, and Attlee with Ernest Bevin as Foreign Secretary took up the task of policy making. It was reported that both were fresh and vigorous participants.

Ministerial Tours. Another task taken up by the new Prime Minister and his Foreign Secretary was that of going to any part of the world where important negotiations involving their country were undertaken. Churchill's record in 1945 included Malta on February 2; Yalta, with Eden, February 4-11; Greece and Egypt later in the month; Field Marshal Montgomery's headquarters and a section of reconquered Germany in March; a vacation in Southern France after the polling on July 5, and Potsdam with side trips to Berlin. At the end of July Churchill, instead of going back to Potsdam, declined the Order of the Garter and went house-hunting.

Attlee had been in Paris and Brussels early in March to discuss with the French and Belgian Governments the speeding up of British supplies for civilians. The next important task fell to Foreign Secretary Bevin, and it was performed at home—that of representing his country at the ill-starred Council of Foreign Ministers in London in September. He conspicuously failed to attain sympathy with Soviet Foreign Commissar Molotov, and was said to have twitted Molotov about the latter's bourgeois origin as compared with his own proletarianism.

The meeting of the foreign ministers of Britain, the United States, and the U.S.S.R. in Moscow in December ended more satisfactorily, with agreement reached on action in many of the disturbed

areas of the world and on a proposed method for international control of atomic energy. On returning to London on Dec. 28 Bevin said that he felt that the three foreign ministers had "done a very good piece of work."

Prime Minister Attlee was in Washington in November for a conference with President Truman and Prime Minister King of Canada on atomic energy control, and with them issued a joint statement on Nov. 15 providing for keeping manufacturing processes secret until the UNO should set controls for the peaceful use of atomic energy. On Nov. 17 he reached Ottawa with Prime Minister King and later addressed both houses of Parliament. On Nov. 20 Attlee was back in London where House of Commons affairs, especially those concerned with the Labor Government's nationalization program, demanded his attention with increasing urgency.

Oil Pact with U. S. A new Anglo-American oil agreement which, it was hoped, would serve as a basis for a multilateral agreement to which the Soviet Union and other governments would affix their signatures, was signed in London on Sept. 24 by Harold L. Ickes, United States Petroleum Administrator, and Emanuel Shinwell, British Minister of Fuel and Power. The agreement was a revision of the Anglo-American agreement on petroleum signed in Washington in August, 1944 but withdrawn by President Roosevelt in January, 1945, because of opposition in the United States Senate.

In the new agreement the American unwillingness to accept international regulation of the domestic oil industry and the British reluctance to consent to control of overseas sources of supply if that important exception was made were both recognized, and the agreement was correspondingly limited in scope. It provided for setting up an Anglo-American Petroleum Commission and aimed at the eventual negotiation of an international petroleum agreement.

Other Foreign Problems. Prime Minister Nokrashi Pasha of Egypt told the Egyptian Parliament on Nov. 12 that Britain had been asked to withdraw all troops from Egypt and to give up the control she exercised with Egypt in the condominium of the Anglo-Egyptian Sudan. Egypt became a sovereign state by the Anglo-Egyptian treaty of 1936 and British military occupation was terminated. However, British troops which entered Egypt when the latter's sovereignty was threatened had not yet been removed. The issue was again pressed in the Egyptian Parliament on December 2 by Makram Ebeid Pasha, Minister of Finance and leader of the dissident Wafdist party.

It was clear in December that the Labor Government resented American official and press criticism of British relations with Siam, with whom a British treaty was about to be signed. Hector McNeil, speaking in the House of Commons on December 20, said that "in view of the very misleading and tendentious statements which have recently appeared in the foreign press" he welcomed the opportunity of expressing the Government's friendly intentions towards Siam as an independent country. British-Dutch conferences on Indonesia which ended on December 28 appeared inconclusive, but there was evidence that British policy of cooperation with the Netherlands was not yet modified and that the two governments agreed that the conditions of law and order necessary for Indonesian home rule were far from attainment.

A review of the Labor Government's foreign policy was given in the House of Commons by Bevin on Nov. 23, in reply to a debate. The

Foreign Secretary announced the British Government's decision to retain parts of the Middle East Supply Council, spoke cautiously of events in Persia, described the progress of negotiations for the withdrawal of British and French troops from Syria, and emphasized that British action in Indonesia was taken in pursuit of a general mandate accepted on behalf of the United Nations. He devoted a considerable part of the review to the situation in Greece and defended the advice to postpone the plebiscite to 1948.

Anglo-American Financial Talks. The international negotiations of the year which attracted the widest attention in the United States (outside of questions of war and peace) were the British-American financial talks which began in Washington in September and concluded with the loan agreement between Britain and the United States signed on Dec. 6. The two greatest trading nations in the world were involved and intricate questions of long-run financial and commercial policy were under consideration.

Lend-Lease operations were halted by order of President Truman on August 21 and the export-import situation of Britain at once became an acute issue. Food gifts from the Dominions increased in amount after this time, but welcome as they were, they could be no more than palliative and without relation to the long-run problem of restoring Britain's prewar buying power abroad. Negotiations for an American grant or loan were opened in Washington on September 11 when the British and American delegations met at the State Department and agreed that the agenda would include financial problems, Lend-Lease termination and settlement, commercial policy, and surplus property disposal abroad. In the absence of Secretary of State Byrnes, Assistant Secretary of State William L. Clayton was chairman of the American group. The British delegation included Lord Keynes, British Ambassador Lord Halifax, and Robert H. Brand, head of the Treasury group.

Britain's International Position. The purpose of the conversations was to devise means by which Great Britain could secure goods necessary for her reconstruction and the revival of her peacetime industry and foreign trade. Her position was as follows, according to a White Paper issued on December 6, containing figures used in the conversations: In the course of the war she had liquidated most of her foreign assets and become a debtor nation. In that period £1,118,000,000 of foreign investments were sold and debts owed abroad increased from £760,000,000 to £3,335,000,000. These liabilities, mainly in the form of balances owed within the sterling area, showed as their largest item obligations to India, Burma and the Near East, which amounted to £1,732,000,000.

In order to pay for the prewar volume of imports into Britain, the volume of exports must be increased by 50 per cent, taking into account the decline in income from other sources abroad. Allowing for other factors, however, such as the repayment of war and postwar debts and changes in the population, the necessary level of exports might in fact be nearer 75 per cent above the prewar level. Restoring home production to furnish exports with which to pay for necessary imports was the long-run financial problem.

Points at Issue. An issue which came up early in the negotiations was the possible acceptance by Britain of the necessity of scaling down those of her debts owed to the sterling countries, to correspond with the partial cancellation of Lend-Lease obligations to the United States which would undoubt-

edly take place. Asking such countries as India and Egypt for this concession, in view of the respective political situations, would undoubtedly involve delicate dealings for Britain.

As negotiations continued into October, American pressure appeared to turn towards requiring Britain to abandon imperial preference as a condition of obtaining a loan. There were sharp reactions from the self-governing Dominions when this proposal became known, since the Dominions are independent in their trade policy. In the course of the conversations the British Government approved in principle the American proposals for an international trade charter and an International Trade Organization, to be developed at a United Nations conference on trade and employment to be held in 1946.

When Sir Edward Bridges, permanent Secretary of the British Treasury and Secretary to the Cabinet, arrived in Washington on December 1, it was apparent that negotiations were drawing to a close. On December 6, the agreement was signed in Washington by Lord Keynes, Lord Halifax, Secretary of State Byrnes, and Secretary of the Treasury Vinson.

Terms of the Agreement. The terms provided for a loan of \$3,750,000,000 to be repaid by the year 2001. Interest at 2 per cent is to begin in 1951. The line of credit of \$3,750,000,000 may be drawn upon by the United Kingdom up to Dec. 31, 1951. Lend-Lease obligations were set at the nominal sum of \$650,000,000, to be repaid in the same way as the line of credit.

The United Kingdom agreed to scale down certain sterling debts and to relax import and exchange controls, including exchange arrangements affecting the sterling area. The two governments issued a separate joint statement asserting their intention to relax trade barriers of all kinds.

Reception in Britain. The loan agreement could become effective only after action by the British Parliament and the United States Congress. In the House of Commons bills to approve the Bretton Woods Agreements and the Loan Agreement were promptly introduced. After two days of gloomy debate the loan bill was approved 345 to 88 and the Bretton Woods bill by a vote of 314 to 50.

The Opposition in the House of Commons emphasized dislike of the gold standard, resentment against American high tariff policy, fear of being engulfed in the economic depressions characteristic of the American economy, and doubt as to Britain's being able to carry out the obligations. In the House of Lords opposition to the terms of the loan was far stronger and many members boycotted the issue by refusing to vote. The loan bill was carried by a vote of 90 to 8. Resentment against the terms of the loan appeared to be general in Britain, but no clear alternative to accepting it presented itself.

Labor's Nationalization Program. The central point of interest in the policy of Britain's new Labor Government, both inside the country and abroad, was its nationalization program. In the King's Speech at the state opening of Parliament on August 15 (Parliament had held a brief first meeting on July 31) it was announced that bills would be introduced to nationalize the Bank of England and the fuel and power industries and to organize air transport, and that machinery would be set up to provide for the effective planning of investment. The Government would secure "by suitable control or by an extension of public ownership that our industries and services shall make their maximum contribution to the national well-being."

From the public's point of view the two pivotal

nationalization projects were: that for the Bank of England, public ownership of which had long been a cherished tenet of the Labor Party's creed; and that for nationalization of coal mines, since the industry was old, sick, and a prolific source of legitimate unrest and dissatisfaction. The Bank bill came first, on October 9. Nationalization is to be accomplished by the issue of government stock in exchange for that now held by the shareholders, with a guarantee to the shareholders of the same income for the next 20 years that they received from their previous holdings over the past 22 years. The Governor, Deputy-Governor, and directors will in future be appointed by the Crown, but the present Governor, Lord Catto, is to remain "for an appropriate period."

The bill obviously makes little change, at least for the time being, in the position of the Bank of England. *The Economist* (London) commented on the bill on October 13 in these words: "The scrupulous care that is taken in the bill to change nothing of any account is the best proof that the members of the Government do not believe the accusations that their Party has so often brought against the Bank of England."

The text of the coal mines nationalization bill, published on December 20, provides that a 9-member National Coal Board, with full powers to carry out all operations involved in production and distribution, under general policies laid down by the Ministry of Fuel and Power, will take title to the coal industry. The coal industry was already partly nationalized when this bill was introduced. In accordance with the provisions of the Coal Act of 1938 the Coal Commission took over rights and royalties from their owners on July 1, 1942, and the owners were compensated by the Government. On July 19, 1945, British mine owners accepted a Government plan for close supervision of the industry to compel modernization. There was a provision in this plan, however, that private enterprise should be preserved. But government ownership of coal mines was one of the major planks in the Labor Party's election program and it was just one week later that Labor's election victory was announced.

A plan to organize the cable and wireless communication services of the Empire under public ownership was announced on Nov. 1 in the House of Commons by Chancellor of the Exchequer Dalton, and on the same day Lord Winster, in the House of Lords, made public the Government's plan for the organization of three public corporations to operate all scheduled civil air services. In the House of Commons Ivor Thomas, Parliamentary Under Secretary for Civil Aviation, told members that it was "the object of the Government to make air travel a normal mode of travel for the masses and not a luxury for the few."

This was as much as the Opposition could endure (although the nationalization of the gas industry was to be recommended on December 4) and when Herbert Morrison, Lord President of the Council, disclosed to the House of Commons on Nov. 19 a 5-year nationalization plan the opponents became rather noisy. The situation was not ameliorated by Morrison's refusal to have a debate. The Conservative complaint was that the Government was going far beyond the King's Speech, although it was obvious that it was not going beyond the election program.

Conservative tempers remained high, however. It was at this juncture that Prime Minister Attlee returned from his atomic energy talks in Washington. A two-day debate on policy in early December

ended on Dec. 6 with a Government victory of 381 to 197. Former Prime Minister Churchill had been at his most pungent, but Attlee's incisive and occasionally humorous address just before the vote greatly enhanced the latter's prestige.

Production Problems. The problem of increasing Britain's industrial and agricultural production could wait neither for nationalization measures nor for financial aid from abroad. Britain's staple industry, cotton manufacturing, which for many years had been nearly as sick as coal, finally decided to accept a plan proposed in October by Sir Stafford Cripps, President of the Board of Trade. The proposal involved setting up tripartite "working committees" for such industries as were willing to cooperate. Agricultural producers were encouraged by the announcement on Nov. 15 by Thomas Williams, Minister of Agriculture, that the Government would assure markets and guarantee prices and would promote to the fullest the home production of good food.

Freight movements in the London area were hampered by a "go-slow" strike by dockers in June and July, but a more serious set-back came with a dock strike which broke out in Birkenhead on Sept. 25, spread to all major ports involving 43,000 workers, and lasted until Nov. 5. In October the Government called out troops to unload strike-bound food ships. The return to work was on the basis of a 30-day truce for negotiating higher wages, a 40-hour week, decasualization, and welfare. On Dec. 11 the committee of investigation, appointed by the Ministry of Labor under the chairmanship of Mr. Justice Evershed, made an award of increased wages which was accepted by the workers.

Social Services. Housing continued to be the most pressing social and economic problem confronting the United Kingdom. The Labor victory in the election brought Aneurin Bevan to the Ministry of Health, with responsibility for the program, but progress was slow, partly because of the continuing labor shortage.

The extension and coordination of Britain's social insurance system also made headway slowly in 1945. The Family Allowances Bill, providing for postwar grants of 5 shillings weekly for each child after the first or only child, passed successfully through Parliament in the spring. In the autumn the Labor Government's bill to place compensation for industrial accidents on the basis of a contributory service was also approved.

Demobilization and Decontrol. Demobilization of the service forces began on June 18 and by the end of July the weekly release rate reached 24,000. After the end of the war with Japan repeated revision of plans was necessary. By the middle of December it was apparent that a Government plan announced in October for bringing home 1,500,000 men and women from the military service by the end of the year would be realized.

Opposition spokesmen criticised the use of 1,450,000 men and women in producing war equipment and supplies at the end of the year, as well as the official reluctance to remove controls. Bevin's last act before leaving the Churchill Government was his order of May 28 relaxing control over the hiring of labor, but control over employment itself was not relieved until Dec. 20, when some 3,500,000 men and women were freed from direction of their employment. Scarcities of clothing, fuel, and food remained serious, although some slight food concessions were granted for Christmas.

The Budgets. Britain had two budget days in 1945, one on April 24 under the Coalition Government

and the second on Oct. 23 under the Labor Government. The first budget, recognized as an interim measure, carried only slight tax relief. Sir John Anderson, Chancellor of the Exchequer, told the public that conditions would remain difficult and that they could not expect to go on a spending spree after the end of the war in the Pacific.

The budget presented by Labor Chancellor of the Exchequer Hugh Dalton took a shilling (5 per cent) from the income tax in 1946, increased the surtax, reduced the excess profits tax from 100 to 60 per cent but removed postwar credits, abolished the purchase tax on certain household equipment, and reduced the tax on motor vehicles. Dalton warned that civil expenditures would increase in the coming months.

Other Events. Earl Lloyd George of Dwyfor, born David Lloyd George, whose name headed the New Year's Day honors list as the recipient of an earldom, died at his home in Caernarvonshire, North Wales, on March 26. Lloyd George spent 52 years in the House of Commons as Liberal member from Caernarvon, and was Chancellor of the Exchequer and Prime Minister in World War I as well as servant of his country in many other capacities in the course of his long public life. Earl Lloyd George's second son, Major Gwilym Lloyd George, was Minister of Fuel and Power in the Churchill Government.

Treason trials were one of the unpleasant but necessary consequences of the reopening of frontiers after the end of the war. William Joyce ("Lord Haw Haw") and John Amery, prodigal son of Leopold S. Amery, former Secretary of State for India, both of whom had broadcast from the Continent for the enemy, were tried for treason in British courts and sentenced to death.

Population Trends. The population of Great Britain increased from 44,937,444 in 1931 to 46,607,000 (estimated) in 1941. A provisional birth-rate of 18.0 per thousand in England and Wales in 1944 was the highest recorded since 1925. The death rate for the same year, 11.9, was below that for 1943 but higher than that for 1942. The infant mortality rate of 46 per thousand was the lowest ever recorded.

Religion and Education. The Church of England with an Episcopal form of government, and the Church of Scotland (Presbyterian) are the "established religions" in England and Scotland respectively. The leading denominations in England and Wales according to membership are the Anglican, Roman Catholic, Methodist, Congregationalist, Baptist, and Calvinistic Methodist. In Scotland the leading denominations are the Presbyterian and Roman Catholic.

Elementary education is provided free throughout Great Britain, and under the heading of "elementary education" are included large numbers of senior and central schools providing education of a secondary grade. At the age of 11 some children, usually chosen by examination, pass on to secondary schools, where they receive an education designed for entrance to professional positions or for university life. Other selected children pass into central schools, which usually include some vocational work, and the unselected children enter senior schools or senior classes. In Scotland all forms of post-primary education up to 18 are provided free, except in a few schools, while in England and Wales modest fees are charged. Outside of this system are the "public" (endowed) schools.

There are 11 universities in England, 4 in Scotland, and 1 in Wales. About two-fifths of the university students are assisted by the state in normal

times. Extensive reorganization of the educational system has been undertaken by both the Coalition and Labor Governments.

Production. Detailed statistics of agricultural, mining, industrial and other production were withheld during World War II. In the course of the war, agricultural production was increased until it supplied two-thirds to three-fourths of home food needs as compared with approximately one-third before the war. Emphasis was put on prewar crops, including potatoes, sugar beets, vegetables, wheat, oats, and barley.

Before the war iron and steel, textiles, and coal were the staple products of British industry, with chemicals, machinery, electrical products, engineering products, and other specialties showing increased activity. Accounts of the production of individual war industries were made public in the autumn in *The Times Record of British War Production, 1939-1945*. From 1939 to 1944 the number employed in munitions rose from 1,150,000 to 4,300,000, and the total number of men and women in the services or in industry increased from 18,500,000 to 22,000,000.

Foreign Trade. Britain's export trade in the third quarter of 1945 failed to reflect any results of the world-wide trade expansion program undertaken by the Government. Exports fell off in comparison with the second quarter of the year, and stood at £272,000,000 for the first 9 months of 1945, compared with £188,000,000 for the corresponding period in 1944, and £353,000,000 in 1938.

Imports, on the other hand, continued to stand above the prewar level. Imports in the first six months of 1945 were at the rate of £1,150,000,000 a year, as compared with £858,000,000 in 1938. This situation, taken in connection with Britain's loss of income from overseas investments, accentuated the problem of maintaining foreign purchases which was already apparent and which entered into the Anglo-American loan negotiations.

ALZADA COMSTOCK.

GREECE. A Balkan state, occupied by Axis troops from April-May, 1941, until October, 1944. Capital, Athens. Greece has an area of 50,147 square miles (mainland, 41,328; island, 8,819). The population was estimated at 7,200,000 in 1941 (7,338,000 at 1940 census). Estimated populations of the chief cities in 1939 were: Athens, 392,781; Piraeus, 198,771; Salonika (Thessaloniki), 236,524; Patras, 61,278; Kavalla, 49,980; Canea, 26,608; Corfu (Kerkyra), 32,221.

Religion and Education. School attendance in 1937-38 was: Elementary, 985,018; secondary, 92,687; university, 7,998. The 1928 census returns showed 5,961,529 members of the Greek Orthodox Church, 126,017 Moslems, 72,791 Jews, 35,182 Roman Catholics, and 9,003 Protestants.

Production. Previous to the war about 54 per cent of the working population was supported by agriculture and fishing, 20 per cent by industry, and 8 per cent by commerce. The country was dependent upon imports for more than 25 per cent of its total food consumption and for 40 per cent of the wheat consumed. Wheat production declined from the prewar average of 700,000 metric tons to an estimated 368,300 tons (this is exclusive of the output of Thrace and Eastern Macedonia). Estimated yields of other crops in 1940, except as stated, were (in metric tons): tobacco, the main cash crop, 45,000; currants, 121,775; raisins, 23,000; figs (exportable crop), 22,000; barley, 239,500; oats, 174,200; rye, 57,900; olive oil, 80,000 tons in 1942-43; ginned cotton, 16,900; potatoes, 163,300 in 1939;

corn, 261,500 in 1939; wine, 64,130,000 U.S. gal. in 1942.

Factory production in 1938 (excluding wine, olive oil, and wheat products) was valued at 13,552,000,000 drachmas. Mineral output included iron ore, pyrites, lignite, manganese, lead, zinc, chrome, and nickel-cobalt.

Foreign Trade. In 1941, imports were valued at 4,840,000,000 drachmas (12,215,326,000 in 1940) and exports 3,904,000,000 drachmas (9,079,380,000 in 1940). Chief sources of 1941 imports (millions of drachmas): U.S.S.R., 673; Germany, 544; United Kingdom, 354; others, 3,269. Distribution of exports (in millions): Germany, 1,825; U.S.A., 904; United Kingdom, 486; Italy, 141; others, 548. Exports included raisins, tobacco, olive oil, wine. Imports included wheat, barley, rice, sugar, coal, mineral oils.

Finance. In 1941-42 revenue amounted to 16,500,000,000 drachmas; expenditure, exclusive of occupation costs, 30,300,000,000 drachmas (this includes the amounts of interest due on foreign debts but not paid). Estimates of the cost of Axis occupation levied on Greece varied from 18 to 180 billion drachmas annually, the latter figure including credits extended to the Axis countries by the puppet regime in Athens.

German exactions and rapidly spreading inflation boosted the public debt far above the 95-billion-drachma level reported for Sept. 30, 1940. The average exchange rate of the drachma was \$0.0082 in 1939. German authorities fixed the official rate at 1 drachma equals 0.0167 reichsmarks, or \$0.0067 (based on the German official rate for the U.S. dollar). The quotation for the pound sterling, which was 1,500 drachmas before the German occupation, was reported at 42,000 drachmas in April, 1942, and 130,000 drachmas in July, 1942.

Transportation. In 1940 Greece had approximately 1,864 miles of railways, 8,440 miles of highways, air connections from Athens to most of the principal European cities, and a merchant fleet of some 607 vessels (of 100 tons or over) aggregating about 1,780,700 gross tons. Much of the transportation and communication network was disrupted or destroyed by the Italo-German invasions of 1940-41. Half the merchant marine was destroyed or captured during the same period. The remainder (about 200 ships of 1,000,000 tons manned by 6,000 sailors) entered the service of the Allies under British direction.

Government. Premier John Metaxas administered Greece as a dictatorship from Aug. 4, 1936, until his death on Jan. 29, 1941. The government remained a monarchy in form under King George II, who had been restored to the throne Nov. 25, 1935, in accordance with a plebiscite, to rule under the Constitution of 1911. King George signed the 1936 decrees which suspended constitutional guarantees, dissolved Parliament, abolished political parties, and imposed strict control over the press and other means of communication. Thereafter, all legislation was enacted by royal decree.

According to a resolution passed by the Greek National Assembly Oct. 10, 1935, the 1911 Constitution was to remain in force until the enactment of a new Constitutional Charter. King George on Oct. 22, 1941, issued a royal decree regulating the functions of state authorities in cases in which the 1911 Constitution could not be fully applied owing to the absence of the Government from Greece.

Italian forces invaded Greece Oct. 28, 1940, and were driven out by the Greek Army, which advanced and occupied one-third of Albania by Apr. 6, 1941, when the German invasion of Greece be-

gan. The Greek armed forces were defeated and a British expeditionary force was expelled. King George, with members of the Government, left Athens April 22 and, after a temporary stay in Cairo, Egypt, was transferred to London, effective Sept. 22, 1941.

Axis forces were in control of Greece until 1944 when political and military events forced German and Bulgarian armed forces to leave and the whole country was cleared by Oct. 15, 1944. The Greek Prime Minister, M. Papandriou, arrived in Athens on Oct. 18, 1944. King George, on Dec. 30, 1944, set up a Regency to last during the period of emergency and until the will of the people should be known as to whether they desired a monarchy or a republic. Regent in 1945: Archbishop Damaskinos (sworn in, Dec. 31, 1944).

Events, 1945. The year 1945 found civil war raging in Greece. When the Germans withdrew early in October, 1944, they left the country in control of EAM (Ethnikon Apeleftherotikon Metopon, "National Liberation Front"), a resistance movement comprising various groups, with the Communists dominant in its direction. For more than a year EAM had been suspect to the British and the Greek government-in-exile, which was amenable to the British, because it was thought that the Communists in EAM planned to seize control of the government when the country should be liberated from the German occupation. British and Greek government forces which entered the country late in October, 1944, were inadequate in numbers and organization to take over the administration of the country at once. In order to establish its authority the government had to create a national army, and it demanded that "volunteer" military organizations, specifically ELAS, EAM's military arm, should disband. EAM refused to disband ELAS without assurances that it would not be victimized, and demanded in turn that the strongly royalist and anti-EAM units of the Greek army known as the Mountain Brigade and the Sacred Company likewise disband or, alternatively, that ELAS be allowed to retain forces equal in number to those units. Firmness on the part of the British resulted in the resignation on December 1 of the six ministers sympathetic to EAM, of whom two were Communists, and violence broke out on December 3. At first ELAS held the upper hand, the British and Greek government forces being confined to the few blocks in Athens lying between Syntagma and Omonoia Squares, but after the middle of December considerable British reinforcements arrived, and ELAS was forced to retire before superior forces equipped with aircraft, tanks, and other modern weapons. In their retreat from Athens ELAS carried off not only numerous military prisoners but also some thousands of civilian hostages, in retaliation, they alleged, for the thousands of civilian EAM sympathizers which the British had deported to Africa. The disposition of these hostages became a major issue in the subsequent peace negotiations.

On the last day of 1944, after Prime Minister Churchill had returned from a Christmas Day visit to Athens, Archbishop Damaskinos became Regent of Greece, and at the beginning of 1945 General Nicholas Plastiras, known as a convinced anti-royalist, became Prime Minister. On January 12 a truce was concluded between ELAS and the British commander, General Ronald Scobie. British and American public opinion, which had been disturbed by the use of armed force against even a recalcitrant section of a heroic allied people, was neutralized by reports of ELAS atrocities. Churchill

first characterized EAM as a band of "brigands from the hills," and later (January 18) declared that defections had reduced EAM to its "Communist or rather Trotskyist" core. The British and the Greek government declared that only avowed Communists could represent EAM at the peace negotiations. After long dispute first on the composition of the representation and then on the terms, agreement was reached at Varkiza, near Athens, on February 12. EAM was represented by George Siantos, Secretary of the Communist Party, Dimitrios Prtsalides, Secretary of EAM, and Ilias Tsirimokos, Secretary of the socialist organization called ELD (Enosis Laikis Dimocratias, "Union of Popular Democracy"). The government negotiators were John Sofianopoulos, Minister of Foreign Affairs, Perikles Rallis, Minister of Interior, and John Makropoulos, Minister of Agriculture. Of these Sofianopoulos is said to have been the most conciliatory and to have contributed most towards effecting an agreement. The agreement provided that (1) ELAS disarm, and surrender its weapons to a fixed number; (2) a new army would be formed, in which ELAS men might be enrolled without prejudice; (3) the Communist Party might continue as a legal organization and EAM continue political activity; (4) plebiscite and elections would be held within a year; (5) only participants in the insurrection guilty of offenses according to ordinary criminal law would be prosecuted.

On February 20, when Minister of Interior Rallis's authority was undermined by the appointment of a Minister of Security, a title which had become odious under the Metaxas dictatorship, Rallis resigned his portfolio, believing that the agreement to which he had been a signatory was not being fairly implemented. Plastiras averted a crisis at this point and again on March 8 by shuffling his cabinet. Plastiras was as firmly anti-Communist as anti-royalist, and his appointees were mainly old revolutionary associates who shared his views. He took a much firmer line towards the British than his predecessors or successors, and at one time said to Ambassador Leeper, "Sir, we have not been liberated from German occupation only to submit to British occupation." But the British could not be ignored. As the BBC Athens correspondent wrote on January 28, "The British army is likely to remain the single solid factor in Greek politics for some time to come."

Meanwhile Plastiras's government was being attacked by both Right and Left. The Left charged that the Rightists, whom the British suppression of the insurrection had left in control of the security forces and the administration, were dealing high-handedly with Left sympathizers. Hundreds were being beaten and arrested with no charges, and thousands were being kept in jail. Armed bands of the royalist Khi organization terrorized the Leftist sympathizers, and a secret organization called SAN (Syndesmos Axiomatikon Neon, "League of Young Officers") controlled the General Staff, placed its men in key positions, and saw to it that conscripts suspected of Leftist sympathies were kept out of the army. The Right, though dominant, objected to Plastiras's republicanism, and succeeded in forcing his resignation on April 8 by publishing a letter which he had addressed to Emmanuel Tsouderos in July, 1941, when Tsouderos was Prime Minister of the government-in-exile, in which he said that resistance to the Axis was futile.

Plastiras was succeeded by Admiral Peter Voul-

garis, whose government was, as Plastiras's had been, "service" rather than "political." But the change amounted to a victory for the Right, for, unlike Plastiras, Voulgaris was charged by republicans with favoring the monarchists and by the Left with being a tool of the financial powers. Under Voulgaris the security situation was not improved and the financial situation deteriorated. In November, 1944, the sovereign had been fixed at 2,300 drachmas and the dollar at 149. Towards the end of March the sovereign was worth 7,300 and early in May, 14,000, while the dollar reached 900. Attempts to impose taxes or to effect economies in the budget were half-hearted; the government's chief revenue continued to be derived from the sale of UNRRA supplies. In the distribution of these supplies (which was wholly a Greek government and not an UNRRA responsibility) many abuses were alleged. To increase its revenues the government cut down on the number of indigence cards issued, so that many needy persons were deprived of distributions, and in many regions it was the policy to favor partisans of the Right and discriminate against sympathizers of the Left. Raw materials distributed to manufacturers at low cost in order to set industry in motion were hoarded by industrialists for further depreciation of the drachma.

During the Voulgaris regime also agitation for rectification of the northern borders reached a crescendo. On February 28 Regent Damaskinos had delivered a speech in which he demanded territorial compensation for Bulgaria's misdeeds, and among his audience there were heard shouts of "On to Sofia," "Sofia for fifty years!" The Right press waged a vigorous propaganda campaign for territorial accessions on the Albanian and Bulgarian borders through the spring and summer, and the radio of Moscow as well as those of Sofia, Tirana, and Belgrade responded by calling the Greek regime "Monarcho-fascist." Russia failed to send the ambassador she had earlier announced she would send. The Left press in Greece deprecated the agitation and charged that it was calculated to distract attention from internal problems, to justify the creation of a large army which should become a Rightist tool, and, above all, to foment trouble between Russia and the western Allies. The Right charged that the Left preferred their Slav sympathies to the national interests of Greece, and it became evident in the course of the year that the Right hoped for and expected as inevitable a war between Russia and the western Allies. With the announcement of the atom bomb these hopes were quickened; it was thought that the Slav peril could now be ended speedily and inexpensively, once and for all. The Right was indignant when John Sofianopoulos, who had been held over as Foreign Minister from the Plastiras Cabinet because he was already en route to San Francisco when Voulgaris came into power, voted in the United Nations conference in that city with Russia and against Argentina. When he returned to Greece towards the end of June Sofianopoulos resigned his ministry and made a public statement to the effect that conversations with foreign statesmen in San Francisco had convinced him that Greece would not get a sympathetic hearing at the peace conferences unless she formed a "political" government in which all parties should be represented.

The victory of the Labor Party in the British elections, which was announced at about the same time, gave the Center and Left hope that a politically representative government would indeed be formed, but their hopes were disappointed. The

Voulgaris government continued in power, and proceeded to prepare for the elections which the Right was clamoring for. Their position was that no effective measures could be taken to regularize the political and economic situation until elections had been held. They clearly expected to capitalize on the reaction from the excesses of the December insurrection; and, as non-Rightist critics observed, they wished to exploit the advantages inherent in their control of the army, gendarmerie, administration, and judiciary.

Rightist control of the country had become so high-handed that all parties except the (royalist) Popular Party protested. Such conservative leaders as Sofouls, Kafandaris, Tsouderos, and Mylonas made a demarche to the Prime Minister on the White terror early in June, and at the same time the deterioration of the currency caused wide distress and provoked public outcry. The activity of the open and secret royalist organizations continued unabated and the border tensions grew more strained, but steps were taken to remedy the financial situation. Early in June Kyriakos Varvarevoss was made Vice Premier and Minister of Supply and immediately promulgated measures for regulating the chaotic economy. The drachma was stabilized at 4,000 to the gold sovereign or 500 to the dollar, and the state assumed control of production and distribution and assessed taxes on war profits. Varvarevoss' measures satisfied neither Left nor Right. The Left thought they favored the industrialists at the expense of the middle class and workers, and the Right resented the rigid controls and in fact succeeded in evading them until a new depreciation of the drachma should make the sums insignificant. The economic improvement was not sufficient to compensate for the vigorous objections which were being adduced by the Left and Center against the excesses of the royalist organizations and the demand for a "political" government, which, they insisted, could alone curb malefactors and prepare the country for a fair election.

The Voulgaris government resigned on August 9, but was again restored to power with only a few changes, chief among them being the elimination of Minister of Interior Tsatsos, Minister of Justice Soliotis, and Underminister of War Drakos, who had been responsible for maintaining order and preparing for the elections. The principal reason alleged for retaining the Voulgaris government was that Varvarevoss' economic reforms must not be interrupted, but on September 4 Varvarevoss resigned, and his successor removed the controls upon producers and prices. Scandals arose in connection with manufacturers hoarding and unfairly exploiting UNRRA raw materials, the depreciation of the drachma was accelerated, nor was improvement in other pressing problems visible. The gendarmerie continued to be dominated by the Right, and armed Rightist bands suppressed, sometimes brutally, those they suspected of favoring Left views. Known collaborationists continued in high office. The courts which tried the quiescent ministers in May and June pronounced sentences that even the Center castigated as ridiculously light. Collaborationists of the second degree, i.e. industrialists who had served the Germans, were then even more leniently dealt with. In October damning evidence was adduced against nineteen officers of the Special Security who were charged with having delivered over to the Germans for execution or with having themselves executed numerous patriots of the resistance, but only two received death sentences. When on October 29 the men of Sorkho in Crete attending the trial of five

persons accused of handing over fellow villagers to the Germans found the sentences too light, they promptly lynched the culprits.

The one cry of the Right was for early elections, which they maintained would at once regularize all political and economic problems, and the Voulgaris government acceded by fixing the election date for January 20, 1946. The compilation of the new election rolls was completed early in October. The Left had previously declared it would abstain from the elections, on the grounds that the election lists were being fraudulently compiled. Now a storm arose from the Center also. George Kafandaris declared that under prevailing conditions one-third of the electorate would be excluded from the polls, one-third intimidated, and the ballots of the remaining third falsified. Themistokles Sofoulis, venerable leader of the Liberal Party, declared that his and associated parties would abstain, and so, on October 9, the Voulgaris government was forced to resign.

The government crisis which was thus precipitated lasted until November 2, when a makeshift cabinet was contrived. The Regent first gave the mandate for forming a new government to Sofoulis, with the stipulation that collaboration of the (royalist) Popular Party must be secured. The Left agreed to accept whatever government Sofoulis might form, even if they themselves were not represented in it. But the Right insisted on exploiting the advantages of its position to the full, and declined to participate in any government unless January 20 were retained as the date for the elections; the elections, moreover, must be conducted on the simple majority (instead of proportional representation) system. Sofoulis and other leaders who attempted the task failed to form a government, and on October 17 the Regent himself assumed the premiership, retaining the ministers of the Voulgaris cabinet. The anomaly of the Archbishop serving also as Regent and as Prime Minister continued for two weeks, until on November 2 Panagiotis Kanellopoulos was named Prime Minister and succeeded in forming a government.

During the crisis the British had refrained from exerting direct influence on internal Greek governmental matters, although Ambassador Leeper was in constant touch with the Regent and with the party leaders who successively sought to form a government. But when the weak Kanellopoulos government emerged it came to be realized, through reports of members of Parliament who visited Greece and from press correspondents, that the hands-off policy actually amounted to support of the Right, and Under-Secretary for Foreign Affairs Hector McNeil was despatched to Athens to survey the situation and guide developments. Meanwhile want of confidence in the Kanellopoulos government and in the economic program which it announced accelerated the fall of the drachma, which by November 19 reached 72,000 to the sovereign. Only assurances that the drachma would be supported from abroad and that a firm hand would be applied to the country's finances could halt the decline, and a dinner speech of Mr. McNeil was construed to mean that the British would do neither. On November 20 the Kanellopoulos government resigned.

The new government which was thereupon formed, under dramatic circumstances, by British advice, constitutes the most significant political development of the year for Greece. The Regent informed a special council of ex-Prime Ministers that the British agreed to supply economic as-

sistance provided (a) the plebiscite on the question of the King's return were postponed to March, 1948; (b) a government of as broad a coalition as possible were formed, which should be able to hold genuine elections in the spring of 1946; and (c) the government would accept plans suggested by British experts in their efforts to ameliorate the economic situation. Mr. Sofoulis, octogenarian leader of the centrist Liberal Party, was given an unqualified mandate to form a government, and when the (royalist) Popular Party representatives refused to accept the conditions laid down by the British he proceeded without them. His first and key selections were George Kafandaris, leader of the centrist Progressive Party, as First Vice-Premier and Minister without Portfolio, Emmanuel Tsouderos, former Prime Minister of the government-in-exile, as Second Vice-Premier and Minister of Coordination with authority of the various ministries dealing with economic questions, and John Sofianopoulos, who as Foreign Minister under Plastiras had earned Rightist hatred by voting with Russia against Argentina at San Francisco, as Minister of Foreign Affairs. The Regent sought to procure the appointment of George Papandreu, who sought three ministries, including the war portfolio, and of Kanellopoulos, but Papandreu, who had been talking national socialism and monarchy, was hated by the Left, and Kafandaris, Tsouderos, and Sofianopoulos declared they would withdraw if Papandreu joined the government. Meanwhile King George II in London issued a communiqué declaring that the conditions under which he had consented to create a regency having been violated, he would thenceforward feel free to act according to the interests of his people. In view of this statement and having failed to influence the composition of the government as he desired, the Regent submitted his resignation.

The vacuum thus created lent color to the Rightist position that the Sofoulis government had no legitimacy and amounted to usurpation. Leftist elements were content with this development, and planned the legislation which, according to the constitution, enables the government to assume the headship of the state when the King and Heir Apparent are not available. But the British Foreign Secretary and British and American Ambassadors pleaded with the Regent to reconsider, and on November 24 he did in fact rescind the resignation. The Rightists, who had attacked the Regent for not resisting British pressure more firmly, were pleased with this step; their leader Stylianos Gonatas pointed out that now the Regent could do his patriotic duty by vetoing the measures proposed by the Sofoulis Cabinet. Moderate opinion was pleased with the new government and hopeful that it could restore the economy of the country and allay political tensions. The Left promised its support as long as the government would adhere to a truly middle course. The only vocal opposition came from the Right, who saw in the concession to the center the first step towards Communist control. A singular and ominous aspect of the change was that the only ground now common to the Right and Left was a strongly expressed impatience with British occupation, the Left feeling that British interference had caused all the troubles of the past year and would inevitably cause more trouble by reason of its continued basic hostility to the Left, and the Right feeling that England had betrayed its loyal ally for the sake of international advantages essentially hostile to Greek interests. During the short period the Sofoulis government has been in office it has done nothing

spectacular, but already the position of the drachma is somewhat improved, there is greater security for Leftist sympathizers, the election rolls are being subjected to revision, and there has been a marked decline of truculent saber-rattling in the direction of Greece's northern neighbors. On November 27 it was announced that Russia would now send an ambassador to Athens.

GREENLAND. A large island in northeast North America. It is a possession of Denmark (see below under *Government*). Area: 736,518 square miles. Population (1943): 20,163 natives and 500 Danes. The main settlements are Julianehaab, Godthaab (capital), Sukkertoppen, Kuttligssat, Godhavn, and Anngnagssalik. The natives speak an Eskimo dialect, while the Europeans speak Danish. Educational facilities include grade schools, high schools, and a training school for teachers. Practically all the inhabitants profess the Lutheran faith.

Production. Cod fishing is the mainstay of Greenland's economy. A total of 7,945 metric tons of cod was produced for salting in 1944. Agriculture is limited to sheep raising in the southernmost part of the west coast. The important minerals produced are cryolite (40,000 tons, 1944) and coal. Marble has been quarried and other minerals are known to exist. Trade during normal times is a monopoly of the Danish Government. During peacetime all exports are sent to Denmark (except for a portion of the cryolite output) and all imports are shipped from Denmark.

Foreign Trade. During World War II communications with Denmark were cut off and foreign trade was with the United States, Canada, and Portugal. Of the total imports in 1944, the United States supplied 52 percent, Canada 38 percent, and Portugal 10 percent. Imports and exports are mainly consumers' goods. There are no customs duties or other import formalities, but the commercial importation of commodities by private firms or individuals is prohibited.

Government. Normally the administration of all affairs pertaining to Greenland is centralized in the Greenland Administration section of the Ministry of State in Copenhagen. A Greenland Committee made up of 8 members of the Danish Rigsdag has charge of all questions pertaining to Greenland that are brought before that body. During the period of World War II, the administration of Greenland was subject to the agreement of Apr. 9, 1941, which was signed by the Danish Minister in Washington, D.C., and the U.S. Secretary of State. This agreement recognized the continuance of the sovereign rights of Denmark, and in order to maintain the status quo in the western hemisphere, allowed the United States the right "to construct, maintain, and operate such landing fields, seaplane facilities, and radio and meteorological installations as may be necessary." The agreement was to remain in force "until the present dangers to the American continent have passed."

CHARLES F. REID.

GUADELOUPE. A French West Indian colony consisting of two main islands—Guadeloupe proper (Basse-Terre) and Grande-Terre—and the dependent islands of Désirade, Les Saintes, Marie Galante, St. Barthélemy, and St. Martin (northern part only). Total area, 688 square miles. Population (1939 estimate), 310,000. Chief towns: Basse-Terre, capital (13,638 inhabitants), Pointe-à-Pitre (43,551). Education (1943-44): 131 schools and 25,630 pupils. Chief products: sugar, coffee, rum, cacao,

logwood, bananas, manioc. Trade (1938): imports 250,583,000 francs; exports 296,472,000 francs. Budget (1939): 83,608,979 francs (revenue and expenditure balanced). Public debt (Dec. 31, 1938), 12,110,210 francs (franc averaged \$0.0288 for 1938; \$0.0251, 1939). Roads (1940): 754 miles. Governor, M. Bertaut.

GUAM. The largest island of the Mariana group was ceded to the United States by Spain at the close of the Spanish-American War in 1899. It is situated in the mid-Pacific, 1,500 miles east of Manila, 1,300 miles south of Japan, 3,337 miles from Honolulu, and 5,053 miles from San Francisco. The island has a land area of 206 square miles, extending 30 miles north and south and 4 to 8½ miles wide.

Government. It is a United States naval station and saluting port under the jurisdiction of the Navy Department. The port is closed to foreign vessels of war and commerce except when special permission is granted by the Navy. The head of the Government is a Governor appointed by the President for a period of two years. The Governor and Commandant of the naval station is a naval officer. The executive, legislative, and judicial powers of government are all exercised by him. Although the people of Guam are not American citizens they are considered United States nationals and are ruled by a civil code established by the Governor. In an advisory capacity to the Governor is the Guam Congress which consists of a House of Council (16 members) and a House of Assembly (27 members).

Events, 1945. The island was recaptured from Japanese armed forces in July, 1944, and declared secured August 10, at the cost of 1,352 marines killed and many thousands wounded. Ten months after its recapture, it was turned into an impenetrable fortress and a staging area for the final assault against Japan. Thousands of marines, sea-bees, army engineers, and natives were employed on a 24-hour basis toward the building of harbor installations and airfields to enable B-29 bombers to take off and land after bombing the industrial centers and military installations of Japan, Iwo Jima, Okinawa, etc.

The extent of the damage suffered by the leading cities of Guam during the bombardment by our warships between June 19 and July 7, 1944, can readily be seen in the fact that all of the 1,750 homes in the capital city of Agaña, population 12,000, were destroyed and the cities of Sumay, Agat, Piti, and Asan were completely levelled. Within one year after its recapture by the Third Amphibious Corps, Guam became the most powerful of our advanced bases in the Pacific. The largest communications system in the world was established there in addition to harbor facilities for our largest battleships. Apra harbor handled more cargo than any other forward area. Fleet Admiral Chester W. Nimitz, and Lt. Gen. Barney Giles, Deputy Commander 20th Air Force, directed the ever-growing air and naval assault on Japan from Guam.

While these military preparations were going on natives were encouraged to work their farms and during one month the produce totaled 1,250,000 pounds. Two Victory ships, fully loaded with livestock, i.e. bulls, heifers, hogs, chickens, ducks, and turkeys, were dispatched to Guam to replenish depleted stocks. Eight hospitals were built in Guam to care for the casualties on Okinawa and Iwo Jima; 18 planes a day made 16-hour round-trip flights to evacuate the wounded.

Throughout the Japanese occupation (December 10, 1941) the people of Guam remained loyal to the United States and have cooperated with Navy personnel in harassing the Japs at the risk of death. In recognition of their contribution to final victory and their loyalty, Hon. Joseph R. Farrington, Delegate from Hawaii, introduced House Bill H.R. 3528 which would confer American citizenship on the natives of Guam.

The People. The population, according to the 1940 census, totaled 22,290 persons of whom 11,300 were males and 10,990 females. The native population is mainly of Chamorro stock, a mixture of the ancient Chamorro people (originally of Polynesian stock) with Spanish, Mexican, Anglo-Saxon, Japanese, and Chinese strains. On July 1, 1941, the estimated population was 23,394 which included 21,502 native-born, 812 foreign-born, and 588 members of the naval station. Agaña, the capital, had a population of 12,553 in 1941.

The native tongue of the inhabitants is Chamorro which is spoken at home, while English is used in the schools and in business. The predominant religion is Roman Catholicism. Education is offered on the elementary, which is compulsory, and high school levels. Enrollment in the public schools during 1940-41 averaged 5,084. All teachers in the public schools are Chamorros.

The Economy. Agriculture is the chief industry and the chief export products are copra and coconut oil. Corn, rice, sweet potatoes, and other vegetables are the principal food crops. In the foreign trade of Guam for the year ending June 30, 1941, imports were valued at \$999,410, and exports at \$84,278.

CHARLES F. REID.

GUATEMALA. A republic in Central America. Area: 42,042 square miles. Population: 3,450,732 (1943). Capital: Guatemala City.

Guatemala is the northernmost of the Central American republics. Volcanic highlands separate the broad Pacific coastal plain from the low tableland of the north. A hot climate prevails in the lowlands along the Gulf of Honduras on the east, while temperate climates are found in the intermont basins of the highlands.

Government. Guatemala is a centralized republic of 22 departments. A new Constitution signed Mar. 11, 1945, replaced that of 1879. The Constitution provides for a unicameral Congress. Members are elected for 4-year terms but may not serve for 2 successive terms. The two regular sessions of Congress are limited to a total of 6 months a year. The president is elected for a 6-year term and may not be reelected until after a lapse of 12 years. He is assisted by a Cabinet of 7 members. Members of the armed forces may not be elected to Congress or to the presidency. Municipal mayors and councils are chosen by direct popular vote. Dr. Juan José Arévalo Bermejo was elected President in December, 1944, and inaugurated on Mar. 15, 1945.

The People. Over half of the total population of Guatemala are Indians; the rest are chiefly mestizos and persons of European descent. The south and west are the most densely populated areas of the country. The largest cities are: Guatemala City, 162,828; Quexaltenango, 33,500; and Puerto Barrios, 15,800.

Spanish is the official language, but Indian languages are also spoken. Roman Catholicism is the predominant religion.

According to the 1940 census about one-third of the population over 7 years of age is literate. In 1940 there were 2,520 primary schools with a

total of 140,736 students; 69 intermediate schools with a total of 6,552 enrolled; and the National University in the school year 1942-43 had 594 students. The Guatemalan Government in 1945 embarked upon a 4 to 6 year educational campaign, under which every literate individual between the ages of 18 and 60 (except for individuals especially exempted) is required to teach one illiterate to read and write.

National Economy. Guatemalan economy is agricultural; about 90 percent of the population are engaged in farming. In 1940 over 60 percent of the land cultivated was planted to corn, the chief crop and staple food of the country. Beans are another important staple crop. Coffee, bananas, and chicle are important export crops. The 1944-45 coffee crop is estimated to total 1,000,000 bags of clean coffee. It is estimated that Guatemala has a potential production of 724,000 stems of bananas monthly.

There are small pastoral and manufacturing industries. Meat requirements are met by domestic production. Manufacturing consists chiefly of processing agricultural products and of making such items as textiles, leather goods, cement, soap, furniture, etc.

Foreign Trade. The chief export products are coffee, bananas, and chicle. Coffee exports during the quota year 1944-45 totaled 855,170 bags of 60 kilograms each, of which 765,388 bags, or 89.5 percent, were shipped to the U. S.; the remainder went principally to Canada and Switzerland. During 1944 Guatemala exported 4,495,078 stems of bananas, about a 60 percent increase over stems exported in 1943. A total of 3,480,295 pounds of chicle and chiquibul was extracted and shipped during 1944. Exports of honey and beeswax increased in 1944 over the preceding year. In 1942 total exports were valued at 20.4 million dollars, of which the U. S. took 92 percent. Exports to the U. S. from Jan. 1 to Oct. 1, 1945, totaled approximately \$21,500,000. Principal exports in order of value were: coffee, bananas, chicle, lumber, citronella oil, hand-woven Indian textiles, and lemon-grass oil.

In 1942 the U. S. provided 71 percent of total imports into Guatemala. Manufactured articles constitute the principal import items, with some raw materials and foodstuffs.

Events, 1945. A Constituent Assembly opened in Guatemala on Jan. 10 to draft a new constitution which would embody the principles of the October, 1944 revolution. The Constitution was published on Mar. 11. It preserved most of the main features of Guatemala's traditional frame of government, as embodied in the Constitution of 1879 with its amendments of 1887, 1897, 1927, and 1935, but it enlarged the base of citizenry upon which that government rested, and it broadened and strengthened the protection guaranteed by law to all Guatemalans. At the same time it reinforced throughout the governmental structure prohibitions and precautions designed to frustrate any future attempts at prolonging a presidency in the manner that had led Guatemala into dictatorships in former years. The keynote of the new Constitution was sounded in Article I, which repeated the old Constitution's opening statement that Guatemala is "free, sovereign, and independent," but amplified it to describe Guatemala as "a republic organized for the primary purpose of ensuring for its inhabitants the enjoyment of freedom, education, economic welfare, and social justice."

On Feb. 7 the Constituent Assembly decreed that Juan José Arévalos had been elected President.

He was sworn in on Mar. 15—the first popularly elected chief executive in 14 years—for a six-year term, at a ceremony attended by special diplomatic missions from 21 countries. In his acceptance speech, Arévalos strongly advocated the restoration of a Central American federation, pledged Guatemalan aid against tyranny, recommended that the American nations agree not to recognize undemocratic governments, promised autonomy of the judiciary and non-partisan government, and emphasized the necessity of greatly increased educational opportunities. On Mar. 18 Arévalos announced his Cabinet, which included three members of the 1944 Junta Cabinet and one member of the Junta itself: Captain Jacobo Arbenz as War Minister. A second member of the Junta was added to the Government on Mar. 22, when Guillermo Toriello was named Foreign Minister.

Starting before the inauguration of Arévalos, and continuing throughout the year, the new Government was engaged in liquidating the Ubico-Ponce dictatorship and stamping out its remnants.

On Jan. 23, the Junta had ordered a return to the Treasury of \$200,000 awarded to Ubico in 1940 by the National Assembly, and said that if he failed to repay within 30 days, assembly and cabinet members responsible for the act would have to repay the sum. A few days later, the Government demanded repayment of \$500,000 pension and salary given to Ubico. When no repayment was made, action was started early in March to confiscate Ubico's property in the country. On Apr. 13, the Government canceled titles and returned to the government domain 6,000 acres of land which had been given to Ubico. On Nov. 25, Congress approved a law expropriating the assets and equipment of an airline of which Ubico had been part owner. And on Nov. 28 the sale and transfer of two plantations to the wife of the former dictator were voided.

As early as Feb. 11, the Junta had arrested eight oppositionists, including all leaders of Adrian Recinos's Democratic Party, on charges of "conspiring against democratic institutions." Recinos himself, former Ambassador in Washington and a defeated candidate in the 1944 presidential elections, was ordered to leave the country or be arrested.

By early April, the political situation had become tense; it was said that a reactionary conspiracy was trying to unseat the Arévalos Government. There were numerous arrests and deportations, and on Apr. 9 Congress suspended the civil rights articles of the constitution for 30 days, retroactive to Apr. 4. The suspended guarantees were automatically reestablished in May. But late in that month the discovery of another conspiracy was announced. On June 8 Arévalos declared that it was necessary for him to reorganize his Cabinet to include men in whom he had personal confidence. There were more arrests in the middle of June. On June 19 the President prohibited further activities of three political parties: Democrat, Central Democrat, and Democratic National Front.

On Oct. 2 the Cabinet again suspended constitutional guarantees for 30 days (the period was later extended to 60 days); it declared that supporters of the former Ubico and Ponce dictatorships were plotting the overthrow of the Arévalos regime. Once again there were arrests and deportations, and Mexican authorities arrested a group of Guatemalan exiles living near the border who were said to be plotting against their Government.

As the year ended, the tension seemed to be eased: Constitutional guarantees were restored in

November and it was announced that many political prisoners had been released. The Government was able to turn its full attention to the rising prices and food shortages which were at least partly responsible for unrest; to measures of health improvement and labor betterment; and to a national campaign against illiteracy.

Foreign Relations. The foreign relations of Guatemala in 1945 were notable for a revival of the old dispute with the United Kingdom over ownership of Belize (British Honduras). One article of the new Constitution declared that "Belize is an integral part of the Guatemalan territory." Britain protested, and Guatemala rejected the protest as an "offense." It declared, however, that the issue would not be pressed until the war was over. Then, on Sept. 27, Guatemala notified Britain that it intended to reopen the matter, and on Oct. 11, it proclaimed that all British Honduran nationals were Guatemalan citizens. The British again protested, and on Dec. 28 Guatemala once more formally rejected the protest.

Diplomatic relations with the Franco Government of Spain were broken on Jan. 22, and on Sept. 10 the Spanish republican Government-in-exile was recognized.

Guatemala established diplomatic relations with the Soviet Union on Apr. 19.

HARRY B. MURKLAND.

GUGGENHEIM MEMORIAL FOUNDATION, The John Simon. A foundation created in 1925 by Simon Guggenheim and his wife as a memorial to a son who died at the age of 18. The original endowment was \$3,000,000 enlarged to \$7,000,000 by 1939, and further increased upon the death of Simon Guggenheim in 1941. In fulfilling its purpose to "promote the advancement and diffusion of knowledge and the appreciation of beauty" the Foundation awards Fellowships, normally \$2,500 a year, to citizens of the United States, Canada, and certain Latin American countries. Since its establishment the Foundation has granted 1,539 Fellowships with stipends totaling \$3,215,260. In the year 1945 the Foundation granted 154 Fellowships with stipends totaling \$352,125.

GYMNASTICS. Penn State College regained the national A.A.U. championship, but only after the closest type of competition from the Swiss Gymnastic Society of Union City, N. J., in the annual tournament held at Jersey City. Despite the Herculean efforts of Frank Cumiskey, who won five individual titles for the Swiss Society, the final tally found his team with 60 points and the collegians with 60%.

Cumiskey, a member of the 1936 Olympic squad, triumphed on the long horse, side horse, parallel bars, horizontal bar and took all-around honors.

Miss Clara Schroth, Philadelphia stenographer, stole the show in the women's meet, the versatile star of the Philadelphia Turners taking three titles and tying for another.

THOMAS V. HANEY.

HAITI. A West Indian republic. Area: 10,700 square miles. Population: 2,719,474 (1942). Capital: Port-au-Prince.

Over 80 percent of the surface of Haiti is mountainous. Lowlands along the northern coast are moist, while the lowlands in the west are semi-arid. An elevated basin forming the Plaine Centrale lies adjacent to the southern margin of the Cordillera Central, and between the Cordillera and the mountains of the southern peninsula is a deep depression

known as the Cul de Sac. High temperature and excessive evaporation lower the effectiveness of the rainfall. The climate in centers of population is warm, generally pleasant, and healthy.

Government. Under the Constitution of 1935 Haiti is a centralized republic of 5 departments. It has a bi-cameral National Assembly: a Senate of 21 members, and a Chamber of Deputies of 37. The President is elected for a 5-year term and is aided by a Cabinet of 5 ministers. President Elie Lescot was elected on Apr. 15, 1941.

The People. The population of Haiti is concentrated along the northern and southern coasts. About 95 percent is Negro, the remainder chiefly mulatto. The leading cities are: Port-au-Prince, 115,000; Cap-Haitien, 12,000; and Aux Cayes, 11,900.

French is the official language, but most of the people speak Creole French. The predominant religion is Roman Catholic.

It was estimated in 1944 that about 8 percent of the population over 10 years of age is literate. In 1941, 85,000 pupils received primary instruction in 835 schools; 35 intermediate schools had a total of 5,768 students, excluding normal school enrollment, and six institutions of higher education had a total of 236 students. Under a recent reorganization, higher education will be offered in private and special schools organized by the state or under state auspices, in addition to that available at the University of Haiti.

National Economy. Agriculture is the basis of Haitian economy. The most important crops are coffee, cotton, sugar, sisal, bananas, and cacao. Haiti's annual coffee crop averages 31,000,000 kilograms. In 1945 molasses production totaled 2,374,183 gallons, most of which was shipped to the U. S.; sugar production reached 50,266 short tons. In recent years there has been intensive development of the sisal industry, and production was expected to reach about 10,000 metric tons in 1945. Ginned cotton production in recent years has averaged about 2,727 metric tons.

Mineral resources of Haiti have not been developed, but are reported to be extensive. Manufacturing is confined chiefly to processing of coffee, sugar, and sisal, with some soap and tobacco products. A handicraft industry of some importance has been developed in recent years.

Foreign Trade. Haiti's total foreign trade in 1944 was valued at \$31,826,000, the highest recorded since the late 1920's. Exports in 1944 were valued at \$15,786,000. Of the total value, the U. S. took 67.3 percent; the United Kingdom 11.7; Canada 10.5; Colombia 5.4; Switzerland 1.9; Cuba 1.1. Banana exports for 1944-45 totaled 4,104,825 stems valued at \$2,506,931. The entire 1944-45 sugar export totaling 32,651 metric tons, was shipped to the United Kingdom, under the International Sugar Agreement. Exports of coffee for 1943-44 totaled 23,116,197 kilograms, valued at \$5,196,765. Exports in 1944 of sisal totaling 7,985 metric tons were valued at \$1,381,089; of cotton totaling 3,733 metric tons, at \$962,616; of cacao totaling 1,341 metric tons, at \$205,341.

Haitian imports in 1944 were valued at \$16,040,000, of which the U. S. supplied 70.8 percent; Mexico 14.8; Argentina 3.8; Curacao 2.8; India 2.4; Cuba 1.9; Canada 1.6; and the United Kingdom 1.4. Principal imports were: cotton textiles, foodstuffs, manufactured products, chemicals and pharmaceuticals, iron and steel products, and fuel and lubricating oils.

Events, 1945. On June 4 President Elie Lescot of Haiti branded reports of Haitian-Dominican ten-

sion as "insane propaganda," and declared that "there is no conflict between Haiti and any other country of the continent." But on June 16 military censorship was established throughout the republic, after the Government had uncovered "certain doings taking place outside of Haiti, the purpose of which is to hamper public order here and the good reputation of this country."

Bert Hicks, special correspondent of the New York newspaper, *PM*, revealed in San Juan, Puerto Rico, on Aug. 6 that the Haitian consul there had officially notified him he would not be allowed to enter Haiti in the future. The reason was said to be an article, published in *PM* on June 6, in which Hicks had implied that the Presidents of Haiti and the Dominican Republic had signed a secret treaty in which Haiti agreed to cede certain territory to its neighbor.

The Government announced officially on Aug. 12 that two men, said to be newspapermen, who had been sentenced on Mar. 1, had been executed for an attempt to assassinate the President. The police reported also that five other persons had been arrested on charges of distributing leaflets attacking the Government.

The Government announced on Aug. 26 that "by order of the President, censorship on all letters, cablegrams, and radiograms from abroad is abolished effective Aug. 25, also that military censorship established on all local correspondents is abolished."

But two days later it was reported that several Haitian journals had been suppressed and that nine journalists, including the editors of the suppressed papers, had been jailed and a tenth exiled.

On Oct. 28 a committee for Haitian democracy petitioned President Truman to demand the restoration of a democratic regime in Haiti.

HARRY B. MURKLAND.

HANDBALL. Seaman Joseph Platak, rated the greatest handball player of all time, returned to his home courts at the Lake Shore Club in Chicago last spring and regained the national A.A.U. four-wall softball title he had held for eight straight seasons prior to his setback in the 1944 tourney. Meeting Frank Coyle of the New York A.C., his conquerer the year before, Platak fell behind at 10-5 in the first game, but fought back to triumph by 21-19, 21-8.

Sam Atcheson and Ed Dettwiller of Memphis, Tenn., were the doubles winners in the only tournament of major importance held in 1945.

The sport continued to flourish on beaches and club courts of the New York area. George Gluckler and Harry Michitsch, both members of the Trinity Club, shared first place on the official A.A.U. ranking list for the metropolitan district.

THOMAS V. HANEY.

HAWAII, Territory of. A territory of the United States, composed mainly of the eight inhabited islands of the Hawaiian Island group, in the North Pacific Ocean and within the tropics. Honolulu, the capital, is located on Oahu Island, 2,408 miles from San Francisco. The islands that form the Territory have a combined area of 6,407 square miles.

Government. The head of the Territorial Government is Governor Ingram M. Stainback, who holds office by appointment of the President of the United States for a term of four years. The registered voters of the Territory elect quadrennially 15 Senators and biennially 30 Representatives, constituting the Legislature. This body passes appropriations and other acts within the Territorial

authority. The popular vote elects to each U.S. Congress a Delegate (Joseph R. Farrington), with a voice, but no vote, in the House of Representatives.

Events, 1945. With the influx of civilian defense workers, approximately 65,000, into the Territory, the housing shortage became acute. It was estimated by the Governor's Advisory Committee on Housing that there was a shortage of 21,275 dwelling units in Honolulu. Between 1940 and 1945 the population of Hawaii increased from 423,000 to 502,000 or about 19 percent.

Territorial Delegate, Joseph R. Farrington, introduced a bill proposing that the U.S. Congress authorize the people of Hawaii to take the necessary steps to qualify as a State of the Union. The Territorial Legislature adopted resolutions at the 23rd biennial session in support of Statehood and Congressional action. Secretary of the Interior Ickes went on record in support of Statehood for Hawaii.

The 10 P.M. curfew which had been in effect since Dec. 7, 1941, was ended on July 7 by Lt. Gen. Robert C. Richardson, Jr., Commanding General of the mid-Pacific area. The curfew prohibited anyone remaining on the streets between 10 P.M. and 5 A.M. without special permission. Shortly thereafter, Executive Order 9489 terminated the designation of Hawaii as a military area in which the military commander could exercise certain powers.

Although there have been numerous clashes between servicemen and civilians none reached riotous proportions until November 12 when 750 sailors of the Honolulu Naval Air Stations armed with clubs, knives, bars, etc. tangled with civilians in the city of Honolulu who were reported to be attacking men in uniform without provocation. An unfounded rumor that two sailors had been killed heightened the fury of the servicemen. Hawaii's Acting Attorney General Rhoda V. Lewis who conducted a thorough investigation of the riot stated that the responsibility for this incident and other clashes rested equally between servicemen and civilians.

In spite of the fact that there had been 8 previous Pearl Harbor inquiries another investigation was authorized by Congress. The new Pearl Harbor Investigating Committee consisted of 10 members of Congress, 6 Democrats and 4 Republicans. Senator Alben W. Barkley (D) was Chairman and William D. Mitchell was in charge of the legal staff. Hearings started on Nov. 15 and were to end on Jan. 3, 1946, when a final report was to be filed, according to a joint resolution of Congress. Prominent witnesses included Gen. George C. Marshall, Chief of Staff; Adm. James C. Richardson, former commander, U.S. Fleet; Maj. Gen. Shuman Miles, former head of Army Intelligence; and Lt. Gen. Leonard T. Gerow, Chief of the War Plans Division. Realizing that the hearings could not be concluded by Jan. 3 and that the nature of the questioning by members of the Committee was not always relevant to the inquiry, the entire legal staff tendered their resignations to Chairman Barkley on Dec. 14. Later the hearings were recessed for the holidays from Dec. 21 to Dec. 31. The life of the Committee was extended from Jan. 3 to Feb. 15, 1946, and all members seemed determined that no further extension would be necessary.

The People. The population of Hawaii as of Apr. 1, 1940, was 423,330, as compared with an estimated population of 465,339 on June 30, 1941. There were 387,197 citizens (139,299 Caucasians,

124,351 Japanese, 52,445 part-Hawaiians, 24,886 Chinese, 18,050 Filipinos, 8,460 Puerto Ricans, 4,628 Koreans, and 832 others), as compared with 78,142 non-citizens (35,183 Japanese, 34,010 Filipinos, 4,351 Chinese, 2,328 Caucasians, 2,253 Koreans and 170 others). Prior to the war the ratio of males to females was 2 to 1, but after Pearl Harbor the ratio increased to 150 to 1. In 1941 Honolulu had 200,158 inhabitants.

In addition to the University of Hawaii there are 196 public schools (12 high schools, 17 intermediate, 145 elementary, and 22 vocational and miscellaneous) and 121 private schools (elementary through college) on the islands.

Economy. The three leading industries are the tourist trade, sugar and pineapple. Although the tourist industry had been seriously handicapped by the war it was soon revived by the resumption of commercial air and steamship services. Hawaii had 94 modern hotels located as follows: 70 on the Island of Oahu, 8 on Hawaii, 3 on Kauai, and 13 on Maui. Exports to the United States mainland of Hawaiian products were valued at \$82,618,845 of which unrefined sugar represented \$52,277,853 and canned pineapples \$18,728,401. Imports from the United States mainland were valued at \$185,900,000. Edible animals and animal products, vegetable food products and beverages, and textile fibers and manufactures were the chief commodities imported.

CHARLES F. REID,

HAYDEN FOUNDATION, Charles. A charitable institution, established in 1937 to assist needy boys and young men to attain moral, mental, intellectual, and physical well-being through providing scholarships and aiding educational institutions; through building, assisting, or equipping clubs, gymnasias, and recreation centers; and through aiding hospitals.

The trustees are empowered to use the income or the principal of the fund in the furtherance of other charitable or educational projects as contemplated in Mr. Hayden's will. The will directs that in the disposition of the funds, preference be given to the activities of the Foundation within New York City and Boston, although it also provides that work may extend to other places in the United States.

The Founder was particularly interested in boys' clubs, therefore, the Trustees confine present activities to that work and limit grants-in-aid to organizations operating in New York and Boston. Headquarters of the Foundation are 25 Broad St., New York City.

The Trustees are: J. Willard Hayden, Edgar A. Doubleday, and Erle V. Davelar. The total capital assets are approximately \$45,000,000.

HEATING AND VENTILATING. In one respect 1945 began in the same way it ended—with fuel shortages—although the country at the close of the year was in far better shape than at the beginning. The cessation of war enabled refiners to divert petroleum to fuel oil rather than to gasoline but a shortage of fuel oil in 1946 was predicted by oil men who said that the more favorable price structure on gasoline was detrimental to a full supply of fuel oil. Beginning early in the year and steadily increasing throughout 1945, the demand for (manufactured) gas house heating reached unprecedented heights. This might be accounted for by (1) higher incomes on the part of many who prior to the war could not afford gas; (2) the fact that gas rates have been

constant, while coal and oil costs have increased, and (3) dissatisfaction with the grade and supply of oil and coal and with the servicing facilities for these fuels available during the war years. At any rate the postwar battle for the house heating market began in earnest and with gas in the most favorable position it has ever been, while coal, due to price increase, is in perhaps the least favorable position.

A plant for the manufacture of a combined anthracite and bituminous packaged coal was opened in Philadelphia May 23. The product consists of six 3-inch cubes wrapped and sealed in colored paper, so that the fuel can be handled and thrown in the boiler or furnace without soiling one's hands.

Two outstanding technical developments of the year were (1) a new oil burner head, designed by the Shell laboratories, intended to increase oil burner efficiencies and simplify servicing; and (2) the introduction of the baseboard radiator. The latter is a long low chamber resembling and replacing the conventional baseboard. It is used along one or two walls, has hot water circulated through it, and thus entirely replaces the usual radiator. Advantages include its inconspicuousness so that it does not interfere with room decoration, and a low floor-to-ceiling temperature differential.

A third development concerned radiant heating which heretofore has been almost entirely confined to pipes concealed in the floor or ceiling and carrying hot water. As the result of development work carried on over a period of years, a furnace company has announced a system of house construction employing a false ceiling. Between this and the true ceiling, warm air is circulated. The heated ceiling radiates energy which keeps the occupants warm. The company has licensed 16 manufacturers to design and install such systems. In addition to this, a large copper company made available full technical information for the design of radiant heating systems employing copper tubes. Further headway was made in the art of snow melting by use of pipes underground through which hot water or steam is circulated. One company installed such a system for its new office building sidewalks during the year; several airports are reported as studying the economies of such installations under runways.

Two organizations, John B. Pierce Foundation and Dow Chemical Co., announced progress in their attempts to develop a unit combining all the heat-power functions needed in a house. Dow has a 3,500 kitchen-bathroom unit to supply heat, refrigeration and hot water. Dow-Therm, with a boiling point of over 500°F, is the medium carrying heat energy to various heat exchangers, including an absorption type refrigerator. Pierce Foundation's unit, with the same objective, employs tetracresyl silicate with a boiling point of 817°F. Both of these units will be, presumably, self-contained packages ready for installation.

A study of heat losses through the floors of basementless buildings was completed by the National Bureau of Standards. This investigation was made because of the widespread use of basementless designs in low-cost housing. The Bureau showed that the heat loss could be decreased by insulating the edges or periphery as this is where most of the heat is lost.

Purdue University announced a full-scale experimental study of solar houses, to determine how much of the sun's heat can practically be used for heating a building. Two identical houses except

for glass (one has the customary wall-to-glass ratio, the other is two-thirds glass on the south wall) are being tested this winter to determine the relative cost for equivalent comfort in the two houses. A Canadian glass company constructed, during the summer, a solar house in Toronto with the same general objective as those of the Purdue study.

American Gas Association reported research on kitchen ventilation. The findings showed that hoods over stoves were highly desirable in carrying away moisture and in confining odors to the kitchen. TVA issued a handbook on hay drying, primarily devoted to use of ventilation to carry away moisture. Studies on hay drying continued at numerous agricultural research centers, with, in certain places, emphasis on use of supplementary heat.

CLIFFORD STROCK.

HECKSCHER FOUNDATION FOR CHILDREN. An organization founded by August Heckscher (1848-1941) to promote the welfare of children. The Foundation was incorporated March 15, 1921, and occupies a building at 346 West 89 Street, New York 24. It maintains benevolent, educational, recreational, and welfare activities. It specializes in a cultural program for children including art, singing, piano lessons, tap dancing, ballet dancing, interpretative dancing, creative dramatic arts, children's theatre production group and Heckscher Children's Symphony Orchestra composed of fifty young musicians from the ages of seven to seventeen.

Dramatic productions are given three times a year at holiday time, a program of Ballet Divertissement in June and a Concert by the Symphony Orchestra every eight weeks. All these performances are given at the Heckscher Theatre, Fifth Avenue at 104 Street and are open free to the public.

HOCKEY. Toronto, which could place no better than third in the National Hockey League race, scored one of the biggest upsets in recent years when it fought its way through the play-offs to capture the Stanley Cup, emblematic of world supremacy in the sport.

Sparked by the brilliant goal-tending of Frank McCool, a former sports writer and Canadian Army dischargee, the fast-skating Maple Leafs turned back a rugged Detroit sextet by 4 games to 3 in the cup finals.

McCool, who received the Calder Trophy as the league's outstanding rookie of the year, shut out the Red Wings, 1-0, 2-0 and 1-0, only to have Detroit come roaring back to tie the series with triumphs by 5-3, 2-0 and 1-0. Then in the thrilling seventh battle, the veteran Babe Pratt tallied on a great shot near the close to give the Leafs a 2-1 decision and the prized cup.

Toronto had served notice that it was a fighting outfit when it took the measure of the Montreal Canadiens, champions in the regular league race and defenders of the Stanley Cup, in the semi-final round. Detroit recorded a mild surprise by eliminating Boston's Bruins in the penultimate round.

Although play in general during the campaign fell far below that of the prewar era in quality, the league's attendance again swung sharply upward all around the circuit.

Individual scoring honors were captured by Elmer Lach of Montreal, who tallied 80 points on 26 goals and 54 assists. Lach also won the Hart Trophy, awarded annually to the National League player voted most valuable to his team, while Bill Durnan, also of Montreal, annexed the Vezina

Trophy for the second straight season, the prize being given to the goalie whose team is least scored against during the regular campaign.

The Seattle Ironmen, Western kings, carried off national amateur honors by conquering the Boston Olympics, Eastern League champions, 4 games to 2, while laurels in the American League went to the Cleveland Barons when they turned back the Hershey (Pa.) Bears in four out of six contests. The Jamaica Hawks triumphed in the Metropolitan League and the St. Michael's College Majors of Toronto annexed the Canadian junior crown.

THOMAS V. HANEY.

HONDURAS. A Central American republic. Area: 59,161 square miles. Population: 1,201,310 (1945). Capital: Tegucigalpa.

The land surface of Honduras is largely mountainous, except for the southern coastal lowland and a few deep river valleys in the north. Most of the settled areas in the highlands range from 3,000 to 4,500 feet in elevation. The northern half of the country is wet and tropical; the south and southwest have tropical dry-winter climate.

Government. The Constitution of 1936 provides for a centralized republic of 17 departments and 1 territory, and a unicameral National Congress of 45 members. The Congress meets in regular session on Dec. 5 each year for 60 to 100 days. The President and members of Congress are directly elected for 6-year terms, and the President may not succeed himself in office. He is aided by a Cabinet of 6 ministers. General Tiburcio Carias Andino became President in 1933 for a 4-year term which was extended to Jan. 1, 1943, and later to Jan. 1, 1949, by constitutional amendment.

The People. About 86 percent of the total population of Honduras are mestizos; the rest are divided among Indians (9 percent), Negroes (2.2 percent), and persons of European descent (1.8 percent). The Indians live in the highlands; the negroes on the north coast. Highest population density is in the southwest. The largest cities are Tegucigalpa, 47,200; San Pedro Sula, 20,400; and La Ceiba, 11,300.

Spanish is the official language, Roman Catholicism the prevailing religion.

It is estimated that 52.2 percent of the persons over 7 years of age are illiterate. In 1942 there were 55,567 students in 1,083 primary schools; 2,544 students enrolled in 18 intermediate schools; and 378 students in the Central University.

National Economy. Honduras has an agricultural economy. The chief export crops are bananas and coffee. Other export crops are: tobacco, citrus fruits, coconuts and copra, citronella, and loofa sponges. Production of abacá was begun in 1944. Domestic food crops include: corn, beans, and rice. Cattle-raising supplies meat for the domestic market and the most important export to countries other than the U. S. Honduras also exports forest products, chiefly mahogany, pine, crude rubber, liquidambar and turpentine. Gold and silver are the most valuable mineral exports.

Small manufacturing establishments supply the domestic market with such articles as cotton goods, yarns, cigarettes, matches, soap, and candles.

Foreign Trade. Honduran exports and imports attained almost prewar levels in 1943-44, merchandise trade being valued at \$21,690,477. The total value of exports was \$9,462,532, of which bananas and precious metals accounted for 71 percent. More than 85 percent of total exports for 1943-44, valued at \$8,081,003, were shipped to the U. S. During 1944, banana exports totaled 10,359,159 stems, an

increase of 69 percent over 1943; shipments of dried and powdered bananas totaled 444,286 pounds; coffee exports to the United States amounted to 5,239,047 pounds, and to other countries (Mexico and British Honduras) 813,058 pounds. Other significant export items for 1944 were: gold bullion valued at \$791,429; 32,556 pounds of citronella oil; 63,089 pounds of loofa sponges; 13,641,001 coconuts.

The value of merchandise imports during the fiscal year 1943-44 totaled \$12,227,944, the highest since 1929-30, but the volume in kilograms was about 25 percent below the average for the last five prewar years. The U. S. supplied imports valued at \$7,776,972, or about 64 percent of the total; El Salvador provided about 13 percent, and Mexico 10 percent. In 1941-42 manufactured goods amounted to 72 percent of total imports, raw materials 16 percent, and foodstuffs and beverages 11 percent.

Events, 1945. Honduran relations with Guatemala and El Salvador were strained, as Honduran exiles used those countries as bases for propaganda and action against the Administration of President Tiburcio Carias Andino. Julián R. Cáceres, Ambassador in the U. S., denied on Jan. 9, however, that Guatemalan military men were in Honduras plotting against their own Government, and he asserted that Honduras wanted to "live in peace and harmony with its neighboring countries." On Jan. 28 Carias declared that he held no rancor against neighboring countries from whose territories armed forces had attacked him in 1944, and many students and soldiers who had fled after the unsuccessful rebellion were said to be returning.

Then, on Apr. 15 a well-armed band of some 300 exiles invaded the northern Honduran state of Copán from Guatemala and attacked local garrisons. They scored initial successes and the fighting went on for some time. But eventually government forces routed the invaders and killed most of them.

By the middle of June, oppositionists were returning to Honduras from Guatemala and El Salvador, in response to the President's promise not to take action against them. Several prisoners charged with "activities against peace and order" were released early in November. The wartime state of siege and suspension of constitutional guarantees were terminated on Dec. 18, and all political and military prisoners were said to have been freed by Dec. 25. The situation in Honduras continued unsettled but it appeared that Carias had strengthened his position because of lack of unity among his opponents.

The National Congress adjourned on Mar. 13, after having approved a series of wartime measures, including: exclusion of Italian funds from "freezing" orders; regulations for obligatory transfer of Axis assets to Honduran nationals; appropriation of funds to fulfill international obligations; and approval of three contracts for local air transport.

HARRY B. MURKLAND.

HOSPITALIZATION, Federal Board of. An advisory Board of the U. S. Government, organized in 1921 to coordinate the hospitalization activities of the medical branches of the Army and Navy, the U. S. Public Health Service, the U. S. Veterans' Administration, St. Elizabeth's Hospital, and the Commissioner of Indian Affairs. On May 7, 1943, it was also designated as an advisory agency to the Bureau of the Budget. It has been charged with the development of a complete over-all program for providing hospitalization for the veterans of World War II. Chairman in 1945: Gen. Omar N. Bradley.

HOWLAND ISLAND. A mid-Pacific island (0° 49' N. and 176° 40' W.), belonging to the United States. It lies athwart the main steamship lanes and the Pan American Airways route from Honolulu to New Zealand and Australia. An aerological station was established during 1936 by the U.S. Dept. of the Interior.

HUMAN NUTRITION AND HOME ECONOMICS, Bureau of. A Bureau of the U.S. Department of Agriculture, established as the Office of Home Economics in 1923. To meet the demand of American families for scientific facts to aid them in the best use of their resources, the Bureau conducts research on food, fiber, and other products of agriculture contributing to everyday living, and on economic problems that affect rural family living. Chief: Hazel K. Stiebeling.

HUNGARY. A state in central Europe. Area: 35,875 square miles (1938 estimate). Population: 9,106,252 (1938 estimate). Chief cities (with Nov. 9, 1939, population figures): Budapest (the capital) 1,115,877, Szeged 131,893, Debrecen 122,517, Kolozsvár 100,844, Kecskemét 83,732, Nagyvárad 82,687, Miskolc 73,503, Ujpest 72,940.

Education and Religion. See YEAR BOOK for 1944.

Production, Foreign Trade, etc. For Hungary's economic situation before and during World War II see YEAR BOOK for 1944, *Statistical Year-Book of the League of Nations*, 1942/44, and *Foreign Commerce Weekly*, Mar. 17 and 31, 1945 (U.S. Dept. of Commerce, Washington, D.C.).

Finance. Budget estimates (1944, including estimates of revenue and expenditure for annexed territories which were evacuated by Hungary on Jan. 20, 1945): revenue 5,866,700,000 pengő; expenditure 6,147,100,000 pengő. The public debt increased from 1,937,400,000 pengő on June 30, 1939, to 6,501,000,000 pengő on Dec. 31, 1943. For the year 1944 the service of the public debt required 363,800,000 pengő. It was reported in the press that notes in circulation totaled 106,000,000,000 pengő on Oct. 30, 1945.

Events, 1945. The early weeks of 1945 brought to Hungary the cruel consummation of the tragedy implicit in the acts of the Horthy Regency. By aiding the Reich to despoil Czechoslovakia after Munich, signing the Anti-Comintern Pact (Feb. 24, 1939), joining the Fascist Triplice (Nov. 20, 1940), participating in the Nazi invasion of Yugoslavia (Apr. 6, 1941) and following Hitler in waging war on the U.S.S.R. (June 27, 1941) and the United States (Dec. 13, 1941), the Magyar feudal elite condemned itself to destruction and its country to disaster.

The year opened with Soviet armies besieging Budapest, while the Provisional Government of Col. Gen. Bela Miklos de Dalnok at Debrecen declared war on Germany (Dec. 30, 1944) and asked the Allies for an armistice (see YEAR BOOK for 1944, pp. 279-81). It was revealed early in January that Horthy's confidential agents had signed a secret armistice on a motor boat in the Bosphorus on Sept. 9, 1943, with Sir Hughe Knatchbull-Hugessen, British Ambassador to Turkey. This early effort to get out of the war, like its later counterparts, had failed for military reasons. Only with the Wehrmacht smashed and most of the kingless kingdom occupied by the Red Army did peace become possible.

On January 20 an armistice was signed in Moscow by Marshal Klementy Voroshilov for the U.S.S.R., the United States, and Great Britain on the one side and by Foreign Minister Janos Gyoen-

gyoessy, Defense Minister Col. Gen. Janos Voeroes, and Istvan Balogh for the Hungarian Provisional Government (text in *New York Times*, Jan. 22, 1945). Its terms amounted to "unconditional surrender." Hungary placed its armed forces at the disposal of the Allies, accepted its 1937 boundaries and agreed to pay \$300,000,000 in reparations in kind over a six-year period, with the Soviet Union to receive two thirds of the total. Of the balance, \$70,000,000 was to go to Yugoslavia and \$30,000,000 to Czechoslovakia under subsequent agreements.

The agony of Budapest ended on February 13 after fifty days of siege operations and street battles. The Wehrmacht and its Magyar Fascist allies lost 160,000 in killed and captured. The handsome capital, which the Nazi High Command had vainly sought to turn into "another Stalingrad," suffered grievous devastation, though it was not quite the "heap of rubble" of which German propagandists boasted. With the rapid expulsion of the broken enemy from the northwestern provinces, a bleeding Hungary sought to bind up its wounds and begin a new life.

Sic Transit Gloria. Late in April the aged Nicholas Horthy was captured in Bavaria, Germany, by the American Seventh Army. On May 4 he disclosed a letter which he had written to President Truman asking that he be "listened to" at the peace conference, blaming the Treaty of Trianon and the Nazi Reich for all of Hungary's woes, and repeating the hoary fiction that "we had no aspirations outside our own borders but sought only to keep Bolshevism out of our country." Other relics of the past fell into American hands, including fifty carloads of jewelry, rare furniture and rugs shipped to Germany to escape the Red Army, the Hungarian crown jewels, and \$800,000,000 in bullion of the Hungarian National Treasury.

Horthy was released from protective custody at the end of the year. Whether he would later be indicted and tried as a war criminal was uncertain. Pro-Nazi and anti-Semitic Bela Imredy, who had resigned the premiership on Feb. 15, 1939, on discovering that he had "Jewish blood" and had later sanctioned the slaughter of several hundred thousand Jews as a member of the Sztotjay Cabinet, was turned over to the Hungarian government by American authorities. On November 23 he was sentenced to be hanged for treason, as was Laszlo de Bardossy. The latter was hanged, Jan. 10, 1946, in Budapest.

Of greater import than the fate of individuals was the fact that Hungary's thousand-year-old landed aristocracy was swept into oblivion in the aftermath of the catastrophe. In bringing their nation to ruin, the magnates who had perpetuated feudalism on the Danube through many vicissitudes encompassed their own ruin as a ruling class. With Soviet encouragement, the Provisional Government lost no time in confiscating the great estates and partitioning them among the peasants. This program, always urged by the Social Democrats and Communists, was no less dear to the more conservative Small Landowners Party of Zoltan Tildy and Foreign Minister Gyoengyoessy, many of whose leaders had long suffered persecution at the hands of the nobles. Whatever social changes the future might bring, Hungary's ancient gentry was lost beyond hope of restoration. By mid-summer some 14,000,000 acres had been distributed among 700,000 farm workers, with confiscation the rule for fascist landowners and war criminals and partial compensation for the rest.

East vs. West. Throughout the year Hungary re-

mained under Soviet occupation and became a bone of contention, albeit ultimately a source of concord, between the U.S.S.R. and the Atlantic Powers. Voroshilov became chairman of the Allied Control Commission in Budapest. In Hungary, as elsewhere, the conduct of Soviet troops was not calculated to enhance the popularity of the Soviet Union and its local sympathizers, although disciplinary measures were sufficiently tightened by midsummer to put an end to the worst abuses. The role of the Red Army, however, served to discredit the Communist Party which shared power in the Mtklos coalition with the Social Democrats, the Peasants and the Small Landowners.

Friction over Hungary among the Super-Powers centered on preparations for a general election and on Magyar-Soviet economic relations. When the parties of the coalition, under Soviet pressure, agreed to present a joint list of candidates, Bevin and Byrnes indicated that they regarded such an arrangement as wholly "undemocratic" and that their governments would not recognize any regime resulting from such an election. On August 29 the balloting scheduled for September was postponed. Further frictions were engendered at the London Conference of Foreign Ministers. Repeated allegations were made in Great Britain and the United States that Moscow was imposing a "new totalitarianism" in Hungary. No such intention, however, was visible in the conduct of Marshal Voroshilov and in the policies of the Kremlin. On September 29 the U.S. State Department announced its readiness to recognize the Hungarian Government, following receipt of a note of September 25 (in reply to an inquiry of September 22, delivered by H. F. Arthur Schoenfeld, U.S. representative in Budapest), guaranteeing freedom of political expression to democratic groups, rights of assembly and untrammelled elections.

Anglo-American recognition hung fire however for another month. On October 7 municipal elections in Budapest resulted in a striking victory for the Small Landowners. An agreement of mid-October for a joint election list between the Small Landowners and the Communists provoked further resentment in London and Washington and was attributed in some quarters to Voroshilov's influence. On October 23, however, it was announced that the four major parties would submit separate lists, but would continue a coalition regime regardless of the election results. On November 2, two days before the voting, the U.S. State Department extended recognition by accepting Kladar de Szegedy-Maszak as Hungarian Minister.

Soviet-Magyar Trade Parleys. Meanwhile London and Washington took vigorous exception to a five-year trade agreement initialed in late summer by Budapest and Moscow. It provided for the establishment of a Hungarian-Russian Trading Company to develop Magyar enterprises in iron and steel, oil, aluminum, coal, power, chemicals, machinery, shipping and transport, with each government supplying half of the capital. The pact was signed in October, subject to approval by the Allied Control Commission and ratification by the signatory states. While the text was not published, it was alleged by Western critics to pave the way for Soviet control of Hungarian economy. On October 13 the U.S. State Department, seconded by the British Foreign Office, made representations to Moscow against the pact on the ground that its bilateral character was a departure from the Yalta accord for joint action by all three Powers in liberated and occupied territory.

Elections: The Tildy Cabinet. On November 4 Hun-

gary's voters chose a new parliament. The campaign was embittered by the controversies among Washington, London, and Moscow and by the action of Primate Joseph Cardinal Mindszenty on election eve in distributing a pastoral letter characterizing the agrarian program as "an act of vengeance against the landowners." There was no Soviet pressure. The election was in fact the freest which Hungary had enjoyed in many decades. The Small Landholders won 59 percent of the popular vote and 191 seats, the Communists 17 percent and 54 seats, and the Social Democrats 18 percent and 52 seats.

Baron Zoltan Tildy, a Calvinist clergyman and successor to Tibor Eckhardt as leader of the victorious party, denied that Voroshilov had urged either a united list or a postponement of the elections. The new Cabinet was constituted as follows: Premier—Zoltan Tildy, Small Landholders; Foreign Minister—Janos Gyoengyoessy, Small Landholders; War—Eugen Tombor, Small Landholders; Finance—Ernest Gero, Communist; Justice—Dr. Stefan Reisz, Social Democrat; Commerce—Alexander Ronai, Social Democrat; Industry—Antal Ban, Social Democrat; Education—Desider Kereszthury, Peasant Party; Food—Karoly Baranyes, Small Landholders; Reconstruction—Antal Jozseg, Small Landholders; Communications—Imre Nagy, Communist; Welfare—Erik Molnar, Communist.

Toward a Peace Treaty. Premier Tildy indicated that his government would ask a moratorium on reparations payments on the ground that currency inflation and general impoverishment made fulfillment of the armistice terms impossible. On the day after the election the United States informed Budapest that it regarded the proposed Soviet-Hungarian trade agreement as incompatible with the most-favored-nation clause in the American-Hungarian commercial treaty of 1925. The issue, declared Tildy, "is no longer a matter for Hungary to decide." The Hungarian-Russian Trading Company was dissolved in December. But the broad problems of importing foreign capital and restoring foreign trade, both of which depended upon Moscow in the absence of any Anglo-American program of Hungarian reconstruction, were still unsolved at the close of the year.

These and other questions vital to the Hungarian future hinged upon the conclusion of a peace treaty. The procedural deadlock at London in September delayed action, but the Moscow Conference of December 16-26 resulted in agreement that the Powers signatory to the armistice should draw up a peace treaty, to be submitted for discussion to a gathering of 21 states not later than May 1, 1946, and to be put in final form by the Big Three. Hungary's fate, like that of Italy, Rumania and Bulgaria, thus depended more than ever on concord or discord among the Super Powers. If Soviet concessions to the Western view of democracy should be matched by Western recognition that Hungary must inevitably remain within the strategic and economic orbit of the U.S.S.R., it seems probable that a peace treaty will be signed in 1946 and that Hungary will be enabled to take the road toward economic recovery in a social context which for the first time offers promise of some tangible measure of freedom and self-fulfillment for the mass of the Magyar people.

See CZECHOSLOVAKIA, GERMANY, RUMANIA, UNION OF SOVIET SOCIALIST REPUBLICS.

FREDERICK L. SCHUMAN.

ICELAND. An island republic in the North Atlantic, situated 200 miles east of Greenland and about

540 miles northwest of Scotland; occupied by Anglo-American forces since May 10, 1940, for the duration of the war. Area, 39,709 square miles only one-fourth of which is habitable. Population in 1941, 121,618 (excluding Anglo-American forces). Populations of the chief towns: Reykjavik (capital), 70,902 inhabitants in 1942; Akureyri, 5,644; Hafnarfjörður, 3,783.

Government. The Constitution of May 18, 1920, (amended in 1934 and 1941) provided for a constitutional monarchy. The King of Denmark exercised executive power through a responsible Cabinet. Legislative power rested conjointly with the King and the Althing, the oldest parliament in the world, established 930 A.D. The Althing consists of 52 elected members. One third of its members are elected to the upper chamber by the whole Althing; the other two-thirds form the lower chamber.

On Apr. 10, 1940, the Althing authorized the Government temporarily to exercise the sovereign powers vested in King Christian X and to assume full charge of Iceland's foreign affairs, previously conducted by Denmark under the Act of Union. The Althing on May 16, 1941, adopted various constitutional amendments with a view to establishing an independent republic upon expiration of the Act of Union in 1943. Sveinn Björnsson, former Icelandic Minister to Denmark, was elected Regent on June 17, 1941. After the proclamation of the republic on June 17, 1944, Björnsson became President. Chosen by the Althing for a one-year term, he was continued in office in 1945; see EVENTS below.

Events, 1945. In contrast with 1944, when Iceland achieved full national independence and elected its first President, the past year was uneventful for the little island republic.

Even in the final phase of the war Iceland suffered a shipping disaster: in mid-February, the S.S. Dettifoss, last passenger ship plying between Iceland and the United States, was torpedoed and sunk with the loss of 15 lives.

Considerable disappointment was felt in political circles at the Allies' failure to invite Iceland to the San Francisco Conference. Such an invitation would probably have been extended had Iceland declared war on Germany before March 1. But quite apart from the fact that Iceland in 1918 announced itself perennially neutral and embodied this declaration in its Constitution, the predominant feeling was that it would be ridiculous for a country without any armed forces whatsoever to declare war on anybody.

The first popular election for the presidency, scheduled for May, was called off when no opposition developed in the Althing against continuing the incumbent, Sveinn Björnsson, in office. On March 28, the assembly agreed by acclamation to reelect the first President, whose initial term was due to expire in June 1945, for the regular four-year period ending in 1949.

The question of American bases in Iceland continued to agitate public opinion throughout the year. On June 3, Brig. Gen. Martinus Stenseth, U.S. commander on the island, declared in Stockholm that after four or five months Iceland no longer would be needed as a military base. He forecast the withdrawal at that time of all American forces except for the staff of the principal airfield near Reykjavik, which is an intermediary landing place on the United States-Sweden air transport route.

In October, however, reports gained wide circulation that the United States was negotiating with the Reykjavik Government for a 99-year lease

of the military and naval bases established on the island. Apparently in connection with this development, Representative Bertrand W. Gearhart of California on Oct. 29 introduced a resolution in the House, in Washington, to invite Iceland into the United States as the 49th state. The suggestion was as coolly received in Iceland as in the U.S.

Production. Fishing is the chief industry; it supports nearly 30 per cent of the population directly and in 1942 it provided 96 percent of the value of all exports. About 36 per cent of the inhabitants live by agriculture, sheep raising, and dairy farming. Potatoes, turnips, and hay are the chief crops. There are very few trees and only low grade coal deposits, but extensive peat deposits are used for fuel and many buildings in Reykjavik are heated by water from hot springs.

Foreign Trade. Imports in 1944 averaged 20,610,000 crowns a month, while exports were valued at 21,190,000 crowns monthly. Great Britain and the U.S. were the chief trading countries during the war.

JOACHIM JOESTEN.

ILLUMINATION. In spite of wartime limitations, significant progress was made in illuminating engineering and allied activities. Many were military developments, some of which now may be talked about. In the more ordinary applications of light, never before have there been such high levels of illumination as during the war years. The practical value of high illumination levels in getting out the quantity and quality of war goods demanded of American industry was demonstrated beyond doubt. Outstanding contrast was the development of an understanding and technique of low-level illumination such as was required for blackout conditions.

The number of large lamps sold reached an annual total of 850 million units in 1944, or 180 percent of the 1938 total. Fluorescent lamp consumption progressively doubled itself during the war years, reaching a high of 35 million units in 1945. The total sales of all types of lighting equipment rose to a peak of more than \$250,000,000 in 1942, and electric power consumption for illumination rose above the level of 60 billion kw-hr annually during the war years, 200 percent of the 1938 level.

Military use of light and lighting equipment ranged from the 600-million candlepower searchlights to high-level fluorescent lighting in battleship control rooms, and down to the scarcely measurable light radiated by phosphorous tape and radioactivated fluorescent instrument dials and marker buttons used in combat under blackout conditions. Military construction projects were floodlighted by means of portable equipment. Temporary and emergency landing strips were floodlighted and outlined by air-borne lighting kits. An especially rugged "high-impact" filament lamp was designed for the Navy. This lamp has a special crystal structure in the tungsten wire to give it mechanical strength either hot or cold. The filament is coiled on a small mandrel with high pitch to resist distortion while burning; multiple supports for the filament were used with a 90 degree bend at each loop to prevent "interlock." A special cushioning base with either a copper-wire mesh or rubber sleeve provided strength sufficient to resist every shock except a direct hit.

Much of the superior marksmanship of aerial gunners was due to the optical gunsight. This utilized a special gunsight lamp about the size of a walnut which comprised a complete optical pro-

jector within a frosted and silvered bulb. Special forms of filament in this lamp were mounted accurately within the bulb to project uniform and intense light on the reticle of the gunsight, creating the sight range used for aiming. The sea-rescue lamp is similar in principle, and with no other optical accessories throws a beam visible at night for 60 nautical miles in clear weather. A lighting kit containing complete equipment for lighting an emergency airport, and readily portable by air, was developed in 1944. Little 10- and 25-watt 120-volt lamps were used for outline lighting in small prismatic hoods. The floodlight lamp is a special 1250-watt 120-volt biplane filament lamp suitable for use in a Fresnel lens optical system. The flashing beacon lamp is a 99-watt 110-volt lamp with special filament. Thousands of these kits were made and used, chiefly in the Pacific area. Tons of fluorescent and phosphorescent materials were used for aircraft and marine instrument dials, military maps, luminescent guide tape, signal flags, sea rescue kits, and many other uses. During the last days of the Belgian Bulge, 10,000 pounds of brilliant fluorescent identification panels were flown daily to Europe to be used by U.S. ground forces to identify themselves to friendly aircraft. This was necessary because so much American equipment had been captured by the Germans that Allied fliers could not tell friend from foe.

Photographic lighting and the use of light and ultraviolet radiation in photochemical reactions ranked high in military importance. It can be reported that on every front round-the-clock reconnaissance photographic runs were made by airmen, the night pictures being lighted from high-flying airplanes by new and enormously high-powered flash electric lamps. In photochemistry, some of the more important wartime products were created by the use of the catalytic action of light, chiefly the near-ultraviolet. An example is the gas hexachlorethane used for smoke screen. The gas was used in large quantities in Europe and was made entirely by photochemical processes employing mercury-vapor lamps.

Developments of commercial lighting included some new sources. "Slimline" fluorescent lights were created to provide longer thinner lamps for showcase lighting and other installations where space is limited or where long ribbons of light are desired. Development of a 32-watt 12-inch "circine" lamp was demonstrated in November, for use in portable fixtures or for decorative purposes. Miniature fluorescent lamps were developed for decorative purposes including Christmas-tree lighting. A 375-watt infrared lamp was developed for industrial heating service. A new color for fluorescent lamps, known as 4500-degree white, was announced for 40-watt and 100-watt sizes. This provides a color between the 3500-degree standard white and the 6500-degree, called daylight. Special fluorescent lamps were developed for direct-current service. A new 400-watt mercury vapor lamp was developed for street lighting service, and some experimental installations made. Experimental installations also were made of fluorescent lights for street lighting purposes. A new photo-flash bulb was developed for use with daylight color film, to provide better color balance and 40 percent more light output, as the result of the use of an improved blue dye in the lacquer coating of the lamp. A 1-watt fluorescent glow lamp was announced for night-light and safety-light service chiefly in the home. New fluorescent lamps with a new phosphor and special glass provide erythral

radiation for sun-lamp service; to be available in 20-watt and 40-watt sizes. Corresponding improvements were reported in accessories and related fixtures. Experiments are continuing in the use of ultraviolet radiation for the reduction of air-borne bacteria in stores, schoolrooms, homes, and other places where public health is affected.

G. ROSS HENNINGER.

IMMIGRATION, EMIGRATION, AND NATURALIZATION. The immigration and nationality laws are administered by the Immigration and Naturalization Service of the United States Department of Justice.

Immigration and Emigration. During the fiscal year which ended June 30, 1945, 38,119 immigrant aliens were admitted to the United States for permanent residence. This represents a 34 percent increase over the 28,551 immigrants admitted in the previous year, and is the largest number admitted in any year since the United States entered World War II. However, it is a marked decrease from the admissions of prewar years which aggregated 51,776 in 1941, 70,756 in 1940, and 82,998 in 1939. The permissible quota for the year was 153,879 but just 7.5 percent of the quota was filled by the 11,623 quota immigrants admitted. The quota of 105 persons of the Chinese race, authorized by the Act of December 17, 1943, was the only quota completely filled. However, a number of countries with small quotas, Greece, Portugal, and Spain, completed at least 85 percent of their quotas. Of the 26,496 non-quota immigrants 22,770 were natives of non-quota countries, chiefly Canada and Mexico. Other non-quota immigrants were 3,078 relatives of citizens, 230 ministers, professors, and their wives and children, and 360 in all other classes. The number of immigrant aliens admitted, showing the countries in which they last resided, and the number of resident aliens departing for future permanent residence abroad, are shown in the accompanying table.

Aliens admitted for temporary stay, and resident aliens returning from a brief sojourn abroad, totaled 164,247. This number comprised 18,054 government officials, their employees and families; 107,729 visitors for business or pleasure, 28,174 aliens in transit through the United States, 6,896 returning resident aliens, 2,866 students, and 528 in other classes. The relaxation of travel restrictions by the governments of Canada and the United States accounts in a large measure for the increase of 42 percent from the number of non-immigrants admitted last year.

Aliens seeking admission to the United States who do not meet the requirements for entry are excluded at the ports of entry. During the past year 2,341 aliens seeking admission for 30 days or longer and 1,901 aliens at the land borders who wished to come in for less than 30 days were excluded. Of those who sought admission to remain for more than 30 days, 70.4 percent were excluded at the Canadian border, 14.5 percent at the Mexican border, and the remainder at the seaports. The Act of September 27, 1944, amended Sec. 3 of the Act of February 5, 1917, so as to exclude "persons who have departed from the jurisdiction of the United States for the purpose of evading or avoiding training or service in the armed forces of the United States during time of war or during a period declared by the President to be a national emergency." Under this new provision, 6 persons were debarred from entering the United States who sought to enter for 30 days or more, and 9 were excluded who sought admission for less than 30 days.

IMMIGRANT ALIENS ADMITTED AND EMIGRANT ALIENS DEPARTED, FISCAL YEARS 1944 AND 1945, BY COUNTRIES OF LAST OR INTENDED FUTURE PERMANENT RESIDENCE

Countries	Immigrant		Emigrant

	42	987	15	341

The greatest volume of travel into and out of the United States from foreign territory occurs at the Canadian and Mexican borders where aliens and citizens frequently make daily or weekly crossings and re-crossings. During the fiscal year 1945 there were 55,801,140 such entries of which 27,395,495 were by aliens and 28,405,645 were by citizens.

Passengers arriving by air at land and seaports totalled 304,331, and continued an upward trend represented by an increase from 251,237 in 1944 and 162,019 in 1943. Immigrant Inspectors boarded 76,946 vessels and 44,389 planes, and in so doing examined 768,921 alien crewmen and 894,915 citizen crewmen. Alien crewmen who deserted numbered 5,577, including 1,519 British, 1,325 Chinese, and 911 Norwegian.

The continued manpower shortage led to the extension of regulations and agreements reached with nearby countries regarding the importation of alien laborers. Since 1942, when the first agreements were made, there have been 354,896 laborers admitted to the United States, chiefly from Mexico and the West Indies. Most of these persons have been repatriated. On June 30, 1945, there remained in the United States 99,434 agricultural laborers, 64,990 railroad track workers, and 17,833 aliens employed in industries and services essential

to the war effort. These are now in the process of being returned to their homelands.

Deportations and Voluntary Departures. Importation of large numbers of alien laborers from nearby countries, augmented by the alien seamen who deserted at United States ports, plus the backlog of warrants for deportation of persons destined to European countries which could not be executed during the war years, caused a greater number of deportations and voluntary departures of deportable aliens than during any previous year on record. In all, 11,270 aliens were deported and 69,490 aliens who had been adjudged deportable were allowed to depart at their own expense without warrants of deportation. Among them were more than 8,000 Mexican nationals deported and 50,900 who returned voluntarily across the Mexican border. With the end of the European phase of the war it was possible to begin the return of deportable aliens to Europe. The first group left on May 31, 1945, on board the S. S. Cripsholm. The group consisted of 671 deportees, of whom 523 were Italian, 147 Greek, and 1 Arabian. The principal causes for deportation of aliens under warrants were: (a) entry without a valid immigration visa, (b) remaining longer than authorized, (c) entry of persons who had been previously debarred and deported. Three other groups of aliens were deported to Europe in the ensuing six months.

Border Patrol. The average size of the force of Border Patrol officers and employees in all grades of duty during the fiscal year 1945 was 1,065. These officers patrolled 8,863,416 miles, examined 1,254,533 conveyances, and questioned 4,161,573 persons. They seized and delivered to other appropriate law-enforcement agencies 75 automobiles and trucks valued at \$39,664 and recovered 25 such vehicles valued at \$15,135, restoring these to the owners from whom they had been stolen. During the year Border Patrol officers apprehended 69,164 aliens. This represents an increase of 122 percent or 37,990 aliens over last year, and 3,737 aliens more than the combined totals of the 4 preceding years. This was due to the unprecedented influx of Mexican nationals into the Imperial Valley of California, the Yuma Valley of California and Arizona, and the lower Rio Grande Valley of Texas. Patrol officers also apprehended 136 alien smugglers, 20 more than in 1944, and 1,339 violators of other laws, a decrease of 44 percent over last year.

Aliens and Alien Registration. All aliens remaining in the United States for 29 days or longer are required to register under the provisions of the Alien Registration Act of 1940. During the fiscal year 1945 there were 153,015 registrations recorded. The initial registration for aliens began on August 27, 1940, and continued through December 26 of that year. During this period 4,889,770 aliens registered as residents of continental United States. Factors determining the alien population are net immigration, naturalization, and mortality. By using the true figures for immigration and naturalizations, and estimating the alien mortality for the period, it is possible to arrive at the approximate alien population. On such a basis it is estimated that there were approximately 3,050,000 resident aliens in continental United States on June 30, 1945. This estimate does not take into account those here temporarily; that is, non-immigrants, border crossers, and imported laborers.

Naturalization. Certificates of naturalization were issued in the United States and overseas to 231,402 persons during the fiscal year ended June 30, 1945. This is a marked decrease from the highest re-

corded figures of 441,979 certificates granted in the fiscal year 1944. Of the certificates issued in 1945, 208,707 were received by civilians. The nations to which new citizens formerly owed allegiance were: British Empire 36,798; Czechoslovakia 5,561; Germany 42,720; Greece 3,838; Hungary 6,075; Italy 39,654; Poland 20,003; USSR 11,714; Yugoslavia 3,614; all other countries 38,730. During the year 9,782 petitions for naturalization were denied; there were 7,297 denied in the fiscal year 1944.

The Second War Powers Act, approved March 27, 1942, made available an expeditious naturalization procedure to non-citizens serving in the armed forces of the United States. The statute provided a judicial naturalization process for those residing within the jurisdiction of a naturalization court, and an administrative naturalization process for those serving abroad. For the fiscal year 1945, 17,029 members of the military and naval forces residing in the United States, Alaska, Hawaii, Puerto Rico, and the Virgin Islands were admitted to citizenship on the basis of petitions filed with naturalization courts. Such persons formerly owed allegiance to the following countries: British Empire 4,914; China 367; Czechoslovakia 243; Germany 2,290; Greece 378; Hungary 204; Italy 1,562; Mexico 2,316; Poland 618; Switzerland 214; USSR 334; all other countries 3,589. In addition, a total of 5,666 persons serving abroad with the armed forces of the United States were admitted to citizenship by designated representatives of the Immigration and Naturalization Service under the administrative process. Naturalizations were granted in the following areas: England 997; France 1,208; Italy 727; other Europe 127; India 246; other Asia 115; Australia 444; New Guinea 1,411; other Pacific 239; all other countries 152. Among such petitioners naturalized were 1,899 subjects of the British Empire, 326 Germans, 427 Italians, 191 Poles, 116 Russians, 590 Filipinos, 1,121 Mexicans, and 92 Chinese.

There were 165 naturalization certificates judicially granted which were revoked during the year, a reduction of 73 as compared with the preceding fiscal year. In 122 cases the Foreign Service of the State Department initiated the action because naturalized citizens of this country became permanent residents of foreign countries within five years after naturalization. In the remaining 43 cases the Immigration and Naturalization Service initiated action because naturalization was fraudulently or illegally procured.

Nationality may be lost involuntarily through committing treason against the United States or attempting by force to overthrow, or bearing arms against, the United States, provided there is conviction by court martial or a court of competent jurisdiction; through deserting the military or naval service of the United States in time of war, provided there is conviction by a court martial and dismissal or dishonorable discharge as a result of such conviction. Nationality may also be lost by departing from or remaining outside the jurisdiction of the United States in time of war or national emergency for the purpose of evading or avoiding training and service in the armed forces of the United States. In addition to approximately 5,000 American-born Japanese, whose renunciation of citizenship was approved by the Attorney General, there were 1,936 persons who expatriated themselves in the past year; 1,896 of these took affirmative action in a foreign country which resulted in loss of citizenship.

Petitions for naturalization, exclusive of over-

seas petitions by members of the armed forces, were filed by 195,917 persons. Declarations of intention filed in the fiscal year 1945 dropped to 31,195, the lowest number recorded since 1907, which was the first year in which consolidated statistical records of naturalization were made. There were 42,368 declarations filed in 1944, 115,664 in 1943, and 221,796 in 1942.

Alien Enemies. Alien enemies include natives, citizens, denizens, and subjects of countries with which the United States has been at war (Japan, Germany, Italy, Hungary, Rumania, and Bulgaria). By authority of Presidential Proclamations of December 7 and 8, 1941, and January 14, 1942, a series of regulations was promulgated by the Department of Justice affecting the conduct of citizens and subjects of Japan, Germany, and Italy, 14 years and older. (On October 19, 1942, aliens of Italian nationality were excepted from the travel regulations prescribed for alien enemies by the Attorney General.) The President, by proclamation on December 12, 1945, revoked the regulations of December 7 and 8, 1941, relating to the possession of certain prohibited articles, and to travel within the boundaries of the United States.

During the fiscal year 1945 the population of alien enemy detention camps increased by 2,784, including 116 children born at the family internment camps. In the same period, 1,658 were released from the camps; 792 for repatriation, 627 on parole, 88 for internment at large, and 119 by discharge. In addition, 32 died, leaving 7,364 in custody at the close of the fiscal year. Of this number there were 2,107 Germans, 25 Italians, 5,211 Japanese, 7 Hungarians, 2 Rumanians, and 12 others. Of the total, 1,120 (197 Germans and 923 Japanese) were persons who applied for voluntary internment to join husbands or fathers in one of the family internment camps; 3,015 were persons apprehended in continental United States under Presidential warrants; 733 persons were brought to continental United States from Alaska and Hawaii, 1,952 from Central and South America; 532 were seamen who were members of crews of enemy merchant vessels taken into custody in ports of the United States. Seven detention centers were in operation at the close of the fiscal year, four having been closed.

New Legislation. The Act of December 19, 1944, eliminated in certain cases the liability of transportation companies to fines and penalties for bringing aliens to the United States without proper documents, and authorized the Attorney General, in his discretion, to mitigate penalties incurred for failure to detain and deport alien seamen.

The Act of December 22, 1944, eliminated the requirement of lawful admission in the cases of naturalization applicants who entered the United States prior to September 1, 1943, and who, during World War II, served honorably in the armed forces beyond the continental limits of the United States.

The Act of April 30, 1945, provided for the imposition of severe penalties for procuring or attempting to procure the escape of any prisoner of war or interned enemy alien held by the United States or any of its allies.

The Act of July 3, 1945, provided additional appropriation for the fiscal year ending June 30, 1946, on behalf of certain workers entering the United States temporarily to perform labor essential to the war effort.

The Act of October 29, 1945, amended the Immigration Act of May 26, 1924, so as to add to the classes excludable on the ground of ineligibility

to citizenship certain aliens of neutral countries who applied for relief from training and service in the armed forces of the United States.

The Act of October 11, 1945, amended the Nationality Act of 1940 by providing that nationality shall not be lost, under the provisions of Sections 404 or 407 of that Act, by certain citizens residing abroad until the expiration of six years following the date the said Nationality Act was approved.

The Act of Dec. 28, 1945, expedited the admission to the United States of alien spouses and alien minor children of citizen members of the armed forces, by exempting them from the documentary requirements and from exclusion on the ground of certain physical and mental defects.

UGO CARUSI.

INDIA. A peninsular sub-continent of Asia jutting into the Indian Ocean and separated from the rest of the continent by the Himalayas. The Indian Empire, a part of the British Commonwealth and Empire, consists of British India, or the territories subject to British law, and the Indian States, ruled by native princes but under the indirect control of the British Parliament. The total area is 1,576,000 square miles. Capital, New Delhi. Summer seat of government (April to November), Simla.

Government. The King of Great Britain and Northern Ireland also bears the title of Emperor of India. The Constitution, known as the Government of India Act, 1935, provided for an Indian federation and provincial autonomy. Provincial autonomy went into effect Apr. 1, 1937, when elective legislative assemblies with responsible ministries were established in the 11 Governors' Provinces under direct British rule. In Oct.-Nov., 1939, the All-India Congress ministries in 7 of the 11 provinces resigned and on Nov. 5, 1939, the Governor General utilized his emergency powers to restore all governing powers in these provinces to the appointive British governors. Parliamentary government was retained in the other four provinces and on Nov. 24, 1941, was restored in one additional province.

The federation scheme provided for the union under a central government of the 11 Governors' Provinces and the 562 Native States ruled by Princes owing suzerainty to the British Crown. For different and often contradictory reasons federation was opposed by most of the politically vocal elements in India. Following the outbreak of World War II, the Governor General announced, on Sept. 11, 1939, that no further steps toward federation would be taken until peace was concluded.

In the meantime executive powers were concentrated in the hands of the Governor General, or Viceroy, who is appointed by the Crown, usually for five years, and assisted by an appointive Executive Council, composed of 15 high officials (11 Indian and 4 British) responsible for the various administrative departments. The Governor General also holds the separate office of Crown Representative (established Apr. 1, 1937) through which he performs the functions of the Crown in relation to the Native States. Pending the federation of the Governors' Provinces and Native States, the Governor General remains under the direction of the Secretary of State for India in the British Cabinet, and the Central Legislature of British India, established in 1921, continues in existence. The Legislature consists of a Council of State of 32 elected and 26 nominated members (serving five years) and a Legislative Assembly of 102

elected and 39 nominated members (serving three years). The Central Legislature's actions are not binding on the Governor General and his Cabinet.

Governor General and Crown Representative, Field Marshal Viscount Archibald P. Wavell, who was appointed June 18, 1943. For political and other developments during 1945, see below.

Events, 1945. The political deadlock with respect to constitutional reform in India which existed since the failure of the Cripps mission in 1942 (see YEAR BOOK for 1942, pp. 320-321) persisted with little change of emphasis through the first five months of 1945. The Conciliation Committee of the Non-Party Leaders' Conference formed by the liberal leader Sir Tej Bahadur Sapru in December, 1944, continued its work without participation by the President of the Moslem League, Mohamed Ali Jinnah. The announced purpose of the committee was to ascertain exactly what the various Indian communities wanted and assess the measure of agreement among them, and then to recommend on its own responsibility, regardless of party or communal considerations, a just and practicable solution of the existing deadlock. Mohandas K. Gandhi, speaking for the large Hindu majority, gave his approval, but that of the Moslems was officially withheld.

New Proposals. In March a proposal for ending the deadlock was made by Sir Zafrulla Khan, chairman of the Indian delegation to the Commonwealth Relations conference just concluded in London. The recommendation was that the British Government should at once announce its readiness to accept any settlement upon which the Indians might agree within one year after the cessation of hostilities with Japan. Failing such a settlement within the given period, Britain should herself frame a provisional constitution for India by which India would secure dominion status. This would remain in force as long as Indians themselves were not agreed upon an alternative. This proposal was received with considerable interest in Britain but in India it failed to stir the opposing forces from their entrenched positions.

At the end of March Field Marshal Viscount Wavell, the Viceroy, left India for London to discuss India's role in the Far Eastern war and to review the political situation. Shortly after the Viceroy's departure Sir Tej Bahadur Sapru sent him a telegram containing a new plan for India worked out by the Conciliation Committee. Under this plan India should at once be declared an independent state and treated as a dominion, even though, pending the coming into force of a new constitution, the Government of India might have to be conducted in conformity with the provisions of the Act of 1935. A National Government should be substituted for the existing Executive Council, by either of two methods outlined in the telegram.

Jinnah, commenting on the proposals, said that if they were accepted, Moslem aspirations and their national demand for the Moslem state of Pakistan "would be torpedoed by this subtle outflanking movement." Moslem India, he said, would not accept any attempt to change the existing constitution in any way which would mean a united India. If the British Government were stampeded into it, he added, the British Government alone would be responsible for the disastrous consequences to which it might lead.

Other proposals appeared at the end of May in a pamphlet published by C. R. Rajagopalachari, former Congress Premier of Madras, a moderate who resigned from the Congress Party in 1942 when the Cripps offer was refused. In the pam-

phlet, which was entitled "Reconciliation: Why and How," Rajagopalachari urged action by the British at once in restoring responsible government to the provinces and offered several schemes by which the details might be worked out.

In the meantime Lord Wavell's unexpectedly long absence in England, the end of the war in Europe and the imminence of a general election in Britain gave rise to rumors and speculations in India. On April 17 Gandhi disowned the Indian delegation to the conference at San Francisco as "camouflage" and "worse than no representation" because India should have elected representatives or none at all. After an extended criticism of the domination of one nation over another he refused to say more because he was observing a period of silence.

Bhulabai Desai, leader of the Congress Party in the Central Assembly, let it be known that he too had submitted proposals to the Viceroy, looking towards the Indianization of the Executive Council. The Congress press took the line that there must be a national government responsible to the central legislature, a proposal which would give the approximately 250,000,000 Hindus domination over the approximately 90,000,000 Moslems. Indian industrial leaders, including active supporters of Gandhi, who were interested in the scheme for planned development which had been announced in 1944 (see YEAR BOOK for 1944, p. 292), argued that India's urgent needs could not be met until the energies of Indian leaders were enlisted for creative work in the economic as well as in the political sphere.

New British Offer. In the first days of June the tension increased. Lord Wavell reached Karachi on June 4 on his way back from London. Two secret meetings of the Executive Council were held on June 5th. Leopold S. Amery, Secretary of State for India, said in London on June 6 that British and Indians alike wanted the deadlock ended. Finally, on June 14, a White Paper issued in London proposed the reconstitution of the Viceroy's Executive Committee as an all-Indian body except for the Viceroy and a commander-in-chief. The new Executive Council would be appointed by the Viceroy from among Indian leaders selected by a conference of recognized party leaders, including Gandhi and Jinnah, and acceptance of the offer would be without prejudice to the future permanent form of Indian government or the Cripps offer of Indian home rule, which was renewed. The proposals of the White Paper, as presented by Amery in the House of Commons, were commended by Labor Deputy Prime Minister Attlee and by Sir Stafford Cripps.

The proposal was at first received calmly in India. The Viceroy called a meeting of leaders of 21 political factions at Simla on June 25. Gandhi, who maintained amiable relations with the Viceroy in the interval, refused to attend and Moslems charged that he had torpedoed the conference. On the third day of the conference the inevitable conflict between Hindus and Moslems came to a head and on June 29 negotiations between the Congress Party and the Moslem League broke down. The Moslem League wished to name all the Moslems nominated for the Council, but the Congress Party, which claims Moslem membership, demanded the right to make at least one Moslem nomination. The Viceroy issued a statement on July 14, when the conference ended, commenting on the failure of conversations after the adjournment of June 29, asking the members to refrain from recriminations.

India and Whitehall. When the Labor Government came into power in Britain Indian opinion showed some disappointment that an end was not put to the India Office, but on the whole it indicated some satisfaction with Lord Pethick-Lawrence, newly appointed peer and new Secretary of State for India. In his maiden speech in the House of Lords the new appointee made a good impression in his comments on the Indian situation and with his announcement that Lord Wavell would soon return to London for consultation.

In the meantime Lord Wavell held a conference with the Indian provincial governors—the third since he became Viceroy—and obviously made plans for whatever changes might follow the elections for the Central Assembly in the winter and the provincial elections in the spring of 1946.

Labor Government Plan. Official statements by Lord Wavell and Prime Minister Attlee on Sept. 19 outlined revised plans for the early realization of full self-government in India. The starting point was given as the general election, after which the Viceroy would discuss with representatives of the provincial legislative assemblies, the Cripps proposals ("1942 Declaration") for convening the constitution-making body which it was the Government's announced intention to set up. Discussions with representatives of the Indian States were also planned. Although the Cripps proposals remained the basis for discussion, they lost their former rigidity and any alternatives or modifications which might prove preferable were now open to adoption. The Cripps proposal was that a new Indian union be established, constituting a dominion equal in every respect to other British dominions, and that steps be taken after the war to set up an elective body charged with framing a constitution.

Reception of the plan in India conformed to pattern. The Working Committee of the Congress Party called the program "vague, inadequate, and unsatisfactory, and in its three-day meeting ending Sept. 23 the All-India Congress Committee supported the Working Committee. Prolonged cheering greeted the declaration by Pandit Jawaharlal Nehru, Congress Party leader recently released from custody, that Congress would not again attempt negotiation with the Moslem League, which had, he said, tried to humiliate Congress every time they made an approach. Lord Pethick-Lawrence said in comment that he was neither disturbed nor disheartened.

Internal Friction. After the Labor Government's proposals were made the situation in India rapidly deteriorated. Hindu-Moslem riots in Bombay on Sept. 26 resulted in death to 17 persons and injuries to 75. Rioting occurred in Calcutta in mid-November, with attendant casualties (including 4 Americans dead and 30 injured) over opposition to trials of former Indian officers of the so-called "Indian National Army" who went over to the Japanese. Pandit Jawaharlal Nehru, who became increasingly active, said in an election speech at Lahore on Nov. 20 that India would wait for no more declarations or promises from New Delhi and London, but would solve the issue of freedom itself.

Moslem interest in the Palestine issue was very marked at this time. Jinnah said on Oct. 3 that "President Truman's reported Palestine immigration proposal is an unwarranted encroachment on another country, monstrous and unjust." At a public meeting in Bombay on Nov. 8 he said that Moslems would not remain mere spectators of the Arab struggle against British imperialism and against the illegal immigration of Jews into Pales-

tine and criticised "President Truman's effrontery" in putting pressure upon the British Government to allow 100,000 Jews into Palestine when he himself would permit only a few Indians to enter the United States.

New British Statements. On Dec. 4, Lord Pethick-Lawrence in the House of Lords and Herbert Morrison in the House of Commons made identical statements on India which emphasized that the setting up of a constitution-making body in India was a matter of the greatest urgency. The statements contained a warning against attempts to solve the constitutional issue by force and announced that a Parliamentary delegation would soon visit India with a view to removing misunderstandings. The *Hindustan Times* in its next issue headed its comment "A Purposeless Statement."

The Viceroy, speaking on Dec. 10 at the annual meeting of the Chambers of Commerce, made an earnest appeal to Indian leaders to exercise moderation and to avert the civil violence and strife which threatened the country. Lord Wavell said that India stood "at the golden gate of political and economic opportunity" and yet "at the edge of tragedy."

Industrial Planning. The authors of the Bombay Plan issued a second part of their scheme in the middle of January. The Bombay Plan of National Development, first issued early in 1944, was the work of 8 leading industrialists who were either supporters of the Congress Party or were strongly nationalist in their political outlook. Its proposals included the investment of 10,000 crores of rupees in industrial development and the doubling of the per capita national income within 15 years.

In the second part of the report the authors expressed their belief in individual initiative and enterprise, but added that the interests of the community should be safeguarded against the abuse of individual freedom. The State, therefore, should play a positive rôle in the direction of economic policy, according to the report.

A statement on industrial policy issued by the Government of India, on April 23, indicated decisions reached on the policy of industrializing India rapidly after the war. The development, in cooperation with industry, was to be planned so as to maintain a balance between basic and consumption goods and to give India the benefit of a widely spread industrial structure and its integration with agriculture. In order to make their coordinated development possible, 20 important industries were to be taken out of the charge of the provincial governments and made central government subjects. This report followed the lines previously suggested by the Reconstruction Committee of the Viceroy's Council, formed in 1943. The head of the committee since August, 1944, has been Sir Ardeshir Dalal, one of the eight original proponents of the "Bombay Plan" and an executive of Tata Iron and Steel Co., Ltd.

The statement was almost immediately attacked—first on political grounds and then on its failure to promise unlimited tariff protection to all industries, its qualifications with respect to quality and price in the purchase of domestic manufactures, and its control over concentration of assets according to communities. Hindu and Parsi business interests were quick to call the plan "simple bureaucracy," vague and blurred, and a dangerous concentration of power in the Government.

Report on Bengal. The Bengal famine of 1943 (see YEAR BOOK for 1943, p. 281) revealed such deep-rooted local maladministration that efforts were still being made to get at the roots of the

situation. The Bengal Administration Inquiry Committee, 1944-1945 (the Rowlands Committee) published its report in Britain in October, 1945. The accounts of corruption in the administration were not unexpected, but the committee also criticized the land-holding system and advocated the setting up of a separate Ministry of Land Reform.

Richard Gardiner Case, former Australian Ambassador to Washington, who undertook the Governorship of Bengal when a more vigorous administration was demanded in December, 1943, resigned in 1945, and Frederick Burrows, a British railway trade union leader, was appointed to succeed him after Casey's retirement in February, 1946. Rice prospects at the end of the year were not good and imports from Burma and Siam in 1946 were allotted by the Combined Foods Boards in November, 1945.

Other Events. It was reported from Tokyo on August 23 that Subhas Chandra Bose, Indian political leader who headed the puppet government which the Japanese planned for India, died in an airplane crash in Formosa on Aug. 19. The report, if true, meant that the British authorities would be relieved of a difficult problem, for Bose had a considerable Indian following. India adhered to the Bretton Woods agreement at the end of December. Indian journals almost without exception gave notice, however, that India would not consent to the scaling down of the British debt to India—the largest of the debts involved in the American requirement that Britain should scale down sterling debts.

Population. According to the census of 1941 the population of the country was 388,997,955, most of whom (87 per cent) live in villages. The small percentage of city dwellers live in such key cities as Calcutta, Bombay, Madras and Hyderabad. The density of the population (about 245 per square mile) is one-third of that of England and Wales (724) or Belgium (723) and less than that of Switzerland (265 per square mile).

The birth rate rose from 31.3 per thousand in 1931 to 34.1 in 1938. The death rate decreased from 24.9 in 1931 to 22.0 in 1941. The infant mortality rate is 162 per thousand.

Although the Indian population includes more than 45 groups speaking nearly 200 different languages, classification is commonly made according to the following religious communities: 66 per cent Hindus, 24 per cent Moslems, and the remaining 10 per cent of a wide variety of racial groups and creeds.

Education. Substantial increases in the enrollment of students in schools and colleges have caused an increase in literacy from 6.9 per cent in 1931 to 12.2 per cent in 1941. The level of literacy is considerably higher in the native states, with Travancore's 47.7 per cent, Cochin's 35.4 and Baroda's 23.0.

A solution to the problem of illiteracy was sought in a plan devised by the Educational Adviser to the Government of India in 1944 (the "Sargent Plan"). The plan contemplates a 40-year program of educational expansion, with free compulsory schooling for all children from 6 to 14. There would be an expansion of all of the existing recognized institutions: elementary, secondary (academic and technical), university, specialized, and adult.

Production. India is the world's largest producer of sugar cane, mica, jute, and lac, and ranks second in cotton, tea, and manganese. It has the largest reserves of high-grade iron ore in the world and the largest single iron and steel plant in the British

Commonwealth. The other chief industries are textiles, sugar refining, cement, soap, shoes, and chemicals. Many new industries were started after World War II began. Although India is primarily an agricultural country she is ranked among the 8 leading industrial nations.

Trade and Finance. Foreign trade has increased during the war and an export balance has been maintained. Exports rose from 93.43 crores of rupees in 1944 to 109.23 in 1945, while imports rose from 52.22 to 93.90 in the same period. United States trade with India showed a marked increase during the war years. Total U.S. exports increased from an annual average of \$35,000,000 in the years 1936-1939 to \$777,000,000 in 1944, while United States imports from India rose from \$75,000,000 to \$145,000,000 for the same dates.

India emerged from the war a creditor nation. She reduced her prewar sterling debt of 4,000,000,000 rupees to a negligible sum and accumulated sterling credits amounting to more than \$4,000,000,000 on Mar. 31, 1945. This creditor position was due largely to purchases by the United Kingdom and military and other expenditures made on behalf of the United Kingdom. India has also purchased its company-managed railways and discharged a number of domestic and foreign obligations not covered in the above transactions.

—ALZADA COMSTOCK.

INDIAN AFFAIRS, Office of. A branch of the U.S. Department of the Interior which has the management of all Indian affairs and of all matters arising out of Indian relations. It is responsible for upkeep on about 200 Indian reservations and supervises the education of 36,000 Indian children. Commissioner of Indian Affairs in 1945: William A. Brophy. For Indians, see also ALASKA.

INDOCHINA. The southeastern peninsula of Asia, consisting of Burma, Federated Malay States, French Indochina, Siam, Straits Settlements, and the Unfederated Malay States.

INLAND WATERWAYS CORPORATION. A Division of the U.S. Department of Commerce (formerly of the War Department) incorporated to carry out sections of the Transportation Act of 1920, to make possible the coordination of rail and water transportation in the United States. It is organized along the lines of a trunk-line railroad and functions entirely on funds derived from operations. It operates barge lines on several important water routes. Chairman of the Board and President: John S. Powell, Acting.

INSECT PESTS AND PLANT QUARANTINES. Research conducted cooperatively by the Bureau of Entomology and Plant Quarantine with Federal, State, and other agencies, has developed new insecticidal materials and applications which promise far-reaching effects upon the future control of insect pests. With the ending of the war, requirements by the armed forces have decreased appreciably, making available for agricultural and civilian use such new developments as DDT (dichlorodiphenyl-trichloroethane) and the so-called aerosol "bombs." The more promising recent methods and materials are being adapted to the control of pests of major importance, and to maintain the production of food, lumber and fiber, and information on these new methods is being made available to farmers, householders, and the industries concerned. Intensive study is being made of the possible limitations or hazards involved, and of pos-

sible more suitable weapons in this constant battle against injurious insects.

Plant Quarantines. Developments in the war situation have strongly affected plant-quarantine enforcement at maritime ports. Ship arrivals, during the fiscal year ended June 30, 1945, increased 30 per cent over those of 1944 to a total of 35,555. The Army program for returning troops from foreign areas by airplane accelerated the rapid growth of air-borne commerce. During the fiscal year 1945, 45,728 airplanes were inspected at 42 ports of entry, an increase of 112 percent over the previous year. It was necessary to provide plant-quarantine protection at 5 ports formerly without this service, and inspection has now been inaugurated in Alaska. Nearly 65,000 freight cars were inspected upon crossing the Mexican border, and more than 9,000 were fumigated as a condition of entry; these figures represent a decrease in this activity over the previous year, due to a reduction in traffic and the employment of procedures for waiving fumigation when it can be done without additional risk of pest entry. In addition, 5,390 Pullman and passenger coaches and about 4,800,000 other vehicles and over 930,000 pieces of baggage were inspected, upon arrival from Mexico, in cooperation with U. S. Customs. The use of tight railway refrigerator cars for the bulk fumigation of plant material with methyl bromide was authorized during the year.

Insect Identification. Over 59,000 insect specimens were identified during the fiscal year 1945, as a basis for the institution of proper control or quarantine action, or in connection with experimental work. In addition, approximately 6,000 samples of insects and mites involved in human-health problems were identified for the Army, Navy, and Public Health Service. Direct assistance or instruction in insect identification and classification was given many officers of these branches of the service.

New Insecticides and Methods of Application. Solutions, emulsions, powders, and aerosols containing DDT were formulated and tested, and specifications worked out for commercial grades of DDT and certain DDT preparations. Methods and formulations for its use have been used effectively by the armed forces. Preliminary recommendations have been made for the use of such insecticides against some insects, especially household pests such as mosquitoes, flies, bedbugs, and cockroaches. Extensive experimentation has shown formulations containing this important new material to hold much promise against a number of insects injurious to agriculture. Although not effective against all, it will be useful against many injurious to livestock and crops. Certain of its limitations still remain to be worked out before DDT can be recommended for use against some pests.

A new insecticidal material, the active principle of which is the gamma isomer of benzene hexachloride, was tested and found to be more toxic than DDT to some insects and less toxic to others.

Of special interest is the extension of the usefulness of the aerosol method of dispersing insecticides, both the liquefied-gas aerosol and those in the form of smokes. Varied types of distributors, whereby a concentrated spray, broken into very fine droplets, can be effectively applied from the air, have enlisted airplanes to apply sprays. On certain types of foliage good coverage over an area as large as an acre can be obtained with as little as one gallon of concentrated spray. This opens up new possibilities for the application of

liquid insecticides from the air. Similar improvements have been made in equipment for ground work. Further tests were made in the adaptation of heat-generated, or "smoke," aerosols. Tests of the latest models of power-blowers, for dispersing insecticides in finely atomized form, proved that the mist blower is especially well adapted to treat shade and roadside trees, and much less spray material is used by this method.

Insect Repellents. Two important developments were the repellents dimethyl phthalate, which can be applied to the outer garments to give protection against chiggers and to some extent against ticks; and benzyl benzoate for impregnation of clothing to furnish protection against mites which transmit scrub typhus in the Pacific area. It was found that a combination of dimethyl phthalate, Indalone, and 2-ethylhexanediol was an effective repellent of malaria mosquitoes in the United States—more generally so against mosquitoes and biting flies than any of these compounds alone.

Mosquitoes. The research with DDT has shown it to be outstanding in its toxicity to mosquitoes. Properly applied as a residual spray to the walls of dwellings or barns, it remains effective for several weeks or months, killing mosquitoes and flies that come in contact with treated surfaces. It has also residual value in controlling malaria mosquitoes. Mosquito-control workers have for the first time a material that can be applied from various kinds of aircraft to destroy at one operation larvae in the water and adult mosquitoes on the wing. Liquid larvicides were found more effective in the destruction of larvae than were dusts.

Screwworms. In southern Texas and southern Florida, where the screwworm passes the winter, the infestation in the early spring of 1945 was the heaviest for several years. Favorable weather stimulated breeding and the northward migration was rapid. The stage was set for a serious outbreak; however, hot, dry weather early in the summer checked the spread, and a general use of smear 62 held the insect to moderate abundance. Two new smears that contain chlorophenoxathin were developed for the treatment of screwworm-infested animals. The new smears showed a distinct advantage over those containing diphenylamine in that they did not become hard and crusty on the wound after the benzene had evaporated.

Stablefly (dog fly). In tests for the control of the stablefly (dog fly), in marine grass deposits along the coast of western Florida, it was found that 0.5 per cent of DDT in bay-water emulsion applied at the rate of about 2 gallons per 100 square feet of grass surface gave effective control of the emerging flies.

Codling Moth. In contrast to the extreme severity of the infestation in 1944, the codling moth was considerably less abundant and more readily controlled in 1945 in the Middle West and East. In the Northwest, the insect was a little less abundant than usual. In tests conducted in 1945, DDT continued to maintain its superiority over standard materials in control of this moth in New York, West Virginia, Indiana, and Washington. From $\frac{1}{2}$ to 1 pound of powdered technical DDT alone per 100 gallons of spray, or 4 to 8 ounces of DDT in combination with half-strength lead arsenate, cryolite, nicotine bentonite, or xanthone, were equal or superior to either material at usual full strength alone, or with oil. The use of DDT continued to stimulate the abundance of orchard mites, although the rainy season east of the Rockies prevented the mite population in many orchards from reaching extremely high levels.

Oriental Fruit Moth. The new method of producing the important oriental fruit moth parasite, *Macrocentrus ancylicorvus* Roh., from the potato tuber worm was further developed for use under eastern conditions. The Oriental Fruit Moth Survey was continued during the summer of 1945 in the States of Colorado, Idaho, Montana, Oregon, Utah, and Washington, as a result of which this moth was found for the first time in the States of Oregon and Washington. Additional infestations were found in Colorado, Idaho, and Utah.

California Red Scale. In small-plot fumigation tests at Whittier, Calif., against this insect on citrus, kills were obtained under plastic-treated gastight tents with one-third to two-thirds the amount of hydrocyanic acid gas that was required to effect approximately the same kills under canvas tents. Somewhat better kills of the insect were obtained when the hydrocyanic acid was introduced with a blower applicator than with the vaporizer now in common use.

Japanese Beetle. In much of the old infested territory the beetles were less abundant in 1945 than usual. The cloudy, wet weather which prevailed over much of the infested territory hindered activity by the beetle. Experimentally, one to three applications of DDT (micronized with an equal quantity of pyrophyllite and with glue as a wetting agent) at the rate of 1 pound to 100 gallons of spray gave almost complete control of the adult beetle on peach, early apple, grape, blueberry, and a miscellaneous group of ornamental and shade trees and shrubs. In soil tests a dosage of 25 pounds of DDT per acre proved more effective against third-instar larvae than 1,000 pounds of lead arsenate and to be as effective after 75 weeks in the soil as when first applied. A large-scale field experiment to determine the possibility of controlling this insect with DDT was undertaken at an established, isolated infestation at Blowing Rock, N.C. Results of the milky-disease distribution program for control of the larvae continue to be favorable. Revised Japanese beetle quarantine regulations were issued.

European Corn Borer. Infestation in 1945 was generally somewhat higher in the Corn Belt than in 1944, while in the Eastern States the population was about the same in both years. Heavy infestations in sweet corn and in potatoes were reported from a few isolated places.

Imported parasites that have become well established in the eastern states were collected and released in the more heavily infested sections of the Corn Belt in cooperation with interested states.

Preliminary tests of insecticide applications of DDT and ground stems of *Ryania spectiosa* were quite promising against this insect.

Grasshoppers. Adult and egg surveys in the fall of 1944 indicated that the grasshopper infestation in 1945 would be of approximately the same extent and intensity as that in 1944. Cool, wet weather, which prevailed over much of the infested area throughout the spring months of 1945, greatly reduced grasshopper hatching and development and delayed control operations.

Chinch Bugs. Although surveys in the fall of 1944 revealed large numbers in hibernation, the serious damage in prospect for 1945 was largely prevented by continuous cool, wet weather during the spring and early summer. Tests showed dust mixtures of DDT to be very effective as barriers, but for application directly on the bugs infesting sweet corn, popcorn, and oats, good control required heavy dosages.

Stored-Grain Insects. Tests in a commercial flour

mill showed that fumigation of machinery units every 3 weeks held the insect infestation at a sufficiently low level to insure the production of insect-free flour. Carbon tetrachloride and various mixtures of carbon tetrachloride with ethylene dibromide or trichloroethylene gave promising results as grain fumigants. Wrappings coated or impregnated with DDT, acrylamide, or a trichlorobutyramide were highly effective in preventing insect entrances into packages of cereals in experimental studies. Sprays containing 5 percent or less of DDT dissolved in refined deodorized kerosene or in water suspension or emulsion have been recommended for treating walls and woodwork of warehouses, flour mills, and empty grain bins. Weevils and other insect pests of stored grain and cereal products are killed as they contact the DDT residues while crawling on or burrowing into the treated walls or woodwork. Because of the poison hazard, care must be taken to avoid contamination of grains and food products with the spray.

Vetch Bruchid. Practical controls of this weevil in Oregon was secured, using a single application of 25 pounds of a dust containing 3 per cent DDT applied at the time of appearance of first pods.

White-Fringed Beetle. Important developments in equipment for insect control and extensive use of new insecticides and new formulas for others, particularly concentrated sprays, have greatly reduced costs and have permitted wider and more complete coverages. One important new infestation was found during 1945 in southern Alabama, and minor extensions of the infested areas in Florida and Mississippi. In North Carolina a few small infestations were found in seven counties not previously known to be infested.

Vegetable Insects. Special emergency surveys of insects that attack vegetables and their control requirements have been continued, in cooperation with State workers, industry, and other agencies. DDT in dust and spray forms and as an aerosol has proved to be very toxic to a number of common insect pests affecting vegetables; however, it has shown low toxicity against some important vegetable insects, notably the Mexican bean beetle, the tobacco hornworm, the turnip aphid, and a few others. The tolerance of vegetable plants to this insecticide has been high. Dust mixtures containing 1 or 2.5 per cent of DDT were superior to all other insecticides tested during the spring of 1945 to protect cabbage in South Carolina from caterpillar damage. If current research reveals that the use of DDT on cabbage does not incur a harmful residue hazard, or result in plant injury under the widely divergent conditions where cabbage is grown, it appears that this will prove to be a very effective remedy for cabbage caterpillars. Until more definite knowledge on the residue situation is obtained, its use on cabbage and related crops will be subject to the same limitations as that of arsenic and fluorine compounds. Large-scale tests in commercial sugar beet fields demonstrated that one application, by airplane or with conventional ground equipment, of a dust containing 5 per cent of DDT at the rate of 30 to 40 pounds per acre has exerted a control of *Lygus* plant bugs surpassing that of two applications of the pyrethrum-sulfur or sulfur-dust mixture. Studies indicated that the use of DDT did not affect adversely the yield of sugar beet seed or its viability. Early in 1945 the DDT aerosol with methyl chloride as the propellant agent was used on large field plots of peas for pea aphid control, and encouraging results were

obtained. In the greenhouse DDT in aerosol form was found to be very effective against several species of insects affecting vegetables grown under glass. Under greenhouse conditions the aerosols were applied with special dispensers. Tests and observations on the effect of applications of insecticides by airplane, in cooperation with other agencies, have shown that rotenone dust applied to beans by airplane in North Carolina was not so effective against the Mexican bean beetle as when applied by ground machine. In Washington, cryolite dust applied with ground equipment to potato fields gave better results against potato flea beetles than when applied by airplane. In Washington and Oregon good results were obtained from aerial applications of dust mixtures containing DDT or rotenone for control of the pea weevil and the pea aphid. In these tests the airplanes worked as well as ground equipment under comparable conditions when the same insecticide was used. Satisfactory results were recorded with airplanes to apply DDT dusts for control of *Lygus* plant bugs and the beet leafhopper on sugar beets grown for seed in Arizona. Hornworms and flea beetles on tobacco were controlled successfully in North Carolina by airplane applications of cryolite dust mixtures. The results obtained thus far indicate that the use of aircraft for applying insecticides to some vegetable and tobacco crops has a promising future.

Sweet Potato Weevil. Extensive expansion of production and distribution of sweet potatoes during the past several years, and the resultant increase in production and distribution of sweet potato seed stock, has greatly increased the hazard of dissemination of the sweet potato weevil, as evidenced by recent findings of this weevil in a number of new locations outside the previously known infested areas.

Cotton Insects. In each of the eleven states where the boll weevil is a serious pest it caused more damage in 1945 than during 1944. Late plantings, followed by a rainy season over most of the Cotton Belt, were favorable for weevil development and the shortage of labor for applying calcium arsenate helped to increase losses. In experiments against cotton pests it has been found that DDT is not as effective against the boll weevil or the cotton leafworm as calcium arsenate, and causes an increase of the cotton aphid and the common red spider. It has proved useful for bollworm, cotton flea hopper, and several other mirids, stinkbugs, onion thrips, tobacco thrips, and beet armyworm. In laboratory tests 2.5- and 5-per cent DDT dusts caused low mortality of the boll weevil, but 10-per cent dust approached calcium arsenate in effectiveness. In field plots several applications of 5-per cent DDT dust failed to control the boll weevils; 2.5 per cent added to calcium arsenate did not increase the mortality or the yield of cotton as much as did the calcium arsenate treatment. Preliminary experiments late in the season of 1944 and further tests in 1945 indicated that DDT was the most promising material that had been used against the pink bollworm. Dust applications of approximately 15 pounds per acre of DDT in pyrophyllite, beginning when the cotton bolls were large enough for the pink bollworm to infest them, and repeated at 5-day intervals, caused from 53 to 94 per cent reduction in larval populations in the 1944 tests. The gamma isomer of benzene hexachloride seems to have considerable promise for use against the boll weevil, the cotton aphid, and other sucking insects.

Forest Insects. In investigations of forest insects,

the spruce budworm was found in June, 1945, to be generally distributed throughout the Adirondack area in New York and the spruce-fir area in Vermont. Most of the infestation, by previous standards, was light, but defoliation was noticeable in a few places. The outbreak of the Engelmann spruce beetle in Colorado continued unabated, killing over 1 billion board feet of Engelmann spruce in 1944, and bringing the total loss of timber to approximately 2 billion board feet during the past 3 years. Extensive surveys showed the infestation to be increasing in area and severity. The discovery that this beetle hibernates beneath the bark at the base of the trees during the second winter, a habit unknown among closely related beetles, has an important bearing on control methods. In 1945 the program of experiments in the control of forest insects (such as gypsy moth, spruce budworm, pine tip moth, pine spittle bug, hemlock looper) with concentrated DDT sprays distributed from an airplane, has been greatly expanded and improved spray formulas have been tested. Considerable progress in improving and simplifying distributing apparatus has been made through cooperation with the Bureau of Plant Industry, Soils, and Agricultural Engineering of the U.S. Department of Agriculture. Special emphasis has been given to airplane applications of DDT in Quebec, Ontario, New York, and Colorado to determine whether the spruce budworm can be economically controlled by this method. Preliminary results are very encouraging.

DDT has also been found to be very effective against the group of elm insects suspected of transmitting the elm virus disease organism. Because general use over large forested areas cannot be recommended until the possible detrimental effects to beneficial insects, fish, and wildlife have been determined, large wooded areas were treated in 1945 for a study of this problem. Results are not yet available. Tests with various types of airplanes have demonstrated that the helicopter may help in treating woodland areas too large for economical treatment by ground equipment and too small for economical fixed-wing plane applications.

Gypsy Moth. In connection with control activities against the gypsy moth, emphasis was placed on use of the sex attractant to trap male moths and on manual types of surveys to delimit the area of infestation and locate all severe infestations. Control measures included cooperation in extensive experiments with DDT in several of the areas most heavily infested, particularly in Pennsylvania and in the New York-New England section. In tests during 1945 the insect was controlled with $\frac{1}{4}$ pound of DDT in one gallon of solvent per acre. This season's work has demonstrated conclusively that DDT is the most effective and economical insecticide discovered for the control of the gypsy moth, and its distribution by aircraft and improved spray equipment offers for the first time a practical means for controlling woodland infestations of this insect.

Bee Culture. Further evidence of the value of feeding a pollen-soybean flour supplement in winter to honeybees has been obtained. This resulted in better colony development early in the spring than did the generally accepted method of heavily packing colonies for winter without supplemental pollen feeding. In limited tests, bees fed clover pollen supplemented with soybean flour reared more brood than those fed unmixed ryegrass, star-thistle, partridge-pea, and clover pollen

alone, the figures being 32,400 bees (over 6 pounds) per pound of supplement against 2,350 bees (about $\frac{1}{2}$ pound) per pound of unmixed ryegrass pollen.

Foreign Parasite Introduction. Special emphasis was placed on the importation of parasites of the vegetable weevil and the cotton boll weevil from South America. A new project for the biological control of the Klamath weed was initiated in the fall of 1944. Large-scale shipments of two leaf-feeding beetles and a root borer that attack this weed were received from Australia. These are being tested on several economic crops, and field releases of one species have already been made in northern California.

Dutch Elm Disease. Operations in connection with the Dutch elm disease control program were concentrated on determining where the disease occurs, on advising elm owners of the nature of the trouble, and recommending ways of combating it, and on testing methods of disease control in selected areas. There was some extension of the known limits of infection, and this afforded a basis for establishing quarantine regulations to prevent movement of host material to areas still clean.

White Pine Blister Rust. The control program was conducted on much the same basis as in 1944, and, in general, accomplishments were about the same. During the fiscal year ended June 30, 1945, over 16 million ribes bushes were removed from 989,372 acres of control area, of which 490,014 acres were initial eradication and 479,357 acres were rework.

INSURANCE. With the sudden and generally unexpected end of the war with Japan in August, the insurance world promptly put into action the plans which had been made to reeducate returning veterans. This has become an important part of the work of these companies in revamping the personnel structure which had been reduced to skeleton-like proportions during the war. Executives of insurance companies were greatly concerned with the world trends, and this was emphasized at the close of 1945, by Dave E. Satterfield, executive director of the Life Insurance Association (formerly Life Presidents' Association) who said: "I warn the leaders of life insurance to stand firm against the fears that are loose throughout the world. Reassert positively and with authority the principles and philosophy of the democratic system. Remember that fear of the future or fear of its uncertainty can induce paralysis menacing those who have been given the responsibility of formulating the policies of the business."

Aside from the change from war to peacetime operations, 1945 saw a great change in the thinking of all insurance executives, as the result of their field coming under the Interstate Commerce laws. Most insurance companies were anxious to put their houses in order and they devoted and are still devoting much time to the task—for they will be under the Interstate Commerce regulations and control on Jan. 1, 1948. If the individual States do not adopt regulatory laws by that time, companies will then automatically be under Federal control. The entire picture has given company executives much concern and they are hopeful that the overall picture will improve during the coming two years.

Life Insurance. The record for 1945 was a great one. Even though the greater portion of the year was in the hands of severely reduced production

forces (these were not effectively increased with the return of Peace), by the end of the year about 71,000,000 policyowners had insurance of about \$154,800,000,000 in force in all so-called "legal reserve" companies. And during 1945 new life policies placed in force in these companies totalled approximately \$15,300,000,000, the highest yearly total since 1931, and a good 5 per cent over the figure for 1944. The companies grouped in the above figures had a total investment in Government bonds of about \$22,600,000,000 in all classes of securities, a figure which is estimated to represent about 50 per cent of all assets.

Marine Insurance. The sudden end of the war with Japan came about at a time when the loss ratio had been reduced, due to the improved situation at sea. Due to this better experience, rates had been lowered, and the companies promptly started laying grounds for the resumption of underwriting marine risks under peacetime conditions. The so-called "Inland Marine" risks (transit, jewelry, fur, and contract "floaters") showed approximately a 10 per cent increase in premiums over those of 1944. This is a sizeable improvement when it is recalled that 1944 produced a new high total of about \$97,500,000 of premiums. It has been found that increased valuations of insured articles has counterbalanced largely whatever reduction in the number of insured units may have occurred.

Fire Insurance. During the year, the New York Trust Company, one of New York's oldest banks, gave recognition to the economic and social usefulness of fire insurance in America. Surveying the financial growth and development of fire insurance, it pointed out 90 billions of dollars of fire insurance is in force country-wide today, more than twice the volume at the end of the first World War. Fire insurance costs have declined about 40 per cent since 1921. From the angle of fire insurance executives, there was great interest in the Empire State Building tragedy, when an Army bomber crashed into it. The resulting heavy damage to the structure would normally have been covered under the "Extended Coverage Endorsement" attached to most fire insurance policies. In this case the owners did not carry this form of protection, as they felt the cost was too high (two cents per hundred dollars of insurance for protection against the risks of damage by hurricane, aircraft, explosion, etc.). Their opinion might be justified by some when it is stated that the rate for fire insurance on the same building was approximately one cent per hundred dollars of insurance. The great loss in this case seems to vindicate the fire companies and the rating bureaus, as the cost of the insurance, in the case of Empire State, would have been dwarfed by the amount of the claim. It now appears that owners of other large fireproof buildings are minus this essential protection—and also because they feel the rate is too high.

As for the 1945 total of fire losses, the experience continued upgrade at an alarming rate. 1944 losses had hit the all-time high of approximately \$410,000,000 and the 1945 figure, according to wholly unofficial reports of underwriters, based on available figures for the first eleven months of the year, will be close to \$500,000,000.

Suretyship. A reduction of 10 to 20 per cent in the basic rates was announced effective May 1, 1945, on bankers' blanket bonds, and bonds for savings and building and loan associations. Also, as of June 15, 1945, general reductions in the basic rates on brokers' blanket bonds, and primary and commercial and blanket position bonds. This

downward trend in the cost is felt to indicate a far wider use in the future of fidelity insurance as a commodity. Even now, the public is indicating a greater interest in this field, and the lowered cost may be responsible.

Air Insurance. A material increase in the premium totals is undoubtedly the result of the widespread interest in air travel, and the general attractiveness and low cost of air insurance. During 1945, there was a large reduction in valuation charges and premiums on air cargo transportation, mainly because of the good performance records for the previous year.

War Damage Insurance. Early in 1945, the War Damage Corporation announced it had once more extended the war damage policies in force on Feb. 28, 1945, for another year from expiration, free of any premium charge. With the ending of the war, the public was happy to forget about these policies. There was some agitation, however, from a few isolated sources, to have the Government refund all or a portion of the premiums paid for this protection from the very beginning. Although approximately \$220,000,000 in premiums is involved, it is felt that to return the premiums would be far more costly than the acceptance of them, due mainly to the small average size of the policies and the tremendous number.

Casualty Insurance. During 1945, there was a substantial increase in automobile collision rates, and this met with the unqualified approval of both producers and companies alike. In New York State the rate increases ranged from 10 per cent to 35 per cent on trucks, and about 33½ per cent on private passenger cars. As may be surmised, the increase is simply due to the large rise in the number and size of collision claims in general, since the removal of gasoline rationing.

There was serious discussion by companies writing compensation insurance, of the problem resulting from industrial concerns employing handicapped workers. Many employers had the erroneous notion that insurance companies would charge higher rates when such disabled workers were employed. This was contradicted in an address before the American Management Association, last spring, by J. Dewey Dorsett, general manager of the Association of Casualty and Surety Executives. He stated that physical defects are not considered in the formulas for determining the compensation rate, and that such employment is not prohibited in any way by the terms of the workmen's compensation policies.

During the year, the possibility of writing "participating policies" (dividend-paying) was explored by thinking members of the insurance fraternity. This would mean a refund or a dividend based either on the general experience of all insurers in a given classification, or based upon the individual experience of the policyowner. Some executives feel this step is inevitable, but it is considered unlikely that any action will be taken during 1946.

There has been some discussion by top insurance executives of the worth of so-called "Automobile Safety Responsibility Laws." New York State having completed about three years under this equivalent of "compulsory" automobile insurance, there was great interest in a wide-open endorsement of safety responsibility laws given by Clifford J. Fletcher, head of the New York Bureau of Motor Vehicles. Commissioner Fletcher said that since the enactment of this type of law in the State, the percentage of insured automobiles in operation has increased from 30 per cent to 80 per cent. In-

insurance producers will vouch for the fact that in all states where these laws are in operation, the enactment has been a stimulant to production of business. Thirty-five states now have some type of financial responsibility law, many of them having followed the New York law rather faithfully.

In general, 1945 has brought about what appears from within to be a spirit of greater helpfulness. The companies realize that from this point on, growth will depend on the degree of service to the policyowner and the extent to which the organization co-operates with the producer of business. This applies to all divisions of the insurance field, and has been particularly noticeable in the life insurance organizations and the casualty companies.

Naturally, it was to be expected during the war years that the depleted forces of the companies throughout the country would not be able to give the same degree of service which was available prior to Pearl Harbor. This difficulty was not confined to the insurance companies but hit every field of commercial endeavor. During war years, the public was forced to "take it"—and did. But, now it is the general feeling that the service angle should once more predominate; and it seemed, at the close of 1945, that the companies are striving to rebuild organizations which will be intelligent, ambitious, conscientious and capable. The postwar educational programs are the first step in the rebuilding process. The desire on the part of the organizations to serve the producers and the public alike, with a view to attracting loyalty from those whose premium-payments support the entire project, seems at this point to be the one factor which should make the insurance field look with hope and determination to the records to be made in 1946.

MERVIN L. LANE.

INTER-AMERICAN AFFAIRS, Office of. The Office of Inter-American Affairs, created by Executive Order August 16, 1940, to coordinate inter-American activities of governmental and private agencies, terminated urgent wartime phases of its programs with the 1945 victories over the Axis powers and Japan, and turned all of its attention to directing its functions into peacetime channels.

By the end of the war for the United States the Office had perfected a hemisphere-wide information service, including press, radio, and motion picture programs and publication of a magazine, *En Guardia*, in Spanish, Portuguese, and French. It was also cooperating with 18 of the other American republics in executing 57 agreements for general hemisphere elevation of basic standards. Of the cooperative field and office programs 18 were for activity in health and sanitation, 8 for food supply and nutrition, 15 for educational activities, and 16 for field missions or advisory functions in railroad rehabilitation, highway construction and maintenance, and port operation.

Five of the cooperative food supply agreements run through 1946, three of these through 1947; five educational and 10 health and sanitation agreements run into or through 1947; six health and sanitation and 10 educational programs run into or through 1948. Functions of the transportation division will run through 1946.

At the inception of the Office, all activities were motivated by two considerations—the emergency aspect of hemisphere defense, and the long-term aspect of economic development of the Western Hemisphere, all based on mutual understanding and cooperation.
